There are specific reasons against this change. The first great reason, in my mind, is that it is inconsistent with the fundamental design of the Senate. The purpose of the Constitution was to create in the Senate a body which would be as unlike as possible to the other House. It was to be a body more secure in tenure, different in the manner of its election, different in its responsibility, more conservative, more deliberate than the other House, which responds year by year to every movement of the public mind and the public feeling. The Senate was established by the Constitution to protect the American democracy against itself. The framers of the Constitution realized that the weakness of democracy is the liability to continual change; they realized that there needed to be some guardian of the sober second thought, and so they created the Senate. This change is to decrease the difference between the two Houses; to make the two more alike; to make the function of the Senate less distinctive, and to reduce the benefit which the Senate can render to the public service.

At times there has been a restiveness in the country over the delay of the Senate; but when you examine the statutes and when you talk with your fellow citizens wherever you may go thruout the country, of whatever calling or condition in life, you will find that the American has suffered not from too little, but from too much, legislation; not from too much consideration, but from too hasty and inconsiderate action; and if you will probe down into that universal consciousness of the people that is never wrong, you will find that there rests a conviction which proves beyond the possibility of doubt that notwithstanding the delay, in the long-drawn-out discussion, in the deliberate and unhurried action of the Senate, it has, during all its existence, performed, loyally and effectively, its duty to the Government and to the people of the United States. Now, this change would tend to decrease the peculiar quality and character of the Senate which has enabled it to perform its duty.

We cannot afford to put the great industrial communities in an attitude where they feel that the honorable obligation of the great compromise of the Constitution has been taken away; while by the change we should also prevent the Senate from having the benefit of the service of a large class of citizens who are specifically qualified by character and training to render a peculiar kind of service especially needed for the purposes of the Senate, men who by lives of experience and effort have attained the respect of their fellow citizens and who are willing to undertake the burdens of public office, but who are unwilling to seek it; men who will accept the burden as a patriotic duty, with mingled feelings of satisfaction at the honor and dissatisfaction with the burden, the disturbance of life, the abuse of the press, the controversies about performance of duty, but who *never* would subject themselves to the disagreeable incidents, the strife, the personalities of a political campaign. This change will exile from the floor of the Senate men who answer closely to many of the greatest names in the glorious history of this body.

It is wholly unnecessary to provide for or demand a reform in the constitution of the Senate upon the theory that the existing system has failed. It is true

that occasionally bad men are sent to the Senate; occasionally a man is sent who would not have been chosen in a fair and honest election by the people of the State; but they find their level and they find it in innocuous insignificance. The basis of my experience and observations has been largely formed while holding executive positions, not as a member of the Senate, and I maintain that never in this world has any institution of government wrought out more successful results than the provision of the American Constitution for the selection of Senators of the United States.

Exercising a power more varied than any other deliberative body in the world; sharing in the legislative and executive and judicial functions; with control over the laws providing for the raising and expenditure of revenue, thru its constitutional power of amendment; with control over the appointments to offices by the necessity of its confirmation; with control over foreign affairs, thru the necessity of its consent to the ratification of treaties; with the function—that highest of all judicial functions—constituting it a court for the trial of impeachments, after a century and a quarter of life, I declare to my countrymen that the Senate of the United States has performed its duty loyally, faithfully and competently, and has furnished to the history of this country a line of illustrious names and a record of great achievement which are one of the most convincing proofs the world has yet had that popular government, thru representative institutions, is a possibility among men.

Now, when we consider the multitude of failures that line the pathway of history, when we consider the multitude of difficulties that stand in the way of successful government, let us pause before we abandon the character and the constitution of a body which has proved itself and been proven as has the Senate of the United States.

When America set forth in her great experiment, the almost universal opinion of the world was that she would speedily encounter the disasters which all attempts at popular government had met before that day. The whole world knew well that the tendency of democratic government was toward frequent change; that the weakness of democratic government was its liability to change with the impulse and enthusiasm of the moment. And since the time when our fathers framed the Constitution half a score of nations, seeking to follow the lines of our experiment, have, in varying degree, and some of them to the last degree of failure, justified such an apprehension. But with us there has been one great anchor, our Constitution. The American democracy bound itself to the rules of right, which are essential to the protection of liberty, and justice, and property, and order, and made it practically impossible that the impulse, the prejudice, the excitement, the frenzy of the moment shall carry it into those excesses which have wrecked our historical prototypes.

Because the American people stand by their Constitution and are unwilling to yield to suggestion that it be tampered with and altered upon slight provocation, every acre of farm land, every farm house and barn, every stock of goods and every manufactory in the country is of greater value, and no change in our Constitution should be permitted to cast a doubt upon its permanency and inviolability unless there be the weightiest and most commanding reasons. All presumptions are against it. The great public policy of a century is against it. A heavy burden rests upon those who wish to make the change. And when a proposal is made to *change the provisions which affect the relations between the States and the National Government,* or to modify any of the terms of one of those great compromises upon which the institution rests, there are special reasons for rejecting it, and a double burden rests upon those who propose it.

No one can foresee the far-reaching effect of changing the language of the Constitution in any manner which affects the relations of the States to the general Government. We enter upon a field of doubt, of new discussions, the end of which no can can foresee, when we begin to tamper with the delicately adjusted machinery to which we have been so long accustomed and which we now understand so well.

Why, then, should we adopt this resolution? There has been but little attempt to assign reasons for the proposed change in the election of Senators. It has been left in the main to rest on the

proposition that the people of the country desire it; that there have been resolutions adopted by many legislatures; that planks have been put in many political platforms. I am, none the less, convinced that the desire of the people for this change, if there be a desire, is not a very active and violent feeling. It is rather a mild assent to a proposition which is suggested to them as an appropriate remedy for certain ascertained and recognized evils. There is a tendency which is natural and in which we all share, that when an evil is recognized, and some one suggests that a provision of law will cure it, our interest is attracted and our support is conciliated for the proposed measure. I believe that what the people really want is to have certain evils which they recognize in the present election of Senators cured, and that they are quite indifferent about the proposed change except as it is certified to them to be a sure cure for the evils. Whether it will be a cure or not has been little considered and little discussed, either by the people of the United States or by the Senate.

These evils which we all wish to see cured consist of certain patent defects in the working of the system of election of Senators by State legislatures. The first is a defect in the working of the law which requires them to select, permitting the deadlock which exists so frequently. It causes dissatisfaction on the part of the people, and, I believe, constitutes the chief reason for the assent of the people to propositions to change the manner of election. But these deadlocks come not from the constitutional provision; they come from our own statute of 1866. They can be ended forever, on any day of this session, thru a simple amendment by Congress of its own statute. The deadlocks arise from the fact that our statute requires a majority vote, and everywhere among people of independence and individual will it is a difficult thing to secure a majority vote. If we chose today to amend our statute so that these legislatures could elect by a plurality, they would elect tomorrow. If we chose to say that in any legislature where a majority vote could not be obtained within thirty days of the beginning of the Congress in which the successful candidate was to take his seat, there should be an election by plurality, in every one there would be an election the day after the period expired.

We have fallen upon times when it seems as if the first thing to be done, instead of the last thing, to cure an evil, is to amend the Constitution of the United States. But this very joint resolution to amend the Constitution will force us to abandon the majority rule and to entrust the election of Senators to a plurality; for never can the Senate of the United States maintain a working force if a majority vote is required for the election of Senators by the people of the various States. In every close State the outlying parties, not occasionally or accidentally, but as a rule, poll more votes than the difference between the two great parties. As a rule, in the close States of the Union, no one is elected by a majority vote. We should not cure this evil by the proposed amendment of the Constitution, but we can cure it absolutely by a simple amendment of our own statute.

Another reason why people are dissatisfied with the discharge of the functions of the States legislatures is a belief that from time to time State legislatures have been influenced by personal considerations or controlled by extra-official inducements in the performance of their duty; and it is true that forbidden and abhorrent forces do sometimes affect the election of a Senator. But it is only occasional, and the great body of members of the Senate are and always have been elected as the free and intelligent judgment of their States legislatures dictated. There is no claim—certainly there is no ground to sustain a claim—that an honest and intelligent legislature, fairly canvassing the abilities and the character of the men who can best serve their country as Senators from their States, cannot make as good a choice, if not a better choice, than an electorate at large. No; the real ground is that, arguing from these exceptional and occasional cases, the people of the United States have been led to believe that the legislatures of their States are unfaithful to their trusts in making their selections.

If this be true, what is the remedy the people of the United States should seek? Are they to abandon the performance of their duty in the election of their State legislatures? The whole proposition

rests upon the postulate of the incapacity of the people of the United States to elect honest and faithful legislatures. If the people of the several States have proved incompetent to select honest and faithful legislators in their own States, shall the Constitution of the United States be so amended as to relieve the people from the consequences of their incompetency by taking from the State legislatures the power to choose Senators of the United States and vesting that power, free from all control of Congress, in the same incompetent hands?

If we recognize the fact that we cannot have honest legislatures, the tide that now sets toward the Federal Government will swell in volume and in power. Let me say to those who are solicitous for the preservation of the sovereignty of their States that there is but one way in which they can preserve that sovereignty, and that is by repudiating absolutely and forever the fundamental doctrine upon which this resolution proceeds. In my humble judgment the most vital thing to be done in the United States today is to strengthen, instead of weakening, the legislatures of the States.

The fundamental proposition upon which this resolution rests is an expression of distrust for representative government. It does not stand alone. It is a part of a great movement which has been going on now in these recent years thruout the country and in which our people have been drifting away from their trust in representative government. The modern State constitutions, which are filled with specific provisions, limiting and directing the legislature in every direction, furnishing such startling contrasts to the simplicity of the Constitution of the United States, the initiative and the referendum, are an expression of distrust in representative government. This resolution is an expression of distrust. And, strangely, this movement comes at the very time when the development of our country, in its business and social and political life, makes it all the more necessary that we should depend, and be justified in depending, upon representative government.

What will become of State legislatures if we follow the principle of this resolution? If we rob them of power, of dignity, of consequence, what will be the personnel of the State legislatures? The boards of aldermen in some of our cities were once bodies of high consideration, filled by citizens of consequence and of high standing, but they have dwindled and shrunk into insignificance as power after power has been taken away from them. Once begin in that direction by taking the first step based upon the principle of this resolution, and we shall find the members of our State legislatures growing less and less competent, less and less worthy of trust, less and less efficient in the performance of their duties. We can never develop competent and trusted bodies of public servants by expressing distrust of them, by taking power away from them, by holding them up to the world as being unworthy of confidence. Men whose standing in their community makes it desirable for the public service that they shall go into our State legislatures will never subject themselves to be ranked in bodies suspected and discredited and deprived of power. Neither is this resolution providing for an amendment an expression of confidence in the people; it is an expression of distrust in the people. It is not progress. It is a slipping back. It is not an improvement in our system of government. It is an abandonment of our system of government.

There is no weaker course for men to take than to endeavor to make up for failure to do their duty by changing the form of the duty. It is a proposition that the people who cannot elect honest men from their own neighbors to their State legislatures can elect honest men to the Senate of the United States. But how can men who are unable or unwilling to perform the duty of selecting an honest and faithful legislator from their own vicinage improve upon their performance in the selection of a candidate in a State-wide election of candidates whom most of them know little or nothing about except what they get from the newspapers?

Why should we consent to any attempt at an evasion of duty? The pathway lies clear before us under the Constitution. If we will do our duty the Constitution needs no amendment. If we do not do our duty you can amend the Constitution a thousand times without any utility. The trouble in the elec-

tion of Senators of the United States is not in the Constitution. It rests with the people. It is because they are not doing their duty. If there be no voice in this land with power to reach the minds of the people with this message, then we are caucusing over idle words when we talk of an amendment to the Constitution. It is wholly unnecessary to abandon the attempt to elect honest legislatures. The whole purpose of relieving and remedying the evil which has led to this agitation for an amendment to the Constitution can be better accomplished without an amendment. Our present condition is only temporary. The process of relieving it is now going on, and is going on all over the land.

Altogether the States exhibit the strivings of a great democracy adjusting itself to the new conditions, and they are bound to result in a successful accomplishment. Experiments will be tried and abandoned, modified or be found successful; but ultimately we shall come back to a new adjustment, under new relations, having all the competency of popular government that existed before. It is an inconsiderate proposal that we make one of the first steps in this great experimental process the irrevocable step of amending the Constitution. I am confident that under the broad terms of the instrument which has been sufficient for all the growth and change of a century and a quarter the process of reform will go on to a successful end, in conformity with the Constitution as it is. But if I am wrong, if at some time or other it becomes needful to amend the Constitution for the purpose of remedying evils, let us amend it after we have experimented, and not at the beginning; let us do it as the result of that experience which brings wisdom, and not as the result of those conjectures which lead to continual change.

WASHINGTON, D. C.

Our Lady of Pity

(Elizabeth Stuart Phelps Ward)

BY KATHARINE LEE BATES

SMILING came she up to Zion as by path well known to her,
Known in longing dreams and visions, traced by sorrow's questing heart;
Smiling as familiar fragrance on the wind was blown to her
From the gardens of her childhood, clover-field and haying-cart.

Smiling as beneath the golden chant of stars that sang for her,
Lost, belovèd voices called her by old, teasing, tender names;
But she turned her from the city, tho the joy-bells rang for her,
Tho the jacinth, sard and jasper beckoned her like rosy flames.

All the way she traveled knew her, blossoming its gratitude
As she sought the stellar outlands, far frontiers of Paradise,
Where the meekest of earth's martyrs find a dim beatitude,
Beasts that for our human welfare paid their suffering as price.

How they flock to her caresses, how her tones are sweet to them,
How their innocency, smitten, bruised, tormented, thrown at last
To the bullring and the clinic, hears dear pity beat for them
In the heart that holds them holy for their anguish overpast!

Every wounded wilding spirit lifteth gentle gaze to her,
Saints too simple for forgiveness, only seeking leave to love;
Shot-torn birds with broken plumage carol blissful praise to her,
And God's grace descends upon her in the likeness of a dove.

WELLESLEY, MASS.

The Cost of a Useless War

BY BARON D'ESTOURNELLES DE CONSTANT

[The author of the following article will arrive in this country as soon as this issue reaches our readers. He proposes to travel to the Pacific Coast and back and will give many lectures en route, especially at our great universities. The Baron is a member of the French Senate, a judge of the Hague Court, a delegate from France to both the first and second Hague Conferences, and last year a recipient of the Nobel Peace Prize. He has often contributed to THE INDEPENDENT.—EDITOR.]

GOVERNMENTS have been singularly favored by a general state of ignorance in their concealment of the consequences of their wars.

I have long tried in vain to learn what the wars of the French Revolution and First Empire cost France in men—without taking the rest of the world into account. The figures vary between two and five millions. But if for the time being I confine myself to the minimum figure and multiply it by several generations, I make out that France has reduced her population by at least twenty millions in a century. Without these wars we could have today about sixty millions of inhabitants; and, presumably, more robust inhabitants, since, apart from the alcoholism which enters into this account, wars have eliminated those best qualified for procreation. But even confining ourselves to the immediate costs of war, we undertake a work of several years in our archives before arriving at doubtful results. It is already difficult to estimate with sureness the number of men actually engaged. For the Revolutionary epoch, it is almost impracticable. Under the Empire, Napoleon mobilized with his armies those of Germany, Poland, Holland, Denmark, Spain, Switzerland, Portugal, Italy—even those of Croatia and Dalmatia! And for a considerable time at least these foreign legions remained faithful.

Also, how are we, on the other hand, to estimate how many survived of those engaged? By footing up the dead, the wounded, the prisoners, the missing and the deserters? The hospital service existed only in an embryonic state; after the retreat from Russia, what was left of it? And even the administrative service, admirable tho it was, suffered, like everything else, from the general disaster. Who could total the losses, no longer on the field and in the hospital, but along the roads? The enormous number lost during the five years of the Spanish war has never been known (it was estimated at 473,000); nor the numbers lost in naval warfare, aboard English and Spanish prison ships, in the West Indies, etc.

During the retreat from Russia, the Grand Army was destroyed day by day; and of most of its corps only fragments returned, with their treasures and archives lost. According to Count Labaume, whose figures follow, of 680,500 men mobilized, 400,000 crossed the Niemen; but scarcely 20,000 recrossed. Most historians make the figure 18,000. Let us call it a loss of 380,000 men; almost the entire army on one side only, and in Russia alone.

To these losses must be added those which the troops suffered going and coming, outside Russia, from their point of departure (Spain) to their original garrisons. Napoleon had been obliged to occupy all Germany. Davout, after the Russian campaign, did wonders to maintain himself at Hamburg—but at what cost! He arrested there an army of Swedes, of Prussians, of Russians, and retired only on orders received from Louis XVIII, Napoleon's successor. What did the French campaign cost, which followed upon that of Russia? And Waterloo? We can arrive at no certain knowledge of all this.

Historians assure us that the corps of Prince Eugene, upward of 52,000 men, did not number above 1,200 at Marienworder, fourteen days after crossing the Niemen in its retreat.

Imagine, besides, the immense field of action lost by the French, particularly in the New World, while twenty-five years of war absorbed the courage, the heroism, that war did not create, as some think, but which existed and demanded nothing better than that it be spent, at home and abroad, on enterprises already

undertaken. Altho abandoned after the Seven Years' War, the work of Cartier, of Champlain, of La Salle, and, later on, that of another order, not less great, of La Fayette and Rochambeau, had prepared fruits for French initiative to pick, in spite of all: that is, expansion, the multiplication of our energy, of our commerce, the salvation of our marine, of our ports, of our fleets; for our influence and language were everywhere at work. But we cut these bonds; we ceased to send into the New World the vivifying blood of France in order to soak the battlefields of Europe with it.

THE CORPS CONSTITUTING THE GRAND ARMY SENT AGAINST RUSSIA, MARCH 1-SEPTEMBER 1, 1812.

General Staff.....	4,000	French, Hessian, Saxon, etc.
First Corps.....	83,000	French, Hessians, Poles, Spaniards, etc.
Second Corps.....	44,000	French, Croatians, Swiss, Portuguese, etc.
Third Corps.....	43,800	French, Portuguese, Wurtemburgians, etc.
Fourth Corps.....	52,000	Made up almost exclusively of foreigners, commanded by Prince Eugene, Vice-regent of Italy.
Fifth Corps.....	39,500	Almost exclusively Poles, commanded by Poniatovsky.
Sixth Corps.....	27,400	Almost exclusively Bavarians.
Seventh Corps.....	18,900	Almost exclusively Saxons.
Eighth Corps.....	18,700	Largely Westphalians.
Ninth Corps.....	32,500	French and various German nationalities.
Tenth Corps.....	31,400	Chiefly Poles, Prussians, and Westphalians.
Eleventh Corps.....	31,400	French, Hollanders and various German nationalities.
Austrian Corps.....	30,000	Austrians, etc.
1st Cavalry Corps..	13,400	Some Poles and Prussians.
2d Cavalry Corps...	10,400	Some Poles and Prussians.
3d Cavalry Corps...	10,600	Some Bavarians and Saxons.
4th Cavalry Corps...	7,800	Poles, Saxons, Westphalians.
Imperial Guard.....	51,300	French with one Polish regiment.
Grand Artil'ry Corps	22,400	
Garrisons of Magdeburg, Dantzig, Kœnigsberg, and Hamburg	14,600	
Division of the Princes of the Confederation	7,300	Foreigners.
Neapolitan Troops...	8,000	Foreigners.
Danish contingent...	9,800	Foreigners.
Troops on march...	43,000	Foreigners.
Gen'l Cavalry dépôt.	1,500	
Total	680,500	

This total of 680,500 men was, you understand, increased to repair the disaster of the retreat from Russia, to assure the return to France across Germany, and to defend France — till Waterloo. And to these formidable figures let us not fail to add those of the allied armies which followed ours to Paris, and sowed, as they went, they in their turn, death and desolation.

"In that year 1813, from January 11 to October 7," writes Chancellor Pasquier, in his *Souvenirs inédits*, "840,000 men had been demanded of imperial France and had, perforce, been delivered." Other decrees, in December, put 300,000 conscripts at the disposition of the Government; a November decree organized in cohorts 140,000 men of the National Guard. In all, *one million three hundred thousand men called in one year!* Ségur, charged with organizing and commanding a company of young men, writes: "There were some of them of so weak a make-up that they seemed dying." Half of them perished in the 1814 campaign.

Shall we now, under the reservations exprest above, and only tentatively, oppose to the table of men engaged a statement of the losses suffered?

Let us try. According to Taine, Napoleon said vehemently to Metternich, in the course of the famous eight-hour interview at Dresden, June 28, 1813: "What do you want of me? That I do myself dishonor!" Metternich dared to reply: "I have seen your soldiers; they are children. When this army of adolescents is gone, what will you do?" It was then that Napoleon was beside himself and replied: "You are no soldier and you know not what passes in a soldier's soul! I grew up on battlefields, and a man like me doesn't give a tinker's damn for the life of a million!"

Another day, according to Taine once more (he cites the Duc de Broglie), Napoleon said to M. de Narbonne: "When it comes to that, what has the Russian campaign cost me? Three hundred thousand men; and besides them, there were lots of Germans there."

"His imperial chimera devoured many more, besides," adds Taine. "Between 1804 and 1815, he had been the cause of killing more than 1,700,000 Frenchmen, born within the boundaries of old France, to whom we must probably add two millions of outlanders, killed for his sake either as allies or as enemies."

The total of French losses at the battle of the Moskowa is generally stated as

30,000 men, the Russian losses as double that; almost 100,000 men for the two armies—as a beginning. In the manual entitled "Cours d'histoire" (edition of 1904), used by the pupils at St. Maixent, which agrees here with Lavisse and Rambaud, almost word for word, we read:

"At Wilna, 30,000 of our forces were massacred by the population."

Marshal Ney covered the retreat. At Kowno, where he recrossed the Niemen, he took command of the rear guard at the head of what infantry survived. He ended by arriving, all alone, at an inn in Prussia: "hunted cross country like a stag in a chase."

The more my Russian travels awakened in me the recollection of my readings and of these terrible events, the more did the contrast impress me between the popular joy, unanimous as it was in its Franco-Russian manifestation, and the horror of these relatively modern wars that threw at one another, for no cause, the armies and the populations of two ravaged countries. This contrast did not fail to strengthen in me the conviction that the *soi-disant* bellicose spirit of peoples has often been, in the last few centuries at least, only a governmental invention.

The bellicose spirit, or, rather, the spirit of conquest—for we do not speak of civil or religious wars, or wars of independence, or race wars—has had, so far, two cardinal principles:

1. Ignorance of the useless and inevitable atrocities of war: The truth about war has never been taught in schools, for the reason, it is said, that this truth might detract from the prestige of governments and destroy the confidence with which their sentiment of humanity or at any rate their simple good sense ought to inspire the masses.

2. War was long waged only by professional armies.

The children of other people were mobilized to go and take possession of other people's goods. Quietly and in proportion as the goods of other folk are defended by the general need of security and by the organization of the Society of Nations; quietly and in proportion as the armed nation in its entirety shall be charged with defending the national territory and with invading at need that of the aggressor, war will be treated less and less lightly, especially if history presents it in its truth and in all its consequences, not under the commanding appearances that official artists and writers have too often given it.

My final conviction is this: I have never attached great importance to the sentimental protests against war. The essential thing is to teach the nations by facts and by making them understand their own interests. They will find then that this interest accords with duty.

If only all Frenchmen might have read a sincere history of the Russian campaign, and then the history of 1813; next, that of the campaign of France; finally, that of 1815! And if, on the other hand, the foreigners could have done as much! These histories, incomplete as they are with respect to the true causes and the true consequences of war, do exist. They are highly numerous; several among them are beautifully done and some few deeply moving. Their reading is more eloquent and more decisive than all the pacificist pleadings.

In addition, by a paradoxical but happy compensation, to make up for the defects of history as it is taught, it is the novel, creator of so many legends, that has been charged with bringing to bear upon opinion the truth which we seek: this altogether simple truth born of obscure recitals by victims and witnesses; born of the tears of mothers, of the maledictions of consciences; heritage left by the multitude of victims of "the genius of great captains." Let the novel be of the brothers Erckmann-Chatrian or of Tolstoy; there is the same desolation, the same lassitude and the same revolt; and this protest of the novel has bridged the great gap of history.

This gap will speedily disappear. The peoples uniting among themselves have traversed not only the distances, but also the abyss of error, which have separated them; they will soon discover that they have been thrown against one another as combatants without motive, without profit, for the unique service of blind ambitions.

Men say, "History repeats itself"; yes, because we are ignorant of history. But little by little we shall learn. And cursed be those who may seek to begin it over again.

PARIS, FRANCE.

From Browning to Bridge

BY SUSANNE WILCOX

IT is commonly conceded that the average American man is chiefly occupied in pursuing the dollar; but one often wonders how to label the pursuits of the middle class American woman.

How does she spend her leisure? Does she share her husband's interests in the game of getting what she spends? Rarely. Sometimes she knows approximately what he makes, but generally the American business man does not explain his business machinations to his wife. If he gives her sufficient with which to dress herself, to eat, and to decorate her house to her taste, he considers that he has fulfilled his whole duty. His leisure is occupied chiefly in reading or discussing politics or sport. Again, does he share these interests with womankind? Rarely. According to his notions these are not womanly interests and he prefers to discuss them with his fellow men.

On the other hand, with what does the middle class American woman concern herself? Housekeeping is no longer so interesting or important to her as when she compounded the elemental supplies and felt herself the mainspring in the household; and modern conveniences have almost reduced housekeeping to mere mechanical routine. Moreover, a little education has whetted her appetite for something a little more diverting than mere humdrum housekeeping; and conventional class and sex restrictions have gradually inhibited her more and more.

In fact, outside of the "smart set" she has virtually been segregated in social relations. For instance, at any mixed gathering it is usually conspicuously noticeable that groups of men and men, and women and women, are talking together; or should a man and his wife go out together to make an evening call, presently, after an exchange of a few commonplaces, the man caller and the man upon whom he is calling begin to converse and appear to take for granted that the women present have neither interest nor understanding of the subjects they wish to discuss. Consequently the women soon draw together and converse by themselves.

The middle-class French woman and her husband are good comrades; she usually understands his business and frequently takes active part in it; their side interests and diversions they share in common, nor would a Frenchman's sense of politeness permit him to shun women in conversation as the American man commonly does. So is it, we are told, among Italians and Russians. Even the traditionally tyrannized-over English woman appears to share vastly more in common with English men than the American woman with American men. At least she has been expected to interest herself in public affairs, and not only is she permitted to discuss such matters without being considered unwomanly, but she has for years been utilized to assist in campaigns and elections even tho she has not been granted equal suffrage and even tho many of the English laws concerning women are still barbaric.

But the American woman is given no such license. To be sure the American man has a habit of boasting of the freedom and virtue of the American woman, but in reality he does not take her very seriously. He indulges her in allowing her to spend as much of his income as she chooses, whether she chooses to spend it wisely or foolishly. He also leaves the rearing and disciplining of the children entirely to her. In short, he is commonly an amiable, regular boarder in his own home, but usually does not live in real companionship or comradeship with his wife or with womankind in general.

Meanwhile with what has the American woman been occupied? Apparently about thirty years ago she resolved that she would at least be educated; that she would devote her leisure to acquiring the refinements of life, since to this her husband did not object. Promptly she set about organizing women's clubs, chiefly for the purpose of collective study and

for personal improvement; and for at least two decades these clubs thrived and multiplied. But her taste for learning was ostensibly not very definite or profound, for the programs of almost any of these clubs have indicated very shifting, shallow and circumnavigating tendencies, so that while she has been learning a little about everything she has learned nothing very well, nor has she acquired an abiding interest in learning for its own sake.

Her husband, on the other hand, has been diligently reading the newspapers, and a few popular magazines, and at least he knows and understands something of the tendencies of the times; nor has he been deceived or alarmed by his wife's widespread intellectual efforts, while she herself has manifestly grown weary of sponging up bits of knowledge. Nevertheless, the habit of gathering together and of partaking of mild refreshments has grown upon her. Indeed, one may say it has become a fixt habit. And while many of the literary clubs are still fanning to keep the dying sparks of intellectual interest alive, others are beginning to occupy themselves with the practical affairs of civic housekeeping, yet purely social gatherings of every sort are increasing. This peculiar kind of activity is of course more particularly characteristic of smaller towns and cities. In the larger cities, we are told, middle class women get a similar sort of social dissipation in shopping day after day, even though they have little or no money to spend.

My own observations have been confined largely to my own community—a Middle West college town of 10,000 inhabitants, and perhaps of more than average intelligence. The number of women entirely supported by their husbands and who have more or less leisure does not exceed four or five hundred; the average number of children to each family in this class, computed from a table of a hundred families, is 1.62. The various clubs and associations in the town to which few outside of this circle belong are: The Council of Women (affiliation of clubs), W. C. T. U., Woman's Club, Sorosis, Cemetery Association, Wednesday Club, Unique, Nineteenth Century, Charity Association, Y. W. C. A., Woman's League, Tri Kappa, Kappa Alumnæ, Conversation Club, Friday Musical, Kappa Alpha Theta Alumnæ, Social Club, Psi Iota Xi, Navajo Club, Free Kindergarten and Sewing Club, Eastern Star, Daughters of the Revolution, Daughters of Rebecca, Woman's Relief Corps, and four regular bridge clubs—twenty-nine in all—besides the various church associations.

At present we are in the thick of the social season, which begins early in October and ends about the middle of July. The following is a list of social functions which incidentally I jotted down at the beginning of the season:

Oct. 31.—Mrs. Cordial—Bridge (afternoon)
Nov. 1.—Mrs. Cordial—Afternoon tea.
Oct. 31.—Mrs. Rouge—Bridge (evening).
Nov. 1.—Mrs. Rouge—Bridge (evening).
Nov. 2.—Surprise Party to Mrs. Kruli
Nov. 3.—Mrs. Line—Bridge.
Nov. 4.—Mesdames Havell and Briggs—Reading and Music.
Nov. 5.—Mesdames Havell and Briggs—Reading and Music.
Nov. 8.—Mrs. Slater—Bridge
Nov. 9.—Mrs. Slater—Music and Reading.
Nov. 10.—Mesdames Hall and Ringer—Thimbles.
Nov. 11.—Mrs. Beason—Bridge.
Nov. 11.—Mrs. Caldron—Bridge (men and women).
Nov. 12.—Mesdames Mallory and Haris—Bridge.
Nov. 12.—Mrs. Van Dusen—Bridge (evening).
Nov. 14.—Mrs. Koss—Thimbles.

Men were present at but one of these gatherings. But it seems obvious from these limited data that the American man's all-absorbing interest in business and money-making is paralleled in the American woman's taste for mild dissipation. Not that she is bubbling over with spirits or trying to find an outlet for great passions or enthusiasms, for she has no very strong or definite ones, but rather her interests are so few and so feeble that she is manifestly bored with them and with herself and has taken refuge in a ceaseless round of bridge and thimble parties, receptions, clubs and teas.

Not long since I myself decided that I was living too much apart, becoming unsocial and missing a great deal of enjoyment merely because I could not play bridge, so with the assistance of a friend I set diligently about learning the game.

Shortly afterward I was heartily welcomed at a bridge party, and several of my friends seemed greatly pleased because I had at last learned to play. When the playing began, I found it difficult to concentrate my attention upon the game, so much was I imprest with the keen interest and zest with which most of the women present were playing, for with most of them I had long been personally acquainted and had long since concluded that but few were capable of having a very live interest in anything. Indeed this steady, silent, absorbed concentration seemed to reveal new possibilities in them.

At our table there were almost no remarks until the end of the first rubber, when my neighbor, Mrs. Rater, turned reproachfully to my partner, Mrs. Dusen.

"I hear you've resolved not to play oftener than once a day hereafter."

"No; Mr. Dusen and John don't like me to be away from home every evening," was my partner's apologetic reply.

"Well, it's queer," continued Mrs. Rater, "but you know when I play in the afternoon I feel as though I must play again in the evening. Of course I can put the children to bed before leaving home. As for Mr. Rater, he doesn't mind being left alone, because he generally spends the evening poring over the newspapers and magazines and rarely has a word to say if I do stay at home."

"For my part," sharply interposed Mrs. Rouge, "I just won't stay at home night after night alone. Mr. Rouge goes down town every night to play pool, so when there's nothing doing I always invite a few in for a game."

At the next table was my friend, Mrs. Tremont—a bright, charming little woman who a few years ago was reading and studying a good deal, and in a large measure had emancipated herself from the social swirl.

"What are you reading nowadays, Mrs. Tremont?" I asked presently.

"O dear me!" she laughed derisively, "social life is so strenuous these days, I don't pretend to read any more. If I scan the topics of the newspapers and dip occasionally into a magazine I feel as tho I'd done well. To be frank, I think we've all become demoralized. Why, I scarcely get time to take the baby for an airing any more."

"How about you, Mrs. Snobgas?" I inquired, turning to our new social leader, recently from the East. "Are you also so devoted to bridge?"

"Oh, just wild about it!" she replied, exultantly. Then in a low whisper to me, as tho we understood each other perfectly. "The only thing I object to here is that one is forced to play constantly with so many trades people."

"What puzzles me," I continued, "is how you bridge enthusiasts manage to pass your Sundays, since all of you are good Sabbatarians."

"O, we go to church," said one archly. "And have our own methods of readjusting our consciences on Sunday afternoons," quickly winked Mrs. Snobgas.

When I moved to the next table, the three ladies waiting were whispering together excitedly.

"Have you heard about Mary and Margaret Hartbell?" whispered one to me with an air of great moment.

"No," I replied a little anxiously; "has anything happened to them?"

"O no, only yesterday their grandmother, who lives at Larkington, died, and after taking their mother to the train, they both went to a bridge party in the afternoon and again in the evening."

I made no reply, but turned to Mrs. Jones, whose child had been very ill for some time, and inquired, "How's the little daughter now? Every one has been so anxious about her."

"I think she's some better," was the placid reply. "We've a good nurse now, you know, so I feel perfectly safe in leaving her any time."

Directly, the playing was over and the prizes awarded, whereupon every one began to chatter at such a rate I was quite bewildered with the whirr. Little Mrs. Lacey, next whom I was then sitting, appeared to be the only silent one in the room, and she plainly was moody and distraught.

At length her partner, Mrs. Walker, stopped short in the midst of a voluble recital of one of her neighbor's dauntless and somewhat ridiculous efforts to get into the social set of the town, and turned to Mrs. Lacey apologetically.

"I'm sorry I played this game so

badly, Mrs. Lacey. I believe you'd have won the prize if I'd played better."

For a moment I thought pretty Mrs. Lacey was about to cry, but presently she sighed in her pretty pouting way and replied, "O, I never mind when I don't win. I always take consolation in thinking that 'Curly' loves me."

The latter remark she addressed directly to me, so half humorously I inquired, "Who's 'Curly,' Mrs. Lacey? I've never met him."

"Really, don't you know 'Curly'?" she replied in all soberness. "He's the dearest, most adorable little dog you've ever seen. So intelligent. Understands more than a child. Why when we speak of going out, we have to spell the words, or 'Curly' runs to the door and whines and sobs like his little heart would break. I tell Mr. Lacey the little fellow will soon know how to spell if we don't take care."

"It does seem a pity, doesn't it?" rejoined Mrs. Walker sympathetically, "that some poor stupid children couldn't have been given the intelligence of some of these wonderful dogs."

The refreshments served presently were delicious and every one seemed to be having a very good time; but somehow I went home later feeling very much depressed without knowing quite why. I realized that it would not be fair to judge the general run of conversation at these gatherings by what little had come within my range, but I realized furthermore that while the majority of these women were not getting contentment or any very satisfying pleasure from their vapid dissipations, yet it would be almost impossible to arouse such interest and enthusiasm in any public movement, no matter how worthy the cause.

In the estimation of most of them a woman who interests herself in public affairs is queer or mannish; a woman interested, for example, in socialism implies to them that she is necessarily an anarchist—a Carrie Nation, who wishes only to go about throwing bombs instead of swinging the hatchet. As for women interested in equal suffrage, they must be of a similar stripe; at least they cannot be womanly. Indeed, the great body of them appears to be obsessed with the fear lest they be considered unwomanly. Tho, as a good, substantial woman who has done her duty to a large family and found time to do much needed public good recently said to me: "When one considers what the 'womanly women' are doing, thinking and talking nowadays, one really wishes to be considered unwomanly, at least from their point of view."

Almost any of these same women are ready at any time to complain to a willing ear of their difficulties to procure a maid or "help," but even though they know that twenty of their number may be competing for the services of one incompetent housemaid who is willing to give only a few hours of her time each day, nevertheless they would not lend themselves to any serious effort toward trying to solve the problems of eliminating servants, to which they will shortly be forced. This sort of activity would not be in keeping with the present day womanly woman's code of life.

A few years ago many more of this class were reading and exchanging books and their ideas about them, but it is difficult to understand how at present they can have many ideas when they are taking in almost no mental pabulum for assimilation.

Occasionally, it must be granted, some few show an apathetic interest in some public movement, but rarely enough to join hands and give it any positive, sustained support.

On the other hand, there are a few women in the community who have been courageous enough to interest themselves in some of the most obvious and pressing needs of the town, like cleaning up the filthy streets, providing sanitary conditions in and about the schoolhouses, and establishing a juvenile court, yet their efforts in the main have been treated with indifference or scouted by both men and women.

Not long since, in commending the services of several of these women to a friend, she suddenly interrupted, "Yes, all you say of them, I grant, is true, but I tell you the men don't like those women."

This unquestionably gives the clue to the inertia of a great many women who will take no chances of having men—no matter how thin-skinned or shoddy they may be—disapprove of them. Frankly, the average business-engrossed, money-making American man, who rarely im-

bibes an idea outside of a newspaper, prefers a woman a little simpering, a little shallow-minded, at least until he is married to her; then, when the diamond dust on her butterfly wings is blown off, he manages to put in very little time with her.

Again, I have repeatedly heard women of this class complain of the dulness of their lives and express their disgust with the wholesale waste of time, the vapid conversation, the flippant and sometimes merciless criticism of one another; tho they appear not to have sufficient energy or courage to resist the social tide.

In truth, if a woman does not fall in line with the conventional social regime, unless she be particularly apt at sprinting a barbed wire fence, she is almost certain to be jabbed or scratched. Sometimes I have thought that our community is in some of these respects worse than others, but I am told that we are no better or no worse than the average community. In the East the life is possibly a little more sluggish, but fundamentally not different.

Perhaps the most conspicuous instance of a woman determined to lead her life on her own plane, in spite of the combined prejudices of a community, came to my notice in a small Eastern suburb.

Some years ago a professor and his family went to live in this attractive locality. The professor and his wife—contrary to the habits of most professors and their wives—were good comrades; appeared to share most of their interests in common, and to take life and themselves a little seriously. Ostensibly the community did not object to the professor taking life a little seriously, but agreed that it did not beseem a woman and it should not be tolerated in her.

In visiting this community I have been interested in hearing the charges against her, and of the petty, and in some instances cruel, persecution to which they deliberately subjected her.

The gist of her misdemeanors was that she preferred to talk with the men and did not enter very heartily into the interests of the women of the community, and in spite of all they could do she persisted in discussing books, public affairs or some subject in which she was immediately interested. For this she was condemned as pretentious, tho as a matter of fact intellectual modesty is not the crowning virtue of some of the leading members of this community.

But her worst offense, for which she seems to have won everlasting disfavor with the Southern element there, was for having ventured to say during a discussion on the negro question that she believed one of the best ways of solving the negro problem was first to educate better the whites of the South. In fact, the more evidence I have heard against this woman, the more my sympathies have been stirred in her behalf.

In time, however, the professor and his wife practically withdrew from this community; or at least, while they kept up the appearance of good fellowship, they limited their intercourse to the barest casualties, and quietly continued to pursue their own interests, for which naturally they were yet more cordially disliked.

At length the professor received a call to another university, and after becoming settled his wife wrote a kindly letter to her acquaintances in the old suburb. To this the neighborhood replied in a common letter, and, as the leading man in the community proudly informed me, collectively insulted her so that she might never again have any doubt as to what the neighborhood had thought of her.

This, to be sure, is an extreme case, but it is indicative of what may happen to any American woman who dares to break step in the commonplace social run. Unquestionably there are women endowed with supreme tact and courage who are able to resist the forces about them; who appear to fit smoothly into the social web, yet resolutely mold their habits on their own dies.

Again there are others who would prefer, almost above all else, to devote their leisure to useful service, to live a little more seriously, to feel that they are contributing something toward some worthy achievement, yet they lack initiative, and fear above all else to brave conventional opinion, so continue day after day to drift aimlessly with the shoal.

Of course one would not wish to see a mannish, aggressive, militant type developed among us; the really womanly virtues should be encouraged before all else; but at times one is forced to con-

clude that we have formed the habit of confounding shallowness, superficiality, even mawkishness, with genuine womanliness.

And unless the middle class American woman does take a firmer hold on things; does learn to order her life a little more independently of the common conventional run; does cultivate some interest in public affairs and more public spirit as well, without being afraid of petty criticism or ridicule, her life will become yet more detached, she will be taken less and less seriously, and will be yet more shunted by men, and yet more debarred from participation in real affairs. In a word, as an eminent professor at a sociological meeting some time ago a little pompously affirmed, "The American woman must first qualify if she wishes to be admitted to the universal brotherhood of Machiavelli."

Alsace and Home Rule

BY NORMAN ALLISTON

EXCEPT for the waiter, whose dexterity—whose art, I ought rather to say—in serving out the chicken in a lurching train was obviously French, the dining-car seemed to be full of English people. And, as far as I could judge, they were all of them going to Switzerland on business. On the thru trains from Boulogne to Bâle and Berne, this indeed is usually the case at the present time of year; they are monopolized by parties of English people bound for the Swiss winter sporting centers. In any case, when we arrived at the German frontier at 4 o'clock on a very cold morning, I was the only one on board the train obliged to get out and submit my baggage to the inspection of the domineering Teuton, my destination being, not Montana or San Moritz, but Mulhouse, in Alsace.

Mulhouse being one of the three principal towns of Alsace, I was under an innocent impression that I might there hear something at first hand about the "home rule" provisions that are being offered to the provinces. I ought to have known that, in this age of publicity, of newspapers, of guide-books and encyclopedias, you can learn much more about a place and all its affairs by staying away than by going there. If you ask an Alsatian what he thinks of the new constitution which is to be doled out to his country, he shrugs his shoulders, as if the whole thing were too much trouble to think about. People do not talk politics here; they are too much disgusted with them. From the point of view of the Alsatian, the new constitution, so called, will be a mere farce, and while the granting of it may have an imposing appearance of graciousness, it will in effect leave things as they were before. Nay, the measure in many quarters seems to be regarded, not merely as something that will do no good, but with positive distrust as likely to do harm. Some say that they would rather see Alsace-Lorraine annexed to Prussia, and have done with it. Nevertheless, at the time of writing—a few days before the debate on the subject in the Reichstag—it seems probable that the constitution, hollow and illiberal as it is, will be accepted, *l'opinion du pays* having been officially brought up to the mark. The Alsatians themselves have never really been consulted in the matter, but it is represented that native opinion is in favor of the proposed measures.

But what, then, is the grievance; what does Alsace-Lorraine want; what would the people be satisfied with? The two provinces would wish to be put on the same footing as any of the confederated states of Germany. They claim that they are entitled to the status of a Wurtemberg or a Bavaria, tho naturally they do not want a German king to be foisted on them for the purpose. They claim to be allowed to develop themselves along congenial and national lines, and to be relieved from the degrading tutelage in which Germany continues to hold them.

The bitterest pill that the Alsatian has

to swallow is compulsory service in the German army. And undoubtedly it was a grave mistake of Bismarck's not to have seen that, in compelling the young generation of the place to wear the uniform of the victors immediately after the war, he was encouraging emigration, and creating intimate bonds between those who left the country and those who stayed. All the young men here who can possibly manage to do so leave Alsace so as not to have to serve in the German army. At Belfort, just across the frontier; at Nancy, Troyes, Epinal and Paris, there are upward of 35,000 Alsatian self-exiles of this description. It is only natural that these, in communicating with their homes, should praise up the liberties and privileges that they enjoy, and so foster a spirit the very reverse of that which Prussia would like to see grow.

The Germans have now had forty years in which to Germanize the provinces, and they have signally failed. It is due to their clumsy way of going to work, to their entire tactlessness: they may know how to govern themselves, but certainly not how to manage others, how to colonize. Their regulations are all on the literal, the petty, the oppressive side; and they try to force a plant which may grow of itself, but will never thrive otherwise. Their surveillance has a Russian flavor. If some merry fellow gets the band to play the French national anthem, the police bear down upon him, and he is expelled the country the next day. If some war veterans assemble together, the meeting is broken up, and the rifles that they used in the campaign are taken from them on the pretense that the firearm licenses have not been paid. All sorts of minor formalities are rigorously enforced. Certain Alsatians who left the country at the time of its cession have leave to visit it for three weeks in the year; if they omit to obtain the necessary police certificates for this, they are ordered to leave at once. Others who come on business are obliged to make appointments for their clients to see them at the station, as they are not allowed to enter the town. Parents are not permitted to send their children to any educational establishment abroad without special authorization, and this is only accorded under unusual circumstances, and very rarely then. If they do so without the due permission, they are liable to a fine or imprisonment. This regulation is made, of course, so as to prevent children learning French, and forms a good example of the clumsy expédients of the Germans.

This sort of government naturally comes as an insult and oppression to the natives, and simply makes the rulers and their nation cordially hated, for they show no confidence in the people. As it is said, the victors in the war have not even had the good grace to make it forgotten that they were the victors. Nor will the new bill mend matters, by all accounts. The first chamber, as it will be constituted, will never be a truly representative Alsatian assembly, and the probability is that it will find itself in constant conflict with the second chamber. Between the two, the native is likely to relapse into his previous indifference to public affairs.

The battle of the languages still continues in the country, despite the enforcements I have mentioned. In the streets of this town you hear French, German, and a barbarous patois which is neither one thing nor the other. In the shops you may make your purchases indifferently in either language. At the theater some representations are in German, some in French. And you may have your morning news, too, in either form, or even in both forms together in one and the same paper. The street names, together with the numerous *Achtungs, Warnungs*, and other notices of which the Teuton is so liberal, are of course all put up in German, but are still referred to by the good Alsatian in the original. Hence in addressing a letter to this gentleman, you must write:

Monsieur Tel et tel Rue du Sauvage Mulhouse, Alsace.	Monsieur Tel et tel not Wildenmannstrasse Mülhausen in Elsass, Deutschland.

I will add that there are large and numerous barracks in this town, and that three regiments are quartered here. The officers, in their well-tailored coats, are much in evidence.

MULHOUSE, ALSACE.

Legislation—Ill-Conceived and Ill-Considered

BY JAMES FRANCIS BURKE

Member of Congress from Pennsylvania and Chairman of the Committee on Education.

IS the making of laws really becoming a popular industry rather than a necessary incident in the United States? There are conditions which certainly justify the impression, in some quarters, and give a semblance of ground for the charges more and more frequently made, and the suggestions that legislation should cease, for a time, giving the country a chance to progress undisturbed.

There are certainly no positions to which men are called which mean so much to the nation as those for making and interpreting the laws, and in no other nation of the earth are the lawmakers' duties more sacred than in ours, because of the vast number of people and of the great diversity of interests affected; and it is certainly true that never were influences tending to elevate and dignify legislation more essential to our national well-being than they are today.

While every law necessary to regulate the rights and protect the property of the people should find its way to perfection in our statutes, there is nevertheless great danger that the constant accumulation of statutes, ill-conceived or ill-considered, in both the State and the nation, reaching out unnecessarily to touch almost every imaginable topic, will ultimately become a menace instead of a blessing. More and more each temporary clamor makes a mad effort to crystallize itself in law, and if this should continue and increase, the accumulation of statute books would soon become a vast monument to the passing follies of the time.

For some years past, whenever a storm has threatened about our ship of state—or even a cloud has darkened the distant horizon—there has been a strong tendency among the passengers to demand that we sail with the wind. They have become easily excited, in both State and national jurisdiction, forgetting the chart set by the trained, clear-headed mariners of one hundred and thirty years ago, by which we have thus far avoided the rocks and kept the ship upon her journey toward brighter days and better things and constantly increasing prosperity. They would set new courses, locally and federally, and they rush to the legislatures for new laws and hurried legislation, and to the courts for new interpretations, without any appreciation of the grave duty devolving upon every man familiar with the philosophy of the law and the real significance of constantly changing the rules already established for the regulation of society.

The curbing of this tendency—readjustment or reconstruction, as the case may be—does not rest wholly with the legislature, any more than the responsibility for unwise laws and dangerous legislation rests wholly there. While it is a crime to create senseless clamor, it is cowardly to yield to it. But courage and faithful public service go hand in hand—courage to do that which time will prove wise and just, regardless of passing prejudices and passions. The value of the people's representative in this crisis depends largely upon the confidence the people have in his judgment and his particular brand of political ethics. It is much easier to shatter a reputation than to make it. It is much easier to demand dangerous legislation than to give credit to those who oppose it.

In the ranks of those whose thoughts never go beyond the surface of things there is frequently found a kind of inherent prejudice against public officials. Demagogs delight to indulge in direct and implied impeachments, and their thoughtless followers quite as willingly applaud. Those who make and those who administer laws suffer much unjust criticism nowadays. It is one of the penalties incident to power. The more

vehement and vicious the criticism, the more widely it is read and believed. The appetite for extravagant expressions of abuse is never so satisfied as when feeding on the attacks on public men. It is a serious matter for any man to stand against the demands of popular agitation, however obvious it may be that they are leading the community astray and into dangerous legislation.

In addition to the influence of thoughtful men in public life, a most effective agency in curbing the popular tendency to exaggerated thought lies with those who are directing the great magazines and newspapers of the country, impressing upon the thoughtless a knowledge of the real meaning of law; a knowledge of its real virtue and necessity; a reverence for its actual and literal observance, and abhorrence of its evasion or violation; a contempt for the growing tendency to treat it lightly or thoughtlessly and to shift the styles of statutes as the garment maker seemingly shifts the shapes of the daughters of Eve with each succeeding season.

This modern lust for legislation is asserting itself in nearly every State of the Union, and is nowhere more manifest than in its clamor at the doors of Congress for instant cures of every passing ailment of both the body physical and the body politic. Examples of freak legislation are becoming far too frequent both in Congress and in the State legislatures. One of our State legislatures actually attempted the passage of a law making ground hog day a legal holiday. A new member of another, in his desire to accommodate a constituent, indorsed and introduced, apparently without even reading, a bill to improve the alimentary canal. Among bills now pending is one to compel a man to take out a license before buying a drink, just as he has to take out a license to fish and a license to hunt. Another makes it a penal offense for a doctor to perform an operation for appendicitis if it afterward appears that it was not absolutely necessary. Another makes it a penal offense for a man to put his feet on his desk while dictating to a young lady stenographer. Another taxes bachelors between the ages of twenty-five and forty-five. Another compels single men to give up the title of Mister, and wear one equivalent to the title Miss, to prevent single women from flirting with married men, supposing them to be single. There is another to punish with imprisonment profanity over the telephone. Another compels hotels to furnish bed sheets not less than nine feet long. Another punishes railway ticket agents who fail to answer any question put to them by curious travelers. Another is to compel couples desiring to marry to furnish physicians' certificates as to their physical conditions.

Bills have recently found their way into Congress to regulate the washing and ironing of shirts and collars; for the regulation of women's hat pins; making it a penal offense for a man to exhibit a clock in front of his place of business which is either fast or slow. A bill recently forwarded to a prominent Member of Congress authorized its promoter to run a lottery on condition that from the conduct of it he agreed to pay off the national debt.

A natural result of the conflicts arising out of our multitude of laws was brought to light recently in the case of the farmer whose children were chased by a bear on the way to school. The law made it a penal offense to kill the bears, but it also punished the farmer for not sending his children to school, and the school board was obliged to take the matter up and grant him dispensation until the bear shooting season opened and he could kill the animals.

The evil of proposed legislation does not, however, always or chiefly lie in its foolish character. Serious legislation in Congress frequently ignores one of two elementary facts: First that a legal remedy already exists, and, second, that the Federal Government has no jurisdiction over the subject sought to be dealt with. It is frequently said, when such legislation is opposed: "Pass it, anyway, and let the courts declare it unconstitutional if they dare," which only indicates the development of another and dangerous practice creeping into legislation leading by a short cut to chaos and disorder. It also suggests a still more dangerous thought: That of intimidating the courts in the first instance or impeaching them in the second. The proposition now pending in the Arizona Constitution and in some of the States to apply the "re-

call" to the judiciary gives notice that the clamor of the mob and not the spirit of the law shall hereafter be the guide of the judiciary.

Among the ancients, when a man proposed a new law he did it with a rope round his neck, signifying that he was ready to be hanged for it if it failed. If this custom were to prevail today, the lamp posts of our capitals would hardly suffice for members whose measures have been passed under suspension of the rules of sound judgment.

Some thirty thousand bills find their way into each succeeding Congress, and if the nation is "best governed which is least governed" what will be said of ours if Congress yields more and more to the tremendous pressure for the useless multiplication of statutes?

We already have such a mass of legislation, such a multitude of conflicting laws in this country that it is beyond the power of any trained intellect to go further than the narrowest limits of a subject to advise his client what he may and what he may not do. It is serious enough when the laws involve the rights of property, but when they involve one's liberty it becomes little short of deplorable.

As new statutes in many of our States succeed and take the place of the common law, the old landmarks that once guided the legal mind are rapidly disappearing in a mass of conflicting legislation made almost hopeless by the frequently vague and indefinite character of its construction.

All laws are made to be obeyed, and they should never impose a doubt as to their meaning. The most cruel tyrant of history, Caligula, posted his laws so high on the pillars of the temple that the people could not read them and then punished them for their violation; but it is not so very different when the government, in a desire to satisfy public clamor, burdens its statute books with a jumble of words that only result in paralyzing business and puzzling courts.

No task is more difficult, no position more gravely responsible than that of the lawmaker. The people depend upon him to safeguard their rights and liberties, and in return he must have the confidence and co-operation of the people. This tendency to freak and dangerous legislation is but the outcome of unusual conditions thru which we have been developing for the past few years. Much good has come from thoughtful remedies, but the effect of incidental follies will subside as soon as the people realize the futility and danger of pulling down the pillars and crushing the entire congregation because of the misdeeds of a few unrepentant sinners. The American people can always be depended upon, in sober thought, to rise out of error and stand for the highest and best in man. Much of the current clamor for new cures is so out of harmony with the real conditions that it must shortly be recognized and discarded.

We are living in an era in which justice is making mighty strides, in which temperance and tolerance are thriving everywhere. Things that are fair are being guaranteed a longer lease of life with the close of every day that marks American history. Things that are unfair are losing their strength with the setting of each sun. Pessimists and critics there are, but they are not shaping our destiny. The duties before us all are too important to permit of our wasting our time on trifles and our record is too bright to be blotted with a mass of thoughtless, foolish, or dangerous legislation. Care in framing and courage in enforcing laws will do much to reduce the cry for mere volume and allay much of passing clamor.

The record of the American Congress for the past 130 years may not be wholly without errors of judgment, but the fact remains that in its struggles to lighten the burdens and brighten the paths of men it has written upon the parliamentary pages of the world a story more substantial in its blessings, more sublime in its beauty, than all other legislative bodies from the dawn of civilization to the present hour. As new conditions arise and new problems are presented its record justifies the faith that the time will never come when the people will look in vain for legislative measures which the welfare of all may demand.

It should never deny a necessary remedy but its guide must be the light of reason and never the waving red lantern of the alarmist, or the flashlight of the opportunist which blinds every man but the one behind it.

WASHINGTON, D. C.

The Successful Methods of Socialism

BY ALGERNON LEE

[Mr. Lee is one of the leaders of the Socialist party in the United States. He has been the candidate of his party for Mayor of New York City, has been editor of *The Worker* and *The Call* and is now president of the Rand School of Social Science.—EDITOR.]

THE Socialists entered the field of national politics in the United States in the year 1888. They polled 2,068 votes—too few even to excite ridicule. Since then, they have passed thru five Presidential campaigns, and in every one they have increased their poll, reaching a total of 424,000 in 1908. In the State and Congressional elections just held they have made another gain of at least 50 per cent. This is a record of steady progress entirely unique in the history of "third parties" on American soil. But it is exactly in accord with the history of the Socialist party in every other civilized country.

Socialism has been ignored. It has been laughed at. It has been denounced. But it has proved its vitality.

There is one aspect of this movement which has so far received no attention outside its own ranks. Much has been written during the last six years about the theories of Socialism and their application to specific social problems. But the general public knows hardly anything about the internal organization of the party and the methods by which it carries on its work.

The form of organization and methods of action adopted by the Socialists are in close harmony with the peculiar principles and purposes of their movement, and at almost every point they are in sharp contrast with those of the other parties.

When we speak of the Republican or the Democratic party, we have in mind a comparatively small body of leaders and a large number of passive followers. The party organization consists of professional or semi-professional politicians, the majority of them office holders, office seekers, contractors, or saloon keepers, with a few great financiers, industrial magnates, and corporation lawyers in the upper ranks, all held together by mutual dependence for the promotion of personal or business interests. It is this organized body of leaders that writes the platforms, chooses the candidates, and directs the party policy, both before and after election. The rank and file are not asked to take part in the work of party management. They have no thought of doing so. It is not their business—for they agree with the leaders in regarding politics as a business. The average Republican or Democrat resents the suggestion that he should be more active in the direction of his party's affairs. He declares, with some pride, that he is not a politician. His activity is usually limited to voting once a year. If he gives a few minutes on one other day in the year to go to the primary and vote for one or the other of two factional tickets prepared for him by the leaders, he considers himself an exceptionally public-spirited citizen. He takes it for granted that political parties, like other business institutions, must be hierarchically organized and ruled from above. The only control which he conceives it possible for the rank and file to exercise over the "machine" consists in staying at home on election day, or "scratching" the ticket, or, if the conduct of the machine is altogether too outrageous, rebuking it once in a while by voting the ticket offered by the machine of the other large party. It is a purely negative control, and spasmodically exercised.

The financial methods of these parties are consistent with their form of organization. The rank and file are never expected to furnish the campaign funds. If, under exceptional circumstances, when the party machine is deliberately "riding for a fall," they are asked to do so, they open their eyes in astonishment and put their hands in their pockets, not to give, but to make sure that their purses are safe. Why should they contribute to the campaign funds? They are not asking any favors of the party. Let those put up the funds who expect to get something out of it. And those who expect

to get something out of it do put up, often on a very large scale. Office holders who wish to keep their places, office seekers who wish to get nominations or appointments, enterprising gentlemen who wish to get contracts or franchises, and the whole series of "special interests," from railway company and insurance trust down to gambler and dive keeper, who wish to evade the law with impunity—it is these, as every one knows, who provide the sinews of war.

It is quite otherwise with the Socialist party. The Socialists keep in mind the old saying, "Who pays the piper may call the tune," and they see to it that the rank and file collectively pay the piper.

The Socialist party has a definite organization, each member of which pays dues of 25 cents a month. The dues are receipted for and the accounts controlled by the use of gummed dues-stamps, which the national secretary sells to the State secretaries at five cents apiece, the State secretary sells to the local secretaries at double the price, and the local secretary affixes to the member's red card whenever he pays a month's dues. If a member is sick or unemployed, he is excused from paying, the fact being recorded on his card by the local secretary. His card, with the proper stamps affixed, is the certificate of his right and duty to attend party meetings and do his share of party work.

The number who actually paid dues, according to the records of the national office, averaged 41,480 during the year 1909, and the first ten months of the year 1910 show an average of 55,114 paying members. About two-thirds of these are wage-workers, and over three-fifths of the wage-workers in the Socialist party are also members of trade unions. Perhaps one-tenth of the whole number are women, who have equal rights with men in the party organization.

It is not easy to accustom American voters, trained in old-party methods, to this "un-American" scheme of requiring the rank and file to furnish the campaign funds as well as the votes. But the party spares no effort to draw as many as possible of the Socialist voters into the organization. Hardly a street-corner speech but concludes with the invitation to join the party. Special meetings of enrolled voters are called, circulars are sent out, whole districts are canvassed from house to house, to get into touch with the unorganized adherents of the movement and persuade them to become active "comrades" instead of passive followers.

The membership dues, aggregating at present about $33,000 a year for the national organization, as much for the several States, and nearly $100,000 for the locals and branches, form the nucleus of the party's financial system. This income, however, is by no means adequate to the party's needs. It is therefore supplemented by various methods, all of which are characterized by the same care that the whole rank and file of the movement shall share in defraying its cost.

During every campaign, and at other times when special tasks are to be undertaken, the local, State, and national organizations of the party appeal to its members and sympathizers to make voluntary contributions. There are very few rich men in the Socialist ranks, and not many who can be described as even "well to do." The largest single contribution ever made to the party's funds has not exceeded a thousand dollars, and individual donations of even one-tenth that amount are very rare. Many labor unions and other workingmen's societies make appropriations from their treasuries. The contributions of individuals usually range between twenty-five cents and five dollars, but the large number of such mites produces a respectable total. In 1908, when more than $40,000 was raised for the special Presidential campaign fund, it was estimated that not less than 200,000 persons contributed either individually or as members of unions or societies. The Socialist party has not waited for the law to require it to make public accounting of its receipts and expenditures. Column after column in every Socialist paper is taken up with itemized acknowledgements, the giver of a nickel receiving the same recognition as the largest contributor.

In many other ways these funds are swelled to meet the ever growing needs of the movement. Picnics, balls, concerts, lectures, entertainments of all kinds are held for the triple purpose of furnishing amusement or instruction, of bringing the adherents of the movement

into closer social contact, and of realizing a profit to be used in party work. Books and pamphlets are sold at every Socialist meeting. Instead of offering free beer and cigars to draw people to listen to its speakers, as the old parties frequently do in the working-class districts, the Socialist party often charges a small admission fee even at its campaign meetings, and it hardly ever fails to "pass the hat," the chairman reminding the audience that it takes money to pay hall rent and that they, the beneficiaries of the coming Socialist victory, ought to help foot the bills.

The total receipts of the national office during the year 1909 amounted to a little less than $37,000. This year they will probably reach $55,000. The aggregate income of all the State, local, and branch organizations may now be as high as half a million dollars a year, certainly not much more. And it is safe to say that not less than half a million men and women have a right to call the Socialist party their party, on the ground that they help to pay its expenses.

This democratic financial system is the basis for the whole democratic superstructure of the movement. While the party welcomes those who are able to give comparatively large sums, it is never dependent upon them. The large contributor has no reward but the feeling that he has done his duty in proportion to his means. The man who should allow his friends in the party to claim special consideration for him because he has given hundreds of dollars where others have given dimes and quarters would be taking the surest way to discredit himself. In such matters the Socialists may sometimes be said to "stand so straight that they lean backward." They may sometimes carry to an almost fanatical extreme their instinctive distrust of a rich adherent. But, if a fault, it is a fault on virtue's side.

The doctrine that the rank and file must bear the burdens in order that the rank and file may rule does not stop with financial affairs. It is carried into effect also in doing the routine work of the party.

There is a strong decentralizing tendency in the party organization. The national organization is an agency for doing party work, not a governing body. Only to the national convention is the full power of the party ever delegated; and even its decisions, in most important matters, are immediately submitted to a general vote of the membership for approval or rejection.

In general, there is one "local" for each city or town; in a few cases the county is the unit of organization. The larger locals, in turn, are divided into branches covering convenient areas. Each local or branch meets at least once a month; and no one is regarded as a really good party member unless, besides paying his dues, he attends the meetings with fair regularity.

The national secretary and the seven members of the national executive committee are elected annually by direct vote of the whole party membership. In the same way the members of the party in each State elect every year their State secretary, their State committee, and their representatives on the national committee, which is a body of about sixty members, having power to control the executive in all important matters. The delegates to the annual State conventions and the biennial national conventions are likewise elected by direct vote of the membership. Delegates are paid traveling expenses and daily wages for time spent in the party service, so as to make every member actually as well as theoretically eligible to all positions. Out of the 107 delegates in the last national convention, only sixteen were professional persons (including four school teachers), six were business men, seven farmers, four housewives; forty-two were wage or salary workers in private employ; and thirty-two were persons at present employed by the party or by labor unions as secretaries, organizers, speakers or editors, nearly all of them originally mechanics or laborers.

The number of permanent paid functionaries is impressively small. From twenty to thirty persons are usually on the payroll of the national organization, including the national secretary and his office staff and the corps of traveling organizers and lecturers under his direction. All the State organizations together do not employ more than 200 persons in campaign time, and perhaps half that number between campaigns. A few of the larger locals have paid executive offi-

cers and engage speakers at a weekly or monthly salary. The whole number of men and women employed by the party, taking an average thru the year, does not exceed 300. Their wages may average $18 a week, the highest salary, the national secretary's, being $1,500 a year.

The efforts of this little band, however, are supported by the volunteer work of thousands of party members who give evenings and holidays to doing all sorts of work. The portable platform must be carried out for the street meeting and then taken back; leaflets must be distributed from house to house; envelopes must be addressed to carry circulars to voters; committees are needed to see about hiring halls, getting police permits, advertising meetings, visiting unions and arranging all the details of picnics and entertainments. It is hard work, after one has spent from eight to twelve hours in shop or office earning his daily bread. It is tiresome work, bringing neither glory nor excitement. But it has to be done, and it is done. The appreciative outsider would say that a genuinely sacrificial spirit is exhibited in the performance of this unending routine. The Socialist party member to whom such a remark was addressed would shrug his shoulders, smile tolerantly, and answer: "You don't understand. This is fun. We get more out of the party than it gets out of us." The outsider might ask just what it is that the volunteer worker gets out of the party. The reply would be: "The pleasure of doing something that we think worth doing, of doing it without thought of pay, and of doing it in company with comrades." But the outsider would not understand, so long as he remained an outsider.

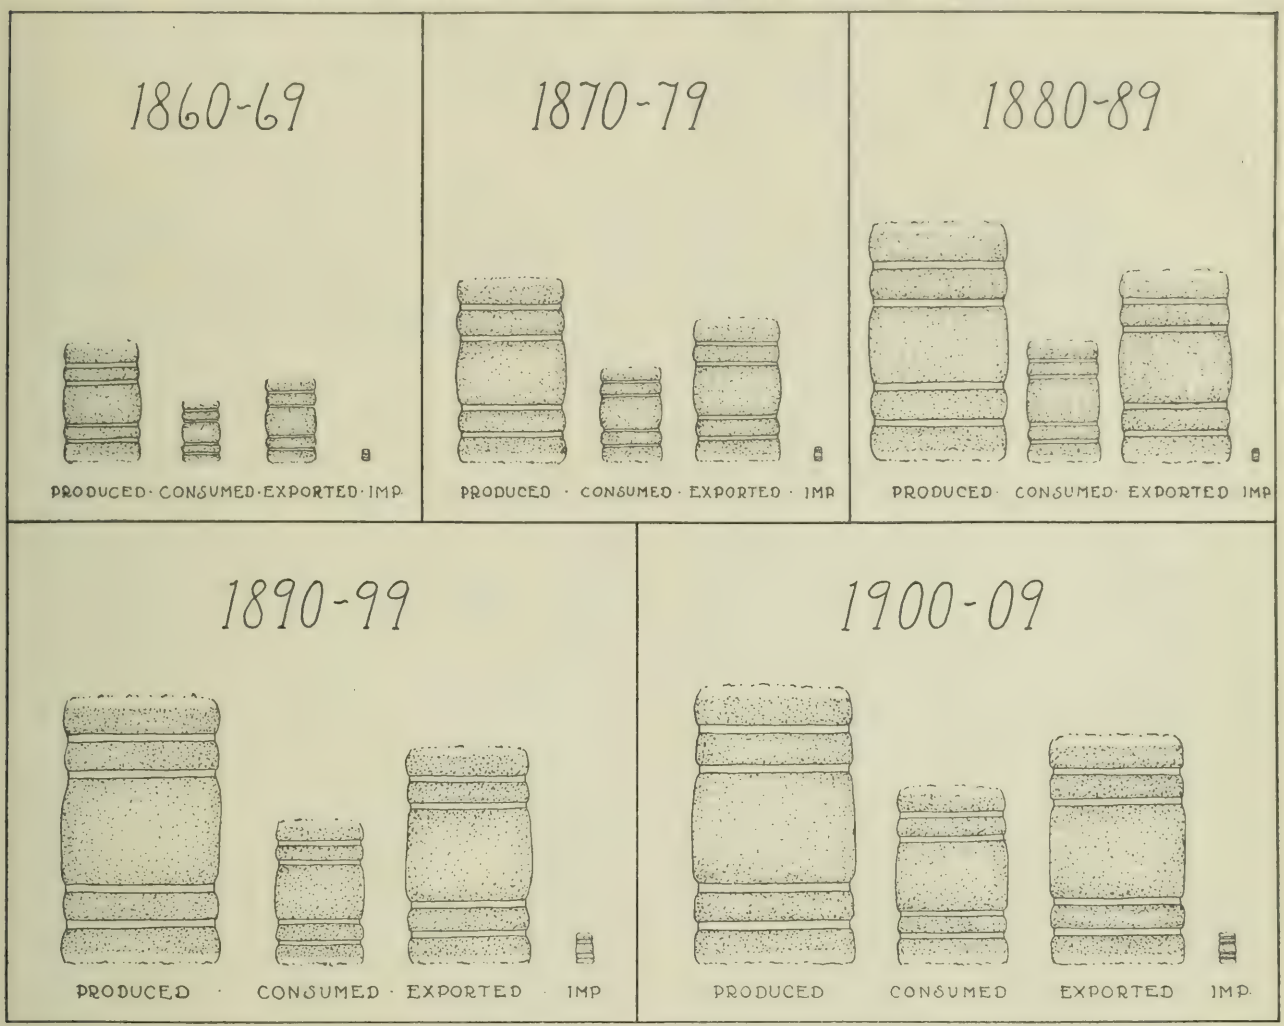
This is the secret of the irrepressible and inexhaustible vitality of the Socialist movement, in the United States as everywhere else. It is democratic thru and thru—in its purposes and its methods, in its ideals and its daily practice. The advancement of the immediate and the ultimate interests of a large and growing class is the aim of its existence. But the class-conscious wageworker holds that the rise and final triumph of his class does not imply the subjugation of any other portion of society—that, on the contrary, the emancipation of the workers from capitalist rule means the emancipation of humanity itself from the rule of hitherto blind and cruel economic forces. Such an aim enlists all the motives of enlightened egoism and of altruistic idealism and blends them into one. The very nature of this aim necessitates democratic organization and methods. The habit of active participation in such a movement gives its adherents a social psychology unknown in other circles. They feel the joy of battle and the joy of fellowship. They cherish exalted sentiments without becoming sentimentalists, without ceasing to use hard common sense. The humblest worker in the ranks feels himself the comrade of its most distinguished leader, and respects himself and his fellows because they are all together conscious of the dignity of the historic mission imposed upon them.

New York City.

The Masquerader

BY ARTHUR W. PEACH

A gray form flitted from the quiet wood;
I wondered what the vagabond could bring;
Then as the gay wind lifted high the hood—
I saw the dimpled, laughing face of Spring!



I knew not what she hid beneath her cloak,
As on she tripped with swift blown kiss to me,
But everywhere the dreaming blossoms woke,
And winds were soft with summer's prophecy.

West Newton, Mass.

Our Cotton Crop

BY WILLIAM B. BAILEY. Ph.D.

Assistant Professor of Political Economy in Yale University.

LIKE wheat, cotton is a commodity of which the importation to this country is almost negligible, but, on the other hand, while the proportion of our wheat crop to be exported has been falling off within recent years, and has always been less than the consumption, the amount of cotton exported has been greater than the amount retained in this country in every decade since 1860. (1) Production; (2) consumption; (3) exportation by millions of 500 bales of cotton per annum have been as follows since 1860:

	(1)	(2)	(3)
1860-69	2.3	.6	.8
1870-79	4.1	1.3	2.9
1880-89	7.3	2.0	4.3
1890-99	8.9	2.9	6.1
1900-09	11.4	4.4	6.9

The importation of cotton never amounted to 100,000 bales in any one year; since 1895 the average yearly importation has been under 150,000 bales.

From about 75,000 bales in 1800, the production of cotton in this country had increased to about 4,500,000 bales in 1861. The effect of the Civil War was disastrous. In 1864 less than 200,000 bales were produced. Not till 1877 did production reach the former level.

In 1863 the price of cotton was over $1 a pound. From this year it gradually decreased in price until, from 1890 to 1903, it was never more than 10 cents a pound. In 1859 Mississippi, Alabama, Louisiana and Georgia were the leading States in the production of cotton, while in 1909 Texas produced more than any other State, followed by Georgia, South Carolina, Mississippi and Alabama. The ravages of the boll weevil have been severe of late, and the production of Texas decreased from 4.6 millions in 1906 to 2.6 millions of bales in 1909. The extension of our cotton production will depend to a considerable extent upon the extermination of this pest.

LITERATURE

Marie-Claire*

On the yellow cover of *Marie-Claire* this title is followed by one single word, *Roman.* If *Marie-Claire* is a novel, however, it is not a novel like the rest. The book is without literary pretensions. Still, short as the time is since it was published, and the world learned the name of its author—a sewing-woman of Paris, who, even in the days before her eyesight began to fail her, earned, on an average, less than 60 cents a day—some 50,000 copies of the French edition have been sold, and an English translation has made its appearance, and Octave Mirbeau and Arnold Bennett have, respectively, written the prefaces of these editions.

The little story is told in perfect simplicity; in short, unornamented sentences. There is no moralizing. No reflections are made upon the actions performed. One may well believe that Marguerite Audoux wrote her book on scraps of paper, on the backs of old envelopes, on wrapping paper, in a little garret-room of the *rive gauche;* made it without preoccupation as to the publisher it might find; the prize it might win; the sales it might attain; the criticisms it might evoke.

Chiefly perhaps because of the severe simplicity of the book, the relevancy of every adjective, the truth of every detail, the total absence of mannerism or mark of "school," it is easy to believe, also, that Marguerite Andoux spent ten years planning and ordering and composing and simplifying her novel. For it is her novel. Impossible to regard the little girl whose mother died and left her to a father who took her to drinking, the little girl who was rescued from her father and placed in an orphanage of the Sisters, the little girl who loved Marie-Adorée (beautiful and unhappy Sister Marie-Adorée), the little girl who became a shepherdess and came to love her flock and her farm and her farmer and her farm-folk, the little girl whose farmer died and whose lover married some one else and who ended by taking the train for Paris—impossible that this little girl is any one other than Marguerite Audoux, dramatized by herself!

The story that the French sewing-woman was ten years writing has been translated into English in ten days—more or less. Ten days, from a publisher's standpoint, is a conservative time allowance in the case of a nine days' wonder. It is the fable of the bird in the hand. Doubtless the publisher is an excellent logician—as publishers go. Yet we would not give the impression that *Marie-Claire* is an unapproachable masterpiece: a landmark in fiction, like "Vanity Fair" or Balzac's first successful novel. We even entertain a healthy skepticism as to the likelihood of Mademoiselle Audoux's "repeating" her success. Certainly it will be a marvel if she again writes a novel so unspoiled, so essentially a product of herself. No, *Marie-Claire* does not, in all probability, mark the dawn of a new day, nor yet of a new method. Only, it is as much more unaffected than George Sand's "Petite Fadette" or "La Mare au Diable" as those two fictions are more natural than the *bergeries* of the seventeenth century novelists. It is not a conventionalized novel—that is its distinction; not conventionalized, nor even, as we find it, prettified: in spite of the sentiment. Nothing is left out because it makes the book less idyllic; nothing put in because it might bolster up a thesis or drive in a tendency. We are grateful for *Marie-Claire:* narration of

*Marie-Claire. *Par Marguerite Audoux.* Paris: Fasquelle. 3 fr. 50. Imported by Brentano. (75 cents.)
Marie Claire. *By Marguerite Audoux.* New York: G. H. Doran Co. $1.20.

a child who gazed long upon a mother lying silent before lighted candles, and who wore, next day, a new dress with black and white checks. It hightens the old antithesis of "naturalistic" and "natural." And that is as it should be, for are not Audoux and Zola at opposite ends of the alphabet?

One reads *Marie-Claire* with much the feeling one has in reading old family letters—written for one reader, not for the world. Of the three parts into which it is divided, the second, descriptive of her farm life, is by far the most charming.

Missionary Literature

THE missionary conference held in Edinburgh last summer marks an era in missionary progress. Its organizers used it as a means of bringing together the most valuable knowledge and wisdom accumulated in missionary effort and experience during the last hundred years, and so planned the preceding campaign and the meetings themselves that the conference has given to the missionary enterprise the greatest impulse it has received in all Christian history. As an outcome of this new interest and zeal influencing all communions and schools of thought, an enlarged and more varied literature is already springing up, imbued with the new vision and echoing the call to action sounded at Edinburgh.

First among the books which should attract our attention is the historical and interpretative account of the conference itself, written by Mr. W. H. T. Gairdner.[1] The author is a missionary from Cairo, well informed in both home and field problems, and brings to his task of authorized chronicler and interpreter unusual ability in selecting the significant features of the meetings and reports and in giving them a readable and interesting form in his account. The suggestion and plans leading up to the conference, the appointment and work of the various committees, the character of the Edinburgh sessions, with the reports and speeches made, are all discussed in a most attractive and informing way. This book forms a proper introduction to the remarkable reports of the eight commissions which were appointed as early as 1908 to investigate as fully as possible various phases of the missionary movement and to prepare suitable memorials for consideration by the conference. These reports, together with the records and addresses of the conference, are now published in nine inexpensive volumes,[2] and constitute the most extended, thoro and valuable exposition and discussion of missions ever made. A mere recital of the names of the commissioners, chosen as they were from all quarters of the globe, would guarantee the high character of the work done. We find on the list of officers of the commissions not only such religious leaders as John R. Mott, Bishop Gore and Julius Richter, but also such well-known publicists as Lord Balfour of Burleigh, the Hon. Seth Low and Sir A. H. L. Fraser. Every one of these reports represents extensive inquiry and the study of a great mass of correspondence from missionaries and others the world over. All are filled with well-digested and well-arranged information pertinent to the topics considered. If one were to single out any of the volumes for special praise, he would doubtless turn first to that on "Education in Relation to the Christianization of National Life," but his conscience would not be satisfied if he did not mention the stirring report on "Carrying the Gospel to All the Non-Christian World," and the thorogoing discussion of the "Home Base," to which the commission fortunately added an extended list of missionary literature in many tongues.

As a direct result of the Edinburgh Conference, inspired by its meetings and written mainly as commentaries on the reports already mentioned, we have two books which will prove of peculiar

[1] ECHOES FROM EDINBURGH. *By W. H. T. Gairdner.* New York: F. H. Revell Co. $1.

[2] REPORTS OF THE WORLD MISSIONARY CONFERENCE. Vol. I, Carrying the Gospel to all the Non-Christian World. Vol. II, The Church in the Mission Field. Vol. III, Education in Relation to the Christianization of National Life. Vol. IV, The Missionary Message in Relation to Non-Christian Religions. Vol. V, The Training of Teachers. Vol. VI, The Home Base of Missions. Vol. VII, Missions and Governments. Vol. VIII, Co-operation and the Promotion of Unity. Vol. IX, This History and Records of the Conference. New York: F. H. Revell Company. Each volume, 75 cents; the set of nine, $5.

worth in helping those who were not present to grasp the meaning and message of that assemblage and to enter into the spirit of the new era it has started. Mr. Mott,[3] who was one of the conference leaders and its chairman, dwells on several of its features with his usual facility in marshaling facts and figures and his impressive style of presentation, while the Rev. Norman Maclean[4] has put the atmosphere and essence of the movement as he understands it into a book delightful to read because it is written in direct, limpid English, and pervaded by a positive conviction united with sweet reasonableness that gives charm and winsomeness to the writer's appeal.

For the justification of missions in the light of modern thought and other world movements, and a consideration of their background in Christian life and history, one may find plenty of material in the books by Professor Carver,[5] Mr. Lilley[6] and Dr. Mabie,[7] and if he is not weary with much reading, he may gather together the broad outlines of the whole subject, as seen in its changed aspects and emphases by a veteran missionary and student, in *The Modern Missionary Challenge*,[8] by Dr. John P. Jones, of India.

It must be said that while none of these books excel individually some of the valuable works which have recently preceded them, nevertheless, as a whole, the missionary literature now represents more worthily than heretofore the movement as it exists today in its purposes, aims, methods, resources and *raison d'être*. In the truest sense of the word, the missionary enterprise has become a *world* movement in its outlook, its practical working and in its spiritual background.

[5] MISSIONS AND MODERN THOUGHT. *By William Owen Carver, M.A., Th.D.* New York: The Macmillan Company. $1.50.

[6] THE VICTORY OF THE GOSPEL. *By J. P. Lilley, M.A., D.D.* Philadelphia: United Press. $1.50.

[7] THE TASK WORTH WHILE, OR THE DIVINE PHILOSOPHY OF MISSIONS. Seminary Lectures. *By H. C. Mabie, D.D.* Philadelphia: The Griffith & Rowland Press. $1.25.

[8] THE MODERN MISSIONARY CHALLENGE, A STUDY OF THE PRESENT DAY WORLD MISSIONARY ENTERPRISE, ITS PROBLEMS AND RESULTS. *By John P. Jones, D.D.* New York: The Fleming H. Revell Company. $1.50.

The American Year Book. A Record of Events and Progress, 1910. Edited by S. N. D. North. New York: D. Appleton & Co. $3.50.

We have often commented upon the comparative lack of annuals in this country and the consequent difficulty that the general reader finds when he wants authentic information on recent events and the progress of the various sciences. This new work is particularly adapted for this latter purpose because of its topical arrangement, each department being in charge of a representative of the national society devoted to that subject. If one wants to know what is being done in Mendelism, socialism, agriculture, radioactivity, simplified spelling or missions, he can find it clearly and succinctly stated. *The American Year Book* has only one rival in its field, the "International Year Book," and the two are fortunately quite different. The "International costs $5, contains about a third more matter, it is alphabetically arranged and illustrated by maps and pictures. We do not care much for the pictures, but the maps are a useful feature. The *American* is the prompter, appearing in January, but this is not so much of an advantage as it appears. Since it must be prepared for the press before the year closes, its record of the year is not complete and therefore one is apt to be misled in using it for reference. It would really be more nearly up to date if its publication were delayed a few weeks to include the annual reports and summaries which appear early in January.

The Sword Maker. By Robert Barr. New York: Frederick A. Stokes Company. $1.25.

A lively tale of the Rhine country between Frankfort and Cologne, *The Sword Maker* is one of the pleasantest historical romances we have read. It is the story of the robber barons who used to come down from their eagle-nests in the rocks and take cruel toll from the passing barges of the merchants of Frankfort, Cologne and Mayence. Prince Roland, the sword maker, with twenty swashbuckling companions, guildmen all, attempts to open the Rhine to unmolested commerce, and the tale of their bold adventure is an exciting one.

We suggest the crowning of Mr. Barr by the Nobel Peace Prize award, as he has demonstrated that a book may be intensely interesting without dripping with gore. To carry a hero and his men thru a hazardous and thrilling campaign without a fatality is an achievement unusual as it is fine. It is a war of wits between the contestants, with the fearful joy of skillful fencing rather than the stupidity of actual wounds. Of course, the possibility of war between the armies of the three Electors is always present; a potential battle is the black background against which this adventure of the engaging and high-hearted Prince Roland is outlined, but it is a gallant comedy, with personalities rather than swords as the protagonists, and we enjoy it as a lover of chess enjoys watching a well-matched game. The haughty attitude of the medieval guilds of handcraftsmen is well brought out, their pride and independence are likely to cost the young Prince dear more than once as he leads them against the robber barons of the Rhine, who had carried their depredations so far that "the Rhine was without a boat and Frankfort without a buyer." There is a pretty love story whose heroine is a high-spirited but easily adorable Countess von Sayn, and it is a rare satisfaction to meet such a radiant young couple, to find a hero and heroine for whom the reader need make no excuses.

Literary Notes

....*Motion Study,* by F. P. Gilbreth (Van Nostrand), is a contribution to the new science of economy of movement, applied particularly to brick-laying, but containing general principles and suggestions applicable to all kinds of manual operations.

....The essay by Prof. A. S. Cook on *The Authorized Version of the Bible and Its Influence,* which appeared in a shortened form in Vol. IV of the Cambridge History of English Literature, is now published in full by G. P Putnam's Sons ($1). It is a fine discussion and appreciation of this great classic.

....Among the spring publications of L. C. Page & Co. are: *Old Country Inns of England,* by H. P. Maskell and E. W. Gregory; *Argentina and Her People of Today,* by Nevin O. Winter; *Abroad with the Fletchers,* by Jane Felton Sampson; *The Story Girl,* by L. M. Montgomery, and *A Captain of Raleigh's,* by G. E. Theodore Roberts.

....Henry N. Ogden, C. E., is the author of a textbook *Rural Hygiene,* newly issued by The Macmillan Company ($1.50). As might be inferred from the initials following the author's name, the work deals rather with the structural side of public hygiene than with the medical.

....John R. Rathom is the author of *Two Chicago Sketches,* privately published: "When the City Wakes to Life" is a newspaper man's vivid impression of morning, from milk wagon time on; "Lake Michigan in Calm and Storm" is a description of just what it professes to describe.

....Eugene A. Hecker, master in the Roxbury Latin School, is the author of *A Short History of Women's Rights,* from the days of Augustus to the present time. (Putnam's; $1.50.) Of the 287 pages, more than half record progress made in the United States and in Great Britain.

....*Step by Step,* a story of the early days of Mendelssohn, told by Abram S. Isaacs, is a commendable piece of work, issued by the Jewish Publication Society of America (Philadelphia; 75 cents). The romance is put into the general form of fiction, and should interest young people, especially those of the Jewish race.

....The Louis Lange Publishing Company of St. Louis has issued a neatly bound *Luther-Album* containing reproductions of some twenty-five paintings by W. Weimar, illustrating significant crises in the life of Martin Luther. The accompanying text presents a popular and readable biography of the great reformer.

....It is to be hoped that every office boy will not take to writing verse as a result of Messrs. E. P. Dutton & Co. publishing a *Compact Rhyming Dictionary,* bound to look like a prayer book, for the low price of 50 cents. The dictionary is the work of P. R. Bennett, and words are classified according to the number of syllables as well as by rhymes.

....*The Gift of the Grass,* by John Trotwood Moore (Little, Brown; $1.50), is a tale of the track. The book is, if you care to call it so, a trotter's autobiography, and a particular trotter's, Hal Pointer's (2:04½). Mr. Moore has no fear of the pathetic fallacy, yet his tale as a whole is not pathetic; and we recommend it to any one not above looking upon the horse race when it is run.

....As successive volumes of Harper's new compact edition of Thomas Hardy's novels make their appearance, we grow to like the series better and better. *Two on a Tower,* printed on whitest of paper, makes a brave appearance. There is a frontispiece, and also a most useful map, showing the Wessex of the novels. In the same series, and at the same price ($1.25) is published *The Woodlanders.*

....Houghton Mifflin Company have in preparation a two volume edition of the *Letters and Journals of Charles Eliot Norton*, a biographical record edited by his daughter, Miss Sara Norton, and M. A. DeWolfe Howe. Professor Norton's long and rich life and his close friendships with the foremost men of letters of his century in both England and America are assurances that the book will possess uncommon interest.

....The story of *The Quaker Boy* (Cochrane Publishing Company; $1.50) as chronicled by Robert Barclay Dillingham, has a many-sided interest. In it are found descriptions of the quaint ways of life once prevalent among the Friends in New York, reminiscences of college days and boyish pranks, love episodes, and experiences during the civil war, culminating in an account of the battle of Gettysburg. All is told with a fitting sense of the humor and pathos of life.

....We are none of us so familiar with the newer Asiatic railroad routes that E. G. Kemp's large volume, *The Face of Manchuria, Korea and Russian Turkestan* (Duffield) should fail to be welcome even tho, as its title confesses, it is but superficial. It consists largely, like most tourists' impressions when they are sincere, of reminiscences of food and sleeping accommodations. The twenty-four plates doubtless give one an idea of the colorations of Oriental scenes, but they are not very attractive as pictures. The map is especially valuable, as it shows the territory now under dispute by Russia and China.

....Readers of *le Figaro* know that she who signs herself "Fœmina" is no Ruth Ashmore of French journalism, but a serious-minded person who travels not thru space alone, ranging also wide fields of speculation. Her articles are now gathered up in a volume entitled *L'Ame des Anglais*, with the subtitle "Impertinent Hypotheses" (Paris: Bernard Grasset. 3 fr. 50). If fog is the outward phenomenon, she deduces therefrom a whole philosophy. One feels less secure in the fog, born mentally and physically; above all, one's muscular discipline must be perfect. Ergo, the Englishman is a "musculaire." The American reader is inclined to believe that Fœmina makes too much of English self-control and exaggerates the Spartan quality of the English ideal; but these are as much questions of the audience adressed as they are of fact, when all is said and done. "Every Englishman is an island; interposed between him and outsiders, his intimate originality encloses him like an ocean." This aphorism reminds us of the fact that it is not long since that other "feminist" who signs herself Pierre de Coulevain gave to her book on the same Englishman and English woman the title, "L' Ile Inconnue."

Pebbles

"Do you have any trouble in getting a maid?"

"Oh, no! I got ten last month."—*Philadelphia Bulletin.*

"It is hard," says Col. Henry Watterson, "to lose the savings of a lifetime."

We know people who have done it without half trying.—*Chicago Record-Herald.*

An Irishman was looking at the headless statue Victory, when he suddenly exclaimed: "If you call that victory, what would defeat look like?"—*New York American.*

He—Tomorrow, darling, is our wedding day.

She—Yes, and it's bargain day at Silkman's, too. Isn't it just too aggravating!—*Boston Transcript.*

"Why do you weep over the sorrows of people in whom you have no interest when you go to the theater?" asked the man.

"I don't know," replied the woman. "Why do you cheer wildly when a man with whom you are not acquainted slides to second base?" —*Washington Star.*

The following story is told by a priest as illustrating the French Canadian respect for professional authority: Among my friend's parishioners is an old couple. The old man is over eighty and a little annoying to his old wife. Recently he fell sick and became unconscious. The doctor was called in and pronounced him dead. The old woman folded her hands in silent prayer. The old man began to come to consciousness. He heard the doctor's dictum. He did not believe in it. Exerting all his strength as he mentally beheld the coffin closing down upon him he quavered: "I am not dead; I am not dead." The old woman was dreadfully shocked. She shook her apron in the old man's face. "Hush! Hush!" she bade him; "the doctor says you are dead, and he knows better than you. You are dead! You *are* dead!"

LAKE SHORE MUSICAL CRITICISM.

"The Flonzaley Quartet gave a delightful concert of chamber music in the Auditorium last evening. It was a brilliant audience, representative of Chicago society, and the costumes and jewels of the women were beautiful.

"Mrs. J. Sheridan Rhode was in box No. 60, wearing a black satin heavily jetted with a collar of pearls.

"Mrs. Forest Lake, wearing silver gray satin embellished with silver spangled net, a collar and pendants of diamonds, was in box No. 57.

"Mrs. O. Gingerbread Blackstone, wearing gold tissue finished at the corsage with gold filet lace, was with Mrs. Lord O. Lord in box No. 59. Mrs. Lord wore a green chiffon and satin."—*Chicago Tribune.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Senator Lorimer

We are sorry for the United States Senate; we are sorry for the State of Illinois; and yet the Senate and the State have brought on themselves the disgrace which we regret. Are these Senators who voted to allow Mr. Lorimer to retain his seat because to them bribery seems an inconsiderable and venial offense necessary and usual in politics? That would explain some votes. We would not say so, but Senator Root, as wise and good a Senator as there is, said in the Senate that it is the popular belief that seats in the Senate have been obtained by bribery, and "it is this belief," said he, "that has been sapping the confidence of the people of the country in the Senate of the United States." Senator Root did not deny that this belief is true. He left it to be understood that he would sustain the popular belief. We add that it is this belief that gives force to the movement for the election of Senators by the people instead of by the legislatures.

The evidence of bribery in the election of Mr. Lorimer was overwhelming, and it was confest; and the manager of the campaign was Lorimer, and the beneficiary was Lorimer; and if he is a blind fool as to what is going on, he has not that reputation.

By a vote of 46 to 40 the Senate sustained him, and because the Senate sustained him we are sorry, but we give it no pity for the disgrace it has suffered in public esteem. We are sorry for Senator Lorimer, but we do not pity him. He will remain in a sad plight, with nearly half the members voting that he is an unfit associate, and enough others who voted for him believing he is guilty. In the next Congress it will be worse for him. He is a marked, branded man. Who would care to be his companion?

Yet he had defenders. They said that there was not absolute legal proof that he knew of the bribery and approved it. But there are presumptions that ought to have satisfied even these his supporters. They voted for him, but they knew better.

The *Inter Ocean*, of Chicago, has been his champion, but it champions him in the way that a petty lawyer defends a client he knows to be guilty, by abusing the opposing counsel. The policy of it is not clear, but the best that could be done was to abuse all who were supposed to be responsible for the exposure of the bribery. So it ridicules the President, who, since the "vindication" of Lorimer "looks as if some one had swatted him with a brassie out of his own bag, and had finished him off with a niblick."

Roosevelt is "the pirate of Oyster Bay." Senator Bailey's [sic!] "hide is stretched on yon neighboring fence." And so it goes over the list of the Senators: Owen, "scorched to a cinder"; "ditto Crawford, ditto Brown, ditto Jones"; Beveridge, "hypocritical filibuster"; Borah's reputation, "in need of repairs"; Cummins and La Follette, "filibustering hypocrites," and Senator Root, "shivers in his bare bones, and casts piteous eyes toward the White House." And this is journalism! And this is politics!

We do not expect Mr. Lorimer to resign. Why should he? He holds his boughten honor, and he can keep it thru the six-year term. He can stand it, as he could stand bribery, but can the great State of Illinois endure it? Does Illinois now wish she had the recall? Has

she no recourse? Oh! if she had the true sense of self-respect and shame, she would elect such a Legislature as would, without law of recall, bid him slink from his political seat and make room for one who might redeem her blighted honor.

The Method of Social Reform

HUMAN society has never been constructed or reconstructed according to plans and specifications. Social theories —political, legal and economic—have influenced the making of those social plans and specifications which are known as constitutions and statutes, but society itself is a living and growing thing, and wayward withal. It breaks thru constitutional limitations, twists them and distorts them, and makes endless trouble for the strict construction legalists.

Not only so, but society in the very act of having its own way—that is, when devising and putting into effect the ways and means of social self-control—gives little heed to the logical requirements of theory. It tries experiments, and the history of social experimentation may well seem to the logical mind like the annals of a lunatic asylum. Actually, they are not like lunacy in the least. There is a consistency, a correlation, even a unity in them all, which is not obscure to the mind that has been trained to appreciate phenomena of evolution, especially those within the range of biology and psychology. This amounts to saying again, in other words, that the ways of society are the ways of those natural objects that live and grow, and not at all the ways of ratiocination.

In all ages, and thruout all the known stages of the historical evolution of the human race, society has been making and remaking itself by a process that may well enough be called "feeling its way." It has sometimes hesitatingly, sometimes impetuously inhibited old relations and ancient ways of doing things, and has tried new rules and devices. In this experimentation society has nearly always been entirely opportunistic. It has not asked whether the new attempt could be justified from Plato or Aristotle, from Jean Jacques Rousseau or Karl Marx. It has only asked whether the experiment would probably work out satisfactorily under actual conditions of time and place, of conflicting human interests and the obstinacies of human nature. Society, in a word, is thoroly pragmatic, whatever happens to philosophy.

Not only in this broad sense has society a method in the apparent madness of its experimentation, it has a method also in the narrower sense of a working rule governing its choice among countless opportunities for experimental activity. It never attacks those ancient and fundamental features of social structure which are like the great organic systems in the morphology of plant and beast. It addresses itself to what it calls "crying evils," "intolerable conditions," "survivals of savagery and barbarism," and the like, very much as the individual man's reformatory assaults upon his personal anatomy are directed upon his molars and his vermiform appendix, or, to take a rather better illustration from the psychological aspect of life, very much as a man of sturdy character directs his reformatory efforts against his more embarrassing kinds of ignorance and those sins which have a way of getting him into trouble.

Concretely, then, the method of social reform which society actually follows is this: It persistently attempts to stamp out, cut off, or otherwise destroy, those conditions, those forms of conduct, and those customs and institutions which have become most troublesome, either because they diminish well-being, or because they awaken an irritating sense of something disgraceful or emotionally disturbing. In a word, it attacks marginal misery, marginal wastefulness, marginal cruelty, indecency and dishonor.

For example, long before society was concerned about the natural right of every man to vote and hold office, and long before such problems as those of old age pensions and the collective ownership of the means of production had interested the social philosophers, human society had made some progress in curtailing murder and theft, in restraining the power of tyrants, and in relieving the acute distress of the destitute. By experiments in these directions it had, to some extent, raised the

general level of conduct and well-being. In like manner, civilized society today is attacking specific problems of wretchedness, unwholesomeness and injustice. We are no longer satisfied to prohibit crime. We are somewhat blindly, but nevertheless persistently, trying to discover how to prevent it. We no longer think it enough to give alms to beggars; we are talking about the possibility of preventing overcrowding in tenement houses, of stamping out tuberculosis. Governments establish old age pensions. They are prohibiting child labor, and interfering with the reckless sacrifice of life in the dangerous occupations. When these reforms have been accomplished, society will probably take up seriously the question whether poverty itself can be abolished, whether the more important means of production can be owned by the many and employed for the general well-being, and whether a more just distribution of wealth can be attained.

That this is the normal, in the sense that it is the historical, the practical, the actual method of social reform, no one we imagine, will deny. It is especially worthy of serious attention at the present time, because the theoretical reconstructionists, who have most strenuously objected to it, the Marxian Socialists, for example, are beginning to admit that it is the only possible method. With the exception of a little clique of "Impossibleists" in the United States, the Socialists of the civilized world are rapidly becoming evolutionists, and are addressing themselves to the realization of their program of "immediate demands." By this move they are becoming a new and efficient political force. Practical social reform has already been carried much farther in England and on the continent than in America. It is time for the United States to begin to catch up with the procession.

The Democratic Blunder in New York

While the Democratic convention which nominated Mr. Dix for Governor of the State of New York was in session, a prominent independent democratic paper of New York City (which afterward supported the ticket) asserted that it was completely under the control of Charles F. Murphy, the leader, or boss, of Tammany Hall. Mr. Dix was a resident of the northern part of the State, and many, even of those who were convinced that his nomination had been ordered by Murphy, expected that in office he would be his own master. After the election, Murphy's influence was shown in the organization of the Legislature and the Senatorial nomination. A caucus named William F. Sheehan to succeed Senator Depew, but the election of Sheehan has been prevented by a bolting minority. To the testimony of one independent Democratic paper as to the power exerted by the Tammany boss in the convention at Rochester, there was added, last week, that of another, the *World*, concerning his influence in the Legislature at Albany:

"Murphy alone was the caucus majority. Murphy is the Legislature. He controls its organization. No bill can be reported out of a committee over Murphy's veto. Murphy is the State. This is the condition to which free government has sunk in New York. This is the condition which John A. Dix as Governor of the State and nominal leader of his party meekly tolerates."

The nomination of Mr. Sheehan was unexpected. It has frequently been said that if that nomination could have been foreseen, the people would not have elected a Democratic Legislature. The logical candidate of the victorious party was Edward M. Shepard, whom the bolting minority have supported. His nomination and election would have given the State a Senator of exceptional ability and would have aided his party thruout the country in 1912. It may be noted that the election of Mr. Shepard was desired by Judge Gaynor, the successful Tammany candidate for the office of Mayor of New York, who said last week:

"I favored him for United States Senator because of the very great admiration which I have long had of his qualities as a man and as a statesman of the first order. In the Senate he would from the first day have been conspicuous even among the ablest men of that body."

Mayor Gaynor's disagreement with the Tammany leader about a candidate for the Senate suggests disagreement about other questions. Impairment of municipal control and diminution of municipal profits have driven Tammany

to seek State control and the patronage and profits which are associated with power at Albany.

The long contest over the Senatorship has caused much bitterness in the party. Mr. Shepard, last week, in a notable letter, formally withdrew his candidacy, which for some time had been hopeless. Murphy, he said, had opposed him—

"—the reason seemingly given being the extent to which I was favored by that independent sentiment without which in November our party would have suffered serious defeat, and without which it can win no future victory. . . . More than once, after having been put in power by the indispensable support of independent Democrats, the deliberate act of the 'organization' has stripped itself of that support for the very next election and thus condemned itself to years of repeated defeats quite as calamitous as they were unnecessary."

Caucuses, he said, in which the genuine view of the constituencies was brought out, were good things, but the caucus which nominated Sheehan had not been such a caucus. Many of those present did not represent their constituencies, or even represent their own opinions:

"Under the discipline of Tammany Hall their votes had been put into a trust and were to be cast by one voting trustee. Such a trust was a perversion absolutely destructive of party health, and, if carried far enough, even of the very life of the party itself. . . . The Democracy of New York State can never succeed in a campaign where it is believed that the leader of Tammany Hall has controlled its nominations, will control the Legislature if it be Democratic, and will be the overshadowing power even in the Executive Chamber. . . . The health and life of the Democratic party requires that, so long as there shall continue the one-man voting trust of Tammany Hall and the influences which are behind it, there shall be the power and the right of any sufficient and respectable minority to decline to be bound by any caucus controlled by that trust. In no other way can any exalted or honest purposes of the Democratic party of this State be accomplished."

On the same day Congressman Martin W. Littleton, who has announced his candidacy for the Senate, addressed a sharp letter to Mr. Murphy, in the course of which he said:

"Do you think that you would strengthen your organization, improve the Democratic prospects, and act in obedience to the purpose and meaning of the Constitution if you withdrew this influence of your individual judgment and openly released every Assemblyman and Senator from any obligation which he may feel to you from any sense of party loyalty, and left them free to exercise their own choice? Do you not feel that the Democratic party in the country generally demands that you withdraw your influence from the Legislature? Do you think that a compulsory caucus, registering your own judgment alone as to the fitness of the candidate, can in any sense be said to be a caucus of the majority of the Democratic party?"

In reply to Mr. Shepard's letter of withdrawal, Mr. Murphy published a long statement, in which he asserted that Mr. Shepard had been glad to accept the Tammany "voting trust's" nomination for Mayor in 1901, and that his friends had asked for its support a few weeks ago. The statement closed as follows:

"No literary skill no finished compliments to himself, no self-issued certificates of devotion to Democratic principles, no sophistry of any kind can conceal from the plain Democrats of the State the fact that in this fight Mr. Shepard is fighting with the minority to overthrow the rule of the majority and to defeat the party's nominee for some reason so un-American and un-Democratic that he does not dare even to avow it."

Then Mr. Sheehan, in a letter of 3,000 words addressed to the Democratic legislators, offered to abide by the decision of a new caucus, and incidentally attacked Mr. Shepard. Expressing his "admiration" for the latter "as a man, a lawyer and a scholar," he remarked that his admired opponent had personally solicited the aid of one McCooey, the head of a "voting trust" in Brooklyn. He also said:

"It is true that the political records of many of his supporters who are old enough to have such records demonstrate that all their lives they have been in favor of minority rule, except when the majority rule was exercised in their behalf; and when not so exercised, the rule of the minority with them becomes a patriotic and paramount principle."

We have quoted these passages from the voluminous correspondence in the case to show how great a disturbance in the party has been caused by this quarrel about the Senatorship. It is due to the efforts of an organization whose connection with the national party has usually been harmful rather than beneficial. The interests of Tammany are local and its aims are mercenary. There was an inviting opportunity for the Democrats in the greatest of our States to promote the success of their party in next year's campaign. It has been thrown away. Even if a properly qualified man should

now be elected—which seems scarcely possible—what has been lost could not be regained. Everybody has had a chance to see the skeleton in the New York Democratic closet.

The Session of Congress

THE quality of the Sixty-first Congress is fairly indicated when we say that at the beginning of its term it enacted the Payne-Aldrich tariff bill, and in its closing days, after voting to keep Lorimer in the seat from which he should have been ousted, refused to approve the Canadian reciprocity agreement, From first to last it was controlled by a blind and blundering majority, for a great part of the time unable to see the drift of enlightened public opinion or to understand what kind of legislation was demanded in the interest of justice and reform. Broad generalizations are not always absolutely fair, and we should say that the record of the House has been better than that of the Senate and that the action taken has not been wholly bad. For example, we do not overlook a considerable quantity of good work in the first regular session. But with respect to many measures and subjects of great importance and public interest, the record of the controlling majority has been one of failure, notably in the session which ended on Saturday last. By the Payne-Aldrich tariff this majority, breaking its party's promise to the people, caused a political revolution, displacing a Republican majority of 47 in the House by a Democratic majority of 66, and reducing the Republican majority in the Senate from 28 to 10. In the recent and final session even those so-called insurgents or progressives, whose course in the first session had received and deserved so much commendation, exerted their influence on the wrong side and aided the reactionaries in promoting the election of a Democratic President in 1912.

The President's agreement for reciprocity with Canada should have been approved in the Senate, as it had been in the House. Action upon the bill for a tariff commission should have been taken in the Senate early enough to prevent defeat in the House by filibustering in the closing hours. We see no good reason for the killing, in the Senate, of the House bill for a reapportionment. Arizona's constitution was disapproved, as it ought to have been, but that of New Mexico did not deserve to share its fate. The two propositions should have been considered separately. There should have been a vote, at least, in the House on the ship subsidy bill. There was urgent need of new land laws, framed in accord with the President's recommendations. This need was suggested by the Ballinger investigation. But the old laws remain. At one time it was expected that provision for the beginnings of a parcels post would be made, but the bill was thrown out a short time before adjournment. The bill relating to Appalachian and White Mountain reserves must be counted on the credit side, with the Japanese treaty, the honors paid to Peary, two or three measures of some importance in the field of Treasury finance, the suppression of the pension bill by a point of order, and the reform of the judicial code. The question whether there ought to be an increase of the postage rates on magazines is to be the subject of inquiry by a commission, but the provision for a commission would have been lost if the President by much exertion had not saved it at the last moment. In the seating of Lorimer, and also in the conduct and attitude of many Senators, there is evidence that the quality of the Senate would be improved by direct popular elections, but the bill to provide such elections was defeated by the shrewd manipulation of those who disliked it. It should be taken up again promptly in the special session. Eventually it will be enacted.

The House can point with some satisfaction to its recent course. It passed the Canadian reciprocity bill and the tariff commission bill by large majorities, but the credit for this action cannot be claimed by the Republican party. It is noticeable that the filibustering movement by which action on the conference report concerning the latter bill was prevented was led by the New York Democrat who was at the head of the small minority of Democrats who stood with Speaker Cannon when he was in imminent danger, at the first regular session.

Who are responsible for the calling of an extra session? Mainly the Repub-

lican insurgents of the Senate, Mr. Beveridge excepted. There would have been no extra session if the Canadian reciprocity agreement had been approved. The leader of the insurgents in their war against the agreement was Mr. Cummins, honorably prominent in 1909 among those who sought to improve the Payne-Aldrich tariff bill. In past years he has professed to regard reciprocity with much favor, writing paragraphs in Iowa platforms supporting it as "the natural complement of protection," and pointing out in public addresses how advantageous it must be to both of two nations directly affected by it. He knew, of course, that the effect of the amendments which he proposed would be to prevent action in the Senate, or, if they should be adopted, to kill the agreement. Moreover, if the United States should make the proposed concessions on manufactures, receiving no similar concessions in return—for Canada would not grant them—it would be necessary, under existing treaties, to give the same reductions to Germany, Great Britain, France and other countries. If the reductions could be confined to Canadian products, our farmers, whose champion he would be, could gain little or nothing, because Canada has few manufactured goods to sell. If the products in question should be reciprocally free-listed, our manufacturers would gain and those of Canada would be driven out of business. It is very difficult to account for Mr. Cummins's attitude upon any theory in which his sincerity is granted. He and his insurgent associates ought to have supported the agreement, even if it was made by a President whom they dislike. Their conduct with respect to this question has been extremely disappointing to many who found in their keen criticism of the tariff bill evidence of statesmanship and an intelligent regard for the public interest.

We assume that in the extra session the reciprocity bill will be passed promptly by the House. On February 14, all but five of the present Democratic members voted for it. In the new House, the Democrats will have a majority of 66. In the Senate the insurgents may hold the balance of power. Even if they continue to oppose the bill, it will be passed if a vote upon it, as a separate proposition, can be reached. But it is difficult to predict what the legislative plan will be. The reciprocity bill may come from the House to the Senate, attached to provisions for a radical revision of the tariff, and these may be objectionable to more than half of the Senators. We suspect that the Democrats, having in mind the Presidential campaign of next year, and desiring to shape the issues in that campaign to the advantage of their party, will try to avoid giving credit to the Republican President by passing his reciprocity bill unless at the same time they shall be permitted to reduce rates in important schedules of the tariff law. Their program is not completed. Revision projects undoubtedly will be a part of it, and it is reasonable to expect that they will so associate these projects with the reciprocity bill as to gain for their party the greatest possible political advantage. There is much uncertainty as to what they will set out to do and as to what they can accomplish. If the session shall prove to be an irritating and futile one, and shall impose restraint upon business, the people will remember who caused it to be called, and will place the blame where it belongs.

Americans Abroad

OUR educational representatives at the court of Berlin are again in conflict, this time over invitations to a dance. It seems that Prof. Hugo Münsterberg, of Harvard, and Prof. C. Alphonso Smith, of Virginia, were not content with their competition upon the lecture platform but wished to carry their contest to the ballroom floor. This was natural because their first set-to, which took place on November 10, was virtually a drawn game. The markers on each side kept tally of the number of hand-claps and smiles of the Kaiser and Kaiserin during the two inaugural addresses, but Professor Smith scored a real laugh from the imperial mouth in the first round and it was a question whether it was fair to count that. Professor Münsterberg is naturally funnier than Professor Smith, but Professor Smith had borrowed the winning joke from Mark

Twain. He said that war was unthinkable between two nations that loved Huckleberry Finn. Of course the Kaiser had to laugh at such a remark. Anybody would even if he knew less about war than the Kaiser.

After the lectures Professor Smith scored again on totality of duration of conversation, fifteen to one according to the cabled reports. But a statement published by Professor Münsterberg rather altered the case. He wrote to the papers:

"If there was anything marked in the contrast, it was that he naturally treated Mr Smith with the formality with which a newcomer is welcomed and met with the cordiality with which he had talked to me on previous occasions and which made the conversation turn at once to intimate subjects."

Without inquiring into how Professor Münsterberg knew what the Kaiser and Professor Smith talked about, for he was, as he tells us, conversing with the Kaiserin at the time, we accept his statement as correct or as nearly correct as the testimony of any eye and ear witness and active participant under such circumstances could be expected to be. The honors were therefore even.

The ballroom contest was more serious and came near involving the rulers of both nations in a controversy and so endangering the validity of Professor Smith's thesis about Mark Twain as a preventive of war. The main points of the affair may be concisely stated as follows:

Professor Münsterberg met Professor Smith in the Palast Hotel and said that he (Professor Smith) would be invited to the Schleppencour and balls, but that he (Professor Münsterberg) would not because he (Professor Münsterberg) was not an American but a German (which seems a queer reason for not being invited to a German ball, but no matter). So Professor Smith went to the American Ambassador, Dr. Hill, to see if he could get him an invitation, and he said he would, and Mrs. Hill wrote Mrs. Smith that she would take her to call on Countess Brockdorff, but she telephoned later that she couldn't, and Dr. H. (we must save space by using initials) told the Baron von dem Knesenbeck that he must make an exception in favor of the Smiths and the Baron v. d. K. said he would; and then Prof. M. and Mrs. M. called on Mrs. H. and demanded that the Smiths be not presented, and just then Dr. H. came in and Prof. M. said he would cable to Pres. T. if he didn't, and Dr. H. said he would, and when Prof. S. heard of it he said he would appeal to Emp. W. and he called on Privy Councillor Schmidt (possible family influence here?) and wrote to Cultus Minister von Trott zu Solz and Cultus Minister v. T. z. S. called on Count Eulenberg and—but really we must stop here. It takes up two columns in the New York *Times* and we do not see how it can be put in less space without losing some of the sense.

Professor Münsterberg replies to all this in another column, denying that he was "a snake in the grass." On the contrary, he had asked him to dinner and "enjoyed his after-dinner stories." Professor Münsterberg says that all he said to Mrs. Hill about Mrs. Smith's dress in that Sunday afternoon conversation was that he did not see that the possession of a new gown was sufficient reason for appealing from a court decision. Mrs. M. also had a new dress that she could not use. Etc., etc.

This must not be dismissed as a trifling affair. The Schleppencour is as important as Junior Hop and every educated person knows that the question of Junior Hop invitations is enough to keep the students awake nights and the professors awake during faculty meeting.

Besides, the honor of two great universities is involved. Professor Münsterberg wears the crimson of Harvard upon his court dress, and Professor Smith the blue and white of Columbia upon his. These two institutions are neck and neck in the race for the Kaiser's favor. Harvard first got the Germanic Museum, but the exchange professors from Germany cannot sleep in the old gymnasium among the plaster casts of the Kaiser's ancestors, and they complain of the Cambridge boarding houses. So Columbia countered by proposing to establish a Deutsches Haus, where its exchange professor can enjoy all his home comforts. But Mr. Adolphus Busch, of St. Louis, is to provide the funds for a bigger Germanic building and if he stocks it as well, the

attraction of Harvard will be irresistible.

Columbia did not have to rely wholly upon its Roosevelt professor, C. Alphonso Smith, this year. President Butler himself went to Germany, and Prof. Rudolf Tombo, Jr., of Columbia, boldly challenged Professor Münsterberg in debate over what constitutes the American university.

We have never seen either Professor Smith or Professor Münsterberg dance, so we cannot say which would best represent the United States at the Kaiser's court. Perhaps it would be better to send over a dancing master next year as exchange professor if he is expected to take the floor rather than to occupy the chair.

This affair will probably revive the question as to Dr. Hill's fitness for his post. It looks as tho he had muddled. At the time of his appointment it was predicted that he would fail because he had spent his life in the study of books of law instead of books of etiquet. When will the American people learn that only men of wealth, family and style are eligible for diplomatic positions?

It is not for us to decide whether Hugo or C. Alphonso is the truer exponent of modern Americanism. Both seem equally to realize the importance of questions of rank and precedence. Both seem equally free from that contempt of kings and courts which was characteristic of the old-fashioned American.

Senator Bourne's Attack

Early last week Senator Bourne, of Oregon, not long ago a particular golfing friend of the President, indulged in a bitter attack upon him charging him with using his patronage to control legislation. We do not doubt that patronage has been used and withheld at times to control or prevent legislation, what Senator Bourne calls bribery or intimidation. Yet that is not quite fair. The President has an immense—luckily a lessening—amount of patronage to give, and as he does not know the applicants in all the States he has to get advice of Senators and Congressmen, and the President naturally and properly seeks advice from Republicans if he is a Republican, or from Democrats if he is a Democrat. That pleases them, and they like to please him. If that is bribery it is a sort not easily avoidable. They do not think of it as bribery when they use their power of advice to the President to get the help of his appointees for their own re-election. Equally if Republican Senators are quarreling over the control in their own State and giving the President contradictory advice, he will naturally follow the advice of the one who is supporting his policies. It is not human nature to do otherwise, not to speak of prudence. Senator Bourne was pleased enough so long as the President appointed his nominees, and he did not consider himself bribed; but now, that the President has made appointments on the advice of his rival Senator, he is angry and sees intimidation. He quotes against the President that most unfortunate letter written by his secretary, Mr. Norton, announcing that hereafter the President would give patronage to the Insurgents as well as to the standpatters. It is a letter than never ought to have been written, which gives color to Senator Bourne's present charge that the President had used his power of appointment to give aid and comfort to certain Senators and to endamage others. Doubtless his choices did have that effect, but how could he help that? He had to please some and displease others. We will assume that he used his power in the way that seemed wise. He could use it in a way that would be as bad as bribery or intimidation, but it is not so necessarily, nor ever in the case of Senators who are above being bribed. Senator Bourne's speech does not strike us as courteous or just in the application he intended against the President.

Old Masters and New

Nowadays "old masters" are almost as popular a subject of newspaper stories as are real scandals. Indeed, the payment of $200,000 for a Gainesborough or $500,000 for a Rembrandt is scandalous in itself. Quite apart from the irony of it all, in an age when more Rodolphes are starving than ever starved before, there is something disturbingly extravagant about such valuations—they are as extravagant as one of Crassus's dinner

cards. Furthermore, these hundreds of thousands of dollars are often spent on what are far from being the best examples of their authors. And when they are not printing details of "treasures" saved or lost to the British nation, or some other nation, the newspapers tell us of the American millionaires or 'airesses who are duped by picture forgers. Now, the tendency to encourage dead painters at the expense of live ones would be praiseworthy enough were it cultivated thru the collector's love of beauty, pure and undefiled. As a matter of fact, since most American collectors cannot tell the difference between a real old master and a d'Aulby de Gatigny one, one cannot help wishing success to the picture forger. May Trouillebert find many a worthy successor! And likewise Escarousa! And the gentlemen who do the forging for the Fifth Avenue shops—power to their elbows! In time they may perhaps teach the collector to go out for something better than a name. And, art appreciation apart, there is a lesson of sincerity to be learned at whatever cost.

For a Conference of Christendom

The proposal adopted at the last session of the Episcopal General Convention for the calling of a World's Conference of all Christian Churches to discuss matters of faith and order, with a view to a more harmonious understanding between them, has made some progress the past week. An informal conference of official representatives of four leading demonstrations was called last week at the residence of Dr. Manning, chairman of the Episcopal Commission and rector of Trinity Church in this city. The meeting of such a World's Conference was approved, and the Episcopal Commission was asked to call a larger informal meeting of representatives of evangelical denominations with a view to taking formal and final action for such a conference. Every effort for union should be helped, and yet we fear that advances will not be met favorably by the largest body of Christendom which has lately from the Vatican denied the orders of the Anglican Church, and which has forbidden its members again to take part in such a meeting as was the Inter-Church Congress at Chicago.

For Social Purity

The report of the grand jury appointed in this city to investigate the white slave traffic, with John D. Rockefeller, Jr., as foreman, asked that there be appointed by the Governor or the Mayor, a commission for the investigation of the social evil, with a view to its control. No such commission has been appointed, and the task is left in the hands of the Committee of Fourteen, of which Dr. John P. Peters was chairman until lately, and Mr. H. F. Whitin is now chairman. That committee has been doing very effective work, particularly in reducing the number of so-called "Raines law hotels." Such a hotel has been nothing less than a saloon which serves also as a house of assignation. When the committee was organized in 1905 there were about 1,200 such "Raines law hotels"; the number is now 87. Most have been suppressed, and 200 have become "hotels for men only." It is interesting to observe that the brewers' association has given much help, refusing to serve places reported to them as disorderly. It will be remembered that of late the brewers have been much concerned over the success of the local option movement and have discovered that the best way to retain their trade is to suppress disorderly places. The bonding companies have also been brought to give their aid by refusing to bond saloons of ill repute. This is all fine work, but there is vastly more to be done, for the whole social evil needs to be controlled, outside of its fringes in the saloons and Raines law hotels. There is no greater evil among us, and it is time that it was taken up seriously, for both morals and health, for the protection of marriage and the home; for it is the foe of honorable marriage and the destruction of the home.

Senator Bailey

Senator Bailey is not a man to be loved, exactly, by his enemies. He is too passionate, too bitter. We recall how, after the fight of his election to the Senate, he made a speech at which he swore enmity as long as he lived to those

who had opposed him, and bade his sons carry on the vengeance to the next generation. It was in sudden passion that he sent last Saturday his resignation to the Governor of Texas, but withdrew it on the urgent protest of Democratic fellow Senators. But in this case his passionate action was to the credit of his political sincerity. He does not believe in certain advanced measures incorporated in the Arizona Constitution; and when it seemed that the majority of the Democratic Senators approved them he was so indignant that he was unwilling to remain politically associated with them. No doubt he is one of their ablest leaders. Eleven of them signed a protest to the people of Texas against the acceptance of his resignation, in which they called him their "undisputed and most conspicuous leader," and a twelfth, Senator Tillman, in a separate protest, characterized him as "the ablest man in the Senate, without exception, and one of the best equipped men in public life." He will remain, but he needs to learn to control his temper and bridle his tongue. We observe that a dozen Democratic Senators did not contribute to these bouquets; and they were men like Senator Owen, of Oklahoma, who had voted for Arizona.

Higher Education for China

We have received from the Imperial University of Peking a letter calling our attention to the fact that the article by President Thwing on that university, in our issue of September 15, was written by him on the basis of his personal observations three years ago; while events are moving very rapidly in the New China, and immense improvements have been made since then, such as the readers of that article would not have suspected. Three years is now a whole cycle in Cathay. From a communication by Prof. Luther Anderson we quote the following extract:

"Since the writer of the article in question was in Peking, the Imperial University has received enormous grants of money from the Chinese Government, has opened many new departments, and has established more advanced courses of instruction. Three years ago the Preparatory Department only was in operation. This department, which the writer describes as the Imperial University, corresponds roughly to an American high school plus two years of college work. It is something like the upper classes of a German gymnasium, and is called the Preparatory Department because it prepares the students for the University Department. In the latter, which did not exist when he was here, all the work is advanced and specialized and can therefore with justice be classed as university work. The departments which have already been opened are, Law, Commerce, Political Science and History, Natural Sciences, Civil Engineering, Mining and Metallurgy, and Agriculture. In these departments all those branches are studied which would be studied in the corresponding graduate departments of any good American or European university. Other departments will be opened in the near future.

"Large modern buildings are now being erected with all possible speed just outside the city wall. However, it can be said to the credit of the Imperial University that more attention has been paid to securing good teachers than to erecting buildings. It is one of the very few universities in the Orient that have a faculty, that is, a body of teachers who are all highly trained specialists in their respective subjects. Most of the foreign teachers hold the highest academic honors and have had previous experience in college or university teaching. Among the members of the faculty there are men who have taught in the Universities of Berlin, London, Geneva, Chicago, and other institutions of the same rank."

Professor Anderson adds:

"The Provincial University of Tientsin has excellent departments of Law and Engineering, where a university grade of work is being done. The Imperial College of Finance in Peking is doing highly specialized work of a university grade. The same is true of the Imperial College of Law in Peking, the Imperial College of Medicine in Tientsin, and the Imperial College of Languages in Peking. The latter prepares men for the diplomatic service."

Two months ago we called attention to the announcement by the Rev. G. Margoliouth, an able scholar belonging to the British Museum, that a recent old Hebrew "Zadokite Document" lately discovered and published by Dr. Schechter was the product of a very early Jewish-Christian sect, that honored John the Baptist and Jesus, but was bitterly opposed to Paul. We have since made a careful examination of this Document, and are convinced that it is not Christian, but represents a Jewish sect and was written between 60 and 70 B. C. We regret this conclusion, for if Mr. Margoliouth were right it would be a work of the first importance in Christian history.

Insurance

Workmen's Compensation

Compensation for workmen injured in the course of their daily labor is a subject which has steadily grown in interest, until now it has become a legislative problem of huge dimensions in every State, and particularly in those largely engaged in manufacturing. The principles hitherto governing the relations of master and servant are steadily undergoing changes of a radical character, with the probability that ultimately the defense comprised under the heading negligence of employee and fellow servants will ultimately disappear completely from our jurisprudence. The conviction is deepening that the money value of injuries suffered by workmen are properly a charge against the cost of production, payable by the consumer or user of the article produced.

Much of the legislation already enacted is comparatively crude and will undoubtedly prove upon actual trial to be inadequate or impracticable. But the problem is engaging some of the best minds in the country—labor leaders, millionaires, manufacturers, philanthropists, jurists and sociologists. There is little disagreement between them respecting the accuracy of the leading principle here referred to—that the negligence of the injured worker should not be an insuperable bar to the recovery of compensation to some extent. But taken as a whole, the varying provisions and methods suggested or already enacted in some of the States constitute a jumble that closely resembles chaos. These laws will, when perfected, carry the fundamental American defect—lack of uniformity. The need for a comprehensive system of laws governing this subject are fairly illustrated by the case of one Andrew J. Ridge, an employee of the Oolitic Stone Company of Indiana. According to the record, Ridge, while at work for the company in 1901, was injured more or less seriously by a falling ledge of stone. He did not make a diligent effort to secure an amicable settlement of his claim for damages against his employers, and it is probable that the latter were negligent and indifferent in their attitude toward their employee. Ridge employed lawyers to bring suit and the case was tried four times, the first jury disagreeing, the subsequent three awarding damages to the plaintiff. Appeals were taken from each of the judgments rendered, and the higher court reversed the first two. Upon considering the last appeal the highest court in the State evinced a disposition to end the litigation and sustained the last verdict of the court below. The award amounted to $7,635.65. But in his zeal to prosecute the case vigorously, Ridge had enlarged his legal staff as the years wore on, and found, at the conclusion of the fight, that he owed for counsel fees and incidental expenses the sum of $7,585.90, leaving for himself as compensation for injuries sustained and the fruits of ten years' litigation the beggarly amount of $49.75.

Senseless as is this final result, a careful consideration of the circumstances as they seem to have occurred render any other impossible. It is difficult to assume that the element of passion was not present on both sides, and quite as difficult to imagine that had both litigants approached the matter in a friendly spirit a settlement satisfactory to each could not have been made. As it turned out, both of them are heavy losers, while their joint substance has gone into the pockets of lawyers and court attachés. From the fact that three juries awarded damages to the plaintiff, we may reasonably conclude that he had a fairly good case under the old law covering that subject, and that he was undoubtedly entitled to some amount of compensation. It is for the purpose of correcting evils of this character that a reformation of the laws in this direction should be made.

FINANCIAL

Railroads and Business

After the sharp decline of prices on the 24th ult., following the announcement of the freight rate decision, there was, up to the end of last week, no general and well defined downward movement on the Stock Exchange. On the 1st inst., unfavorable reports of railroad earnings began to appear. These had little or no effect on that day, but on the 2d, with much larger transactions, there was a decline of about 2½ points in the active list. This was ascribed partly to the earnings reported and partly to the menace of an extra session of Congress. In the remaining days of the week there was but little change, and losses for the entire week were small, ranging from ¾ for Steel, Reading and Union Pacific (the three leaders, in whose securities a little more than half of all the business was done) to 1⅝ for New York Central, 1¾ for Great Northern, and 3½ for Northern Pacific.

On the 1st, the Western railroads decided that they would not appeal from the decision. They argued that confirmation of it by the Court of Commerce would tie up the rates for two years, while, if they should accept the Commission's judgment, they might, by and by, propose some rate advances and be allowed to enforce them. At the meeting of the officers of the Eastern roads there was no complete agreement, and another conference is to be held. Some thought there should be an appeal, or that the validity of the law should be tested; others were of the opinion that the decision should be accepted. The Commission may be asked to reopen the case, as to certain roads and several of the proposed advances. There has been no general movement for reduction of railroad expenditures. The St. Paul road has laid off one-fourth of the men engaged in construction, and the Lake Shore has reduced the number employed in its shops. Public attention has been directed to no other changes of this kind. Some remarks given to the press by Judge Gary, chairman of the Steel Corporation, were distinctly reassuring. He said:

"It is my opinion that if the rate decision has a depressing effect upon business conditions it will be temporary. From my information it seems to me general business conditions are generally and materially improving. If this continues, as now seems probable, it necessarily follows that the business of the railroads will correspondingly increase, and in order to take care of their interests they must put and keep their tracks in good condition and largely increase their equipment. The different lines of business of the country are more or less tied together. It is time for all of us to take things as we find them, and make the best of them. In such a country as this, where productive capacity is so great and increasing so rapidly, we shall find great opportunities for success."

* * *

....The annual statement of the Central Leather Company, of which Edward C. Hoyt is president, shows assets of $136,461,642 and surplus of $3,806,206. The capital stock is $33,299,050 preferred and $39,701,031 common. The profits for the year after deducting all losses and expenses were $3,403,680, which, with income from investments of $144,210, makes the total net profits for the year $3,547,890. The sum of $4,384,318 has been paid in interest on bonds and debentures and in dividends on the preferred stock. These figures show the progress the company has made, notwithstanding the continuous depression of the leather business. Mr. Hoyt's report to the stockholders is published in full on another page.

....The Nassau Bank, which was established in 1852 and is a charter member of the New York Clearing House, has received the consent of the Comptroller of the Currency at Washington to change its name to the National Nassau Bank. There is no change in the officers or directors and Edward Earl is president.

....Robert C. Lewis, who has recently been made president of the Guardian Trust Company, was formerly the vice-president. He was born and educated in New York and was graduated from Princeton University. The new vice-president is Edward F. Clark. Lathrop C. Haynes is vice-president and secretary. The capital is $500,000, the surplus and undivided profits are over $537,000, and the total resources nearly $4,700,000.

The Independent

VOL. LXX NEW YORK, THURSDAY, MARCH 16, 1911 No. 3250

Survey of the World

Troops Massed on the Mexican Border

Orders were given, on the 7th, for an extraordinary movement of soldiers of the United States army to points near the Mexican boundary. These orders called for the assembling, without delay, at points on the border, of 20,000 troops, nearly all of whom were to go into camp at San Antonio, Galveston, or in the vicinity of Los Angeles. At the same time 2,000 marines were sent to Guantanamo; four armored cruisers, carrying 3,800 officers and men, were directed to sail for that port; measures were taken for the transportation of thirty-six companies of coast artillery from North Atlantic ports to Galveston, and the greater part of the Pacific fleet started for San Pedro or San Diego. Soldiers were drawn from many points, some of these as far away as Minnesota, Utah and Wyoming. It was officially declared by the President, Secretary Dickinson and General Wood that the purpose of this movement (the most extensive of its kind ever executed in the United States in time of peace) was merely that maneuvers should be practiced at the camping points, and that the power to mobilize quickly should be tested. In an official statement given to the press on the 7th it was said that the object was to "train officers and men in the field," to "hold maneuvers involving possible operations against Galveston by the navy," to defend San Diego and San Pedro against similar attack, and to "test the preparedness of the staff departments for mobilization." This explanation was not accepted without question by the public. It was said that our Ambassador to Mexico, Mr. Wilson, who had recently come to Washington, had submitted a gloomy report about the situation south of the boundary. There were rumors that President Diaz was near death. It was also reported that complaint had been made to our Government directly by those representing an investment of about $1,000,000,000 of American capital in Mexico, and indirectly (thru Great Britain, Germany and France) by representatives of the investments of citizens of those countries. Mining and railroad companies had suffered much loss by reason of the insurrection, and had not been protected. It was said that the maintenance of the Monroe Doctrine was involved. The general belief was that our Government sought to assist the Diaz Government by the moral support of so large a force near at hand; to insure enforcement of the neutrality laws, and to be ready to take proper action if the death of Diaz should cause great disorder. Our Government continued to insist, however, that the only purpose of the movement was the one already announced. But a more satisfactory explanation was given, on the 9th, in a semi-official statement published by the Associated Press correspondent accompanying Mr. Taft on his vacation journey southward. His dispatch began as follows:

"All doubt as to the purpose of the Government in sending 20,000 troops to the Mexican border has been swept away. The United States has determined that the revolution in the republic to the south must end. The American troops have been sent to form a solid military wall along the Rio Grande to stop filibustering and to see that there is no further smuggling of arms and men across the international boundary. It is believed that with this source of contraband supplies cut off, the insurrectionary movement which has disturbed conditions generally for nearly a

year without accomplishing anything like the formation of a responsible independent Government will speedily come to a close."

It was also said in this dispatch that the movement would be a valuable lesson in quick mobilization of an effective fighting force and would answer certain critics of the army. There was no longer any reason to doubt that the sudden action had been due "either to unofficial representations of foreign Governments regarding the situation in Mexico, or to an intimation that such representations would soon be made." Our Government had been led to believe that it must act quickly if the Monroe Doctrine was to be maintained. It also

ernment "would be a source of constant worry."——Señor Limantour, Mexico's Minister of Finance, arrived in New York from Europe on the day when orders for the movement were published. He attended many conferences relating to the situation, and was repeatedly interviewed. His exprest opinion, like that of other Mexicans here and in Mexico, was in substance that our Government's course was a legitimate and friendly one. When it became known, however, that small American cruisers had been ordered, on each coast, to patrol duty, he was inclined to object. With Mexico's Ambassador, he protested against any reference to possible intervention or in-

THE BORDER. THIS MAP SHOWS THE MORE IMPORTANT PLACES FIGURING IN THE WEEK'S NEWS.

The railways are indicated by dotted lines. From El Paso to its mouth, the Rio Grande marks the boundary between the United States and Mexico.

desired to be "in a position to invade Mexico at a moment's notice if the death of President Diaz or any other untoward circumstance should precipitate general fighting or rioting." It was considered "probable" that Mexico had indicated to European Powers its inability to put an end to the insurrection so long as succor should be given in the United States to the revolutionists. The troops would remain until the end of the insurrection. Our Government had been deeply concerned in the movement affecting Lower California, because the establishment there of a separate and independent government "would be a source of constant worry."——Señor Limantour, Mexico's Minister of Finance, arrived in New York from Europe on the day when orders for the movement were published. He attended many conferences relating to the situation, and was repeatedly interviewed. His exprest opinion, like that of other Mexicans here and in Mexico, was in substance that our Government's course was a legitimate and friendly one. When it became known, however, that small American cruisers had been ordered, on each coast, to patrol duty, he was inclined to object. With Mexico's Ambassador, he protested against any reference to possible intervention or invasion for any purpose. That, they said, would not be tolerated and would mean war. Friendly messages were interchanged between President Taft and the Mexican Government, which was assured of our good will. Foreign Governments denied that complaints had been addressed by them to our Government. Mexico said she had received none. It is known, however, that Mexico had repeatedly complained to Washington about conditions on the boundary. Mexico's consul at New York remarked that half of the revolutionists were American citizens, and all their guns and

ammunition and the greater part of their food had been supplied from this country. Both Mexico and Japan denied that Japan had obtained or even sought coaling station concessions or privileges on the Mexican coast. When Señor Limantour was reminded that revolutionists had praised him, and it was suggested that the problem might be solved if he should become President, he said this was absurd, adding that Diaz had repeatedly asked him to accept the Presidency, and that he had always refused.—— Foreign comment has been fair, as a rule, except in certain anti-American papers of Germany. It is generally assumed that our Government has had the Monroe Doctrine in mind, and that it may be trusted to protect foreign interests if Mexico shall fail to do so.

Course of the Insurrection

President Diaz on the 11th asked the permanent Commission of Congress for authority to set aside for six months certain constitutional guarantees, so far as they relate to such offences as brigandage, raids upon villages or farms, and interference with railway or telegraph service. The desired authority will be granted, and then the Government will be empowered to put to death summarily, or practically without trial, those guilty of such crimes. In effect, nearly all of the revolutionists will be exposed to such punishment.—— Madero, with 600 revolutionists, on the 6th attacked Casas Grandes, 225 miles south of El Paso and Juarez. After twelve hours' fighting they were driven away, with a loss of 200 men. All (except one) of the members of a company of Americans were either killed or captured. Among those killed were a brother of Madero, De Lara (who collaborated with John K. Turner in writing magazine articles on "Barbarous Mexico"), and a grandson of Garibaldi. ——At Douglas, Ariz., 150 men, nearly all of them Mexicans, were captured by American troops, on the 9th, as they were about to cross the boundary and join other revolutionists in an attack upon the neighboring town of Agua Prieta.

Secretary Ballinger Resigns

Richard A. Ballinger's resignation as Secretary of the Interior, dated January 19, was accepted by the President March 7. Walter Lowrie Fisher succeeds him, taking charge March 12. Mr. Ballinger based his resignation upon the state of his health, and continued to hold office until after the adjournment of Congress only at the President's request. Mr. Taft, in accepting the resignation, does not hesitate to say that Mr. Ballinger has

"been the object of one of the most unscrupulous conspiracies for the defamation of character that history can show."

The new Secretary is a resident of Chicago, the third such in the present Cabinet. He is a friend of Gifford Pinchot, the deposed Chief Forester, and brings an excellent equipment to bear upon the coal lands question, which is by no means solved. The law board of the General Land Office is divided as to whether the testimony shows that the persons who filed on the Cunningham claims were guilty of attempted frauds on the Government. In view of this difference of opinion among his legal advisers, Fred Dennett, Commissioner of the General Land Office, is undecided as to what recommendation he will make. The facts will be laid before the new Secretary. It is possible that President Taft will in the end be obliged to frame a decision in this case. An effort was made at the recent session of Congress to pass a bill referring the case to the District Court of Appeals of the District of Columbia. Secretary Ballinger recommended that such action be taken, but opponents of Mr. Ballinger fought the bill, insisting that as the Secretary of the Interior was empowered under the law finally to judge all land cases, there was no good reason why an exception should be made here. The Administration approved the bill, but it failed of passage. Apart from the Cunningham case, there are a number of others in court. The general inquiry into conditions regnant in Alaska, which was one result of the Pinchot-Ballinger controversy, resulted in the taking of evidence against various alleged coal land thieves, and indictments have been handed down at Seattle, Spokane and Detroit. Details

of an alleged conspiracy to seize thousands of acres of Alaska coal lands have been laid before a Chicago grand jury. The investigation is to be directed against prominent citizens of Chicago and other cities. Fraudulent locations were made thru the employment of "dummy" entrymen. Magnates of the Alaska Northern Railroad are said to be implicated. The so-called Chicago conspiracy was directed against coal lands in the Mananuska District of Alaska.

The Lorimer Case: Conclusion

Mr. Lorimer, on his triumphal return to Chicago, after "vindication," declared that "the hand of a "Divine Providence" had preserved to him his seat in the United States Senate. His friends turned out en masse to greet him at the railway station, and paraded in automobiles thru the Chicago streets, headed by three brass bands. The Illinois press and pulpit did not join in this welcome. In Elgin, a mass meeting protested against the Senate's vote in the case. At Rockford, a large mass meeting unanimously adopted resolutions calling upon both Illinois Senators to resign, and like resolutions were voted at Lake Forest and at Lincoln. A subpoena has been issued by the State's Attorney of Sangammon County, Ill., for the appearance of Senator Bailey, of Texas, and the production of the slip made out for Daniel W. Holtslaw, former State Senator, when he deposited $2,500 of alleged bribe money in the State National Bank of Chicago. This slip disappeared in the course of the debate in the United States Senate, but was last seen in Senator Bailey's hands.

The Cost of a Congress

Statements issued by ex-Representatives Tawney, of Minnesota, and Livingston, of Georgia, chairman and ranking Democrat of the Appropriations Committee of the late Congress, show appropriations at the last session to have aggregated $1,025,489,662. Mr. Tawney adds that this is less than $1,000,000 in excess of President Taft's estimates. He praises the Executive for good faith in scrutinizing estimates, and computes that the surplus of revenues next year, which, with any part of the Treasury cash balance, can be applied to the sinking fund, will be not less than $26,542,000. The former chairman of appropriations renews his recommendation for the consolidation of the appropriating jurisdiction of the House under a single committee representative of all sections, and of all branches of the public service. Eight committees now consider the estimates and report appropriation bills. Mr. Tawney points out that the aggregate for the session is $2,500,000 less than the aggregate for the preceding session of Congress, and that the aggregate of the entire last Congress is an increase of $600,000 over the preceding Congress. Mr. Livingston, on the other hand, contends that militarism is a menace, and that Democratic accession will prevent national bankruptcy. He says that it is a labor of Hercules to restore expenditures to a normal level, because of the enormous liability fastened upon the treasury

> "by the statutory increase of the enlisted strength of the army and the navy fourfold since Mr. Roosevelt was so unhappily called to the executive office of the republic."

It is reported that former Speaker Cannon will not be a candidate for the minority leadership of the new Congress. James R. Mann, of Illinois, is regarded as the candidate of the Republican organization. This candidacy is likely to meet with bitter opposition from the Republican insurgents.

Canadian Reciprocity and Boundaries

President Taft does not expect the Sixty-second Congress to take up important legislation at its special session other than the agreement upon reciprocity with Congress. His friends say that he is prepared to veto a general tariff revision undertaken without sufficient data, or a ratification saddled with riders providing for the revision of specific sections. He wants Congress to defer all this till the Tariff Board has reported. The Government majority at Ottawa is still efficient. Members of the Opposition say the de-

bate in the Dominion Parliament will last for weeks. It is now debating upon a resolution. When that is passed, a bill embodying its terms must go thru three readings, and be discussed item by item. ——The members of the International Commission to define and regulate the boundary waters between the United States and Canada will be, for the United States, James A. Tawney, of Minnesota, chairman; ex-Senator Thomas A. Carter, of Montana, and Frank S. Streeter, of New Hampshire.

From the States

Senatorial deadlocks continue in Iowa and New York. Governor Dix's letter to the Democratic members of the New York Legislature has had no apparent effect. Mr. Dix and Mayor Gaynor have held frequent conferences on the situation. The latter, who declared for Mr. Shepard when he was a candidate for the Senatorship, has more recently suggested Herman Ridder, publisher of a New York German newspaper and a prominent Roman Catholic. No one expects that Mr. Ridder will prove the successful candidate, but his support by Mayor Gaynor, like the support of Mr. Kernan and others by various of the Albany insurgents, is a sufficient answer to the insinuation by Mr. Sheehan's friends that he is opposed on narrow grounds of churchmanship and nationality.——Charles E. Merriam, Republican nominee for Mayor of Chicago, chartered a special train one day last week to go to Springfield, Ill., and appear before the legislative committee in charge of a bill providing for an initiative and referendum amendment to the State Constitution. Thanks to his action, this measure will go before the State Legislature at this session.——The Pennsylvania House of Representatives has voted against placing the Boyd local option bill on their calendar, 121 to 76. A measure providing for local option has been a part of the reformers' program in Pennsylvania at several sessions of the Legislature.——Of the $790,000 inheritance tax paid to Utah by the Harriman estate, $750,000 will be appropriated by the Legislature for a new State Capitol.——Thirty men were buried under tons of earth as the result of an explosion at the Norman mine, on the Mesaba Range, near Duluth, March 11. Twenty-five are believed to have lost their lives. ——Storms thruout Central and Northern California have caused washouts, floods and damage to crops. Forty families at Watsonville, lost their homes, and San José also was badly flooded.——The explosion of the Laflin-Rand Powder Mills, at Pleasant Prairie, Wis., 50 miles north of Chicago, was felt 100 miles distant. The death list is provisionally placed at forty. The powder mills were a plant of the Du Pont de Nemours Company, of Wilmington, Del. In the last ten years nine explosions have occurred at Pleasant Prairie, but none comparable with the present disaster. Citizens of that section of Wisconsin desire to prevent the powder works' restoration.

Transportation Companies

Eastern trunk lines, following the lead of the Western companies, will abide by the decision of the Interstate Commerce Commission denying their application for a horizontal increase of freight rates.——Appearing before the Railroad Securities Commission, Louis D. Brandeis, counsel for the Eastern shippers in their case against the proposed increase of freight rates, stated that he had concluded that Government regulation was necessary for the welfare of the railroads, as well as for that of the shippers and the public. State regulation is a failure, he said, citing Massachusetts. ——Drivers and helpers of the Adams Express Company in New York and Jersey City went on strike again last week. They allege that men active in the last strike have been discharged at the first opportunity. As we go to press, the strike has not yet become locally general even within the one company. Violence has already been resorted to.——The Trenton (N. J.) Street Railway Company was fined $50 March 10, in a police court, for violation of the "no seat no fare" ordinance passed in April, 1910. An appeal will be taken to the Supreme Court of the State.

South and Central America

It is thought at Washington that the revolution in Paraguay, against the Government controlled by Colonel Jara, will be successful. At the end of last week, the revolutionists had possession of Concepcion and of the country for half the distance from that city to the capital. Martial law for five months has been proclaimed.——In Honduras, on the 8th, Dr. Francisco Beltran (selected for Provisional President at the peace conference) was elected First Vice-President by Congress. This action will make him the constitutional President upon the retirement of Davila. A complete restoration of peace was delayed only by the course of Colonel Ferrari, a revolutionist commander whose forces held positions menacing Tegucigalpa, the capital. He refused to withdraw from these positions. Therefore the Government's troops took up the arms they had laid down, and prepared to defend the capital.——Dr. Araujo, the new President of Salvador, asks Congress for a grant of amnesty to all political exiles.——Ernest H. Wands, the American financial adviser of the Nicaraguan Government, is on his way to this country, where he will consult the State Department and talk with bankers about negotiating a loan of $12,000,000 or $15,000,000.——Costa Rica's contract with Minor C. Keith, of the United Fruit Company, for a loan of about $8,000,000, to refund the foreign debt, is approved by the people of that country.——A syndicate of American capitalists, among whom are ex-Senator Clark and ex-Governor Spriggs, of Montana, has obtained from President Cabrera a broad concession permitting the exploration of Guatemala's public lands for minerals, the construction of railroads and telegraph lines, etc. It has not yet been approved by Congress.

The House of Commons

Surprise has been exprest that little interest has been aroused during the past weeks over the discussion of measures of such great importance as the Veto Bill, but as tho reacting from its previous calmness the House became wrought up over the Budget Bill to an almost unprecedented pitch of excitement. The session lasted from 3 o'clock in the afternoon until 10 o'clock in the morning and at times the disorder was extreme. The land clauses were under consideration and the Home Secretary, Winston Churchill, was in charge of the bill on account of the absence of Premier Asquith and Chancellor of the Exchequer Lloyd-George. Great personal animosity was shown to Mr. Churchill by the Opposition and he responded in language so sharp that several times the chairman was obliged to call him to order. In spite of the obstructive tactics of the Opposition, Mr. Churchill forced thru the bill clause by clause by the use of the closure or previous question. At one time during the night the heated antagonists seemed about to resort to violence. When the Irish Nationalists were manifesting a delight in a noisy demonstration, Capt. James Craig, Unionist member for East Down, sprang to his feet and declared that the Opposition would be pleased to pitch all the Irishmen out of the House if the Chair would give its consent. John O'Connor, from North Kildare, promptly exprest his hope that the honorable and gallant member would try it.——The question of reciprocity has been brought up repeatedly in both Houses of Parliament, the Opposition asking for information as to the part played by Ambassador Bryce in the negotiations. The Government responded that no instructions had been sent to Mr. Bryce and his action had not been questioned. It was customary for the Ambassador to give advice to the representatives of Canada in all diplomatic difficulties with the United States and Mr. Bryce had been very serviceable in settling such questions.——The opposition to the Mormon missionaries in England has been made a subject of inquiry in the House of Commons and Mr. Churchill is giving the subject consideration. Public meetings have been held in various parts of England by the Preventive and Rescue Committee of the National Union of Women Workers. According to the official report of the Mormon mission there were during the

year 1910, 1,178 missionaries in Great Britain who visited 68,139 houses and distributed 5,588,415 tracts and held 14,766 meetings. Polygamy is not preached in England but it is feared that many of the young English girls who are brought to America by the Mormons may be drawn into "plural marriage." One of the strong inducements held out to English women is that when they come to Utah they will get the right to vote. According to the opponents of Mormonism 3,500 young girls are enticed to Utah every year from England. Senator Reed Smoot denies the charges and states that the total number of Mormon converts last year amounted to but little over 1,000, and of these there were only sixty-eight young women between fifteen and twenty-five years of age.

The Referendum in England

The question of the referendum was brought into the political arena by the Opposition in the middle of the late election, and somewhat disconcerted the Liberals. It was, however, impossible to dismiss the matter when it was once made a political issue and there has been much discussion of it ever since. Now it has taken definite form in a bill introduced by Lord Balfour into the Upper House. He dislikes the Latin term, preferring to call it "reference to the people." According to his plan any bill passed by the House of Commons and rejected by the House of Lords, or so amended as to be unacceptable by the House of Commons, shall, on demand of either House, be submitted to a poll of the parliamentary electors of the United Kingdom. A bill passed by both Houses may also be submitted in like manner if not less than 200 members of the House of Commons petition for it. Plural voting is not to be permitted in the referendum. Lord Balfour in presenting his bill argued that it was in accord with the fundamental principles of the Government from the remotest time, for Tacitus said of the Germanic races: "On smaller things the chief men deliberate; on greater matters all the people." He called attention to the fact that the system was in operation in Switzerland and in some of the United States and of the British dominions beyond the seas. Lord Crewe, in opposing it, declared that the bill meant the destruction of the representative system and a wider defection from the constitutional practices of the last 600 years than almost any other measure that could be proposed. The referendum would, he said, involve the initiative, and would bring before the people for a final decision complicated questions in which they had no interest. Lord Tennyson and Lord Selborne spoke in favor of the referendum.

The Trial of the Camorrists

The Italian Government is engaged in a desperate effort to crush the Camorra, the criminal conspiracy which has from time immemorial defied the law in Southern Italy. The particular crime of which the forty-two prisoners are charged is the murder of Gennaro Cuoccolo and his wife, Maria Cutinelli Cuoccolo, June 5, 1906. Ever since then the Italian Government, aided by the police of the United States, France and England, has been engaged in running down the perpetrators of the crime. Joseph Petrosino, the New York detective, who arrested the ringleader, Erricone, in Brooklyn, was assassinated on the docks at Palermo by the Camorra, tho the connection of the prisoners with this crime has yet to be proved. The chief evidence for the prosecution is the confession of Gennaro Abbatemaggio, one of the Camorrists, which was obtained by Capezzuti, a carbineer who, living for years in the lowest quarter of Naples, had gained the confidence of Abbatemaggio and got him in his power. According to this confession, Cuoccolo was appropriating to himself more than his share of the booty obtained by the robberies and aspired to oust Erricone from the leadership of the Camorra. At a meeting of the Camorrists, held in a country inn near Naples, and including sixty delegates, two from each quarter, the death of Cuoccolo was decided upon. Six Camorrists lay in wait for him in a dark lane in Torre del Greco, a suburb of Naples, and killed him with sticks and knives. Two of them then took the

street car for the flat of his wife, in a fashionable quarter of Naples, and murdered her. Erricone and the other leaders of the Camorra were dining at the trattoria or tavern of Mimi a Mare, when two of the assassins entered and informed him that the deed was done. Many of the band were arrested soon after, but their release was secured by their "guardian angel," the priest, Don Ciro Vitozzi. The trial is being held at the little town of Viterbo, where the church of San Francesca has been converted into a courthouse. A large iron cage has been constructed in the right transept, in which thirty-five of the prisoners are confined to prevent their rescue by the people, and nearby is a smaller cage in which the informer Abbatemaggio is placed for protection from the Camorrists. The priest is allowed to sit outside. The lofts are used for press and spectators. There are over 300 witnesses for the prosecution and as many for the defense. The town and prison are thoroly guarded by troops. The chief prisoner is Enrico Alfano, better known as "Erricone." The treasurer of the Camorra is Professor Rapi, formerly a teacher in the municipal schools of Naples. Nicola Morra and Maria Stendardo, his mistress, at whose house Professor Rapi gave the six murderers their instructions, and to which they returned for the purpose of washing up after the deed, are also among the prisoners. Great difficulty is experienced in getting a jury, because the vengeance of the Camorra or "Black Hand" is quite sure to fall upon any concerned in the conviction. Large sums are being raised by the Neapolitans in New York for the defense and the Camorra has protectors in high political and social circles. Many of the inhabitants of Viterbo have left the country to avoid being called on the jury.

Spain, Portugal and the Vatican

The most important question that has been brought before the Cortes, which met on March 6, is the Religious Associations bill, for the purpose of restricting the monastic orders. The bill as prepared by Premier Canalejas has met with the approval of his Cabinet and the King, and will presumably command a majority in the Cortes. There has been so far no absolute break between Spain and the Vatican. On the contrary, Canalejas is still engaged in negotiations with the Holy See, but the Pope insists that during the negotiations the Spanish Government should abstain from formulating laws which could anticipate or prejudice the result of the negotiations themselves. Canalejas, however, refused to submit his bills in advance for the approval of the Vatican, and declares that he will introduce the Religious Associations bill before the end of the month in any case. To quote his own words:

"I will negotiate for a limitation of the religious associations, but if a friendly agreement is not reached with the Church the most drastic measures will be adopted in dealing with the associations."

——The provincial elections of March 12 passed off quietly, with the exception of a fight between the Socialists and Republicans in the streets of Bilbao, in which several persons were hurt.——At Barcelona a speaker who was attacking the character of Deputy Lerroux at a meeting of Catalan radicals was fired upon by a man in the audience. The shot missed and the man was seized by the bystanders before he could use his revolver a second time. Señor Lerroux was expelled from the ranks of the Republican party on the charges of corruption and abuse of position.——The leading Catholic journal in Great Britain, the London *Tablet,* prints the following from its Lisbon correspondent:

"With regard to the revolution in Portugal, surely Catholics elsewhere ought not to be afraid to trust the destinies of a Catholic nation to the people.

"Now is the time to learn whether or no in the past the Portuguese clergy have used their opportunities to instruct and strengthen their people in the Faith. . . .

"Why don't Catholics honestly face the question of the exemption of religious orders in many countries from taxation, or, at any rate, due taxation? As they have no families to rear, it is just that the lands and business undertakings of the orders should pay heavier taxes than those of the people, not lighter ones.

"And certainly in settled countries, limits should be placed on the undue increase in their numbers. Then if, by the grace of God, there is an increasing number of vocations, let the aspirants become apostles, and seek new lands like their fathers in the Church."

Present Conditions in Mexico

BY DON F. LEON DE LA BARRA

THE MEXICAN AMBASSADOR TO THE UNITED STATES

HAVING been absent from Mexico during nine years in the discharge of various diplomatic duties, I have been able to understand with a calm and impartial judgment the political situation of my country, its march on the path of progress and the evolution that has taken place during the last years. On this consideration, I have gladly accepted the kind invitation which has been tendered to me by the distinguished editor of THE INDEPENDENT, in order to state briefly in his magazine the present conditions of our policy.

I trust these lines will show the profound feeling of love for my country, which has always encouraged me in the discharge of the diplomatic duties which have been entrusted to me.

Why, the foreigner asks himself, has peace been disturbed in a country whose finances are flourishing, whose industries are prosperous, and whose Government works strenuously to improve the knowledge and well-being of the people?

The facts demonstrated by our progress during the past thirty years are undeniable; the surplus of the treasury has exceeded 160,000,000 pesos, which amount has been devoted in part to works for the general benefit of the people, and which is the result of the superhabit attained in the last ten fiscal years, thanks to the powerful hand of a capable and foreseeing Administration; our securities abroad reach the highest quotations of any of the Latin-American bonds; the figures of our international commerce show an increase of more than 300 per cent. in thirty years, and the development of our mining industry places us in the front rank as producers of silver, and in the third as producers of copper.

Public instruction has become widespread; the irrigation works, which the Government favors strenuously, have already begun to show their influence on agricultural production, which will increase every day, and the net of railroads, which in 1876 hardly reached a little over 600 kilometers of track, and which today exceeds 24,800 kilometers, affords facilities to industries and commerce and co-operates to spread civilization thruout the republic.

Under such conditions when Mexico had just finished celebrating with true enthusiasm the Centennial of our Independence, demonstrating with just pride the progress it had achieved and the firm and conscious national unity, a seditious movement breaks out during the month of November last, the importance of which was greatly exaggerated by the press and public opinion, perhaps due to the surprise that such an unexpected and sad incident produced.

Insignificant as are the elements on which the seditious movement has depended, in comparison with the large resources of the nation and the strength of its Government, the mere news that peace had been disturbed in Mexico, was sufficient to produce a panic in certain pusillanimous people; it aroused mistrust abroad; encouraged some visionary dreamers who thought they could find the opportunity to change a political administration that has been leading right along a rapid and firm march on the true path of progress; stirred up the malcontents, who are always to be found in every country and at all times; exciting at the same time the ill thoughts of those who only thrive in times of trouble, and to whom, in mine as well as other countries, suits the old saying of the Romans, "*Turbatis rebus, improba valent.*"

Looking into the matter thoroly after the alarm wrought by the first news and the true importance of the seditious movement became known, calm among the people has come back again, who understand that order will be re-established, thanks to the means at the disposal of the Government to defeat the seditious in the guerrilla warfare they have started, and mainly on account of the discouragement there is even among the promoters of the sad undertaking, for the lack of sympathy in the republic and the

thought of the grave dangers to which they might have exposed their country thru their preposterous undertaking.

Among the seditious in actual rebellion can be pointed out three groups: the beguiled who honestly have thought themselves the apostles of democracy and progress; the vanquished in the struggle of life, either thru their own incapacity or thru other circumstances, who aspire to figure in a new regime that can afford them field for their activities that are not always wise; and those individuals, the dross of society, who are ready to fight for any cause by which they can profit and make use of for their evil intentions.

The first have thought that thru a revolutionary movement they would change the situation in the republic, which they did not think satisfactory, casting into oblivion the teachings of history, and failing to recognize, with a mistaken and near-sighted judgment, the advantages attained during the course of late years by the honest, patriotic and enlightened administration over which General Díaz has presided.

Seeing only some defects in certain secondary administrations (in what country are there none?) and wishing to remedy certain deficiencies that are in reality the result of our ethnic and social conditions, they have failed to recognize the wonderful evolution that has been taking place in the people of our country as a result of the diffusion of public instruction and the advantageous situation in which the working classes are, due to the progress of our industries.

These individuals, if they are sincere, will admit that their act, instead of being beneficial, has been harmful by exciting evil thoughts and creating conditions more delicate every day. Their duty should have been that of the true apostle, if they thought it so, co-operating by their writings, preachments and examples to accelerate the evolution that has been started, thus contributing within the law and under its protection to the great work of national unity, which has been one of the patriotic aims of the work of our Government.

In their propaganda they never found any obstacles as long as they kept within the limits of the law, the respect to private life and the maintenance of order. They now must have realized that the country has progressed, that the Government, promoter of evolution, follows it and encourages it, and that they have not improved themselves, as their actions show the improvision that inspired many of the leaders of revolutions during the sad epoch of our civil wars.

It would be a good thing if they could clearly see wherein rest the real interests of Mexico, and thru the light of a patriotism that studies the past, act wisely in the future.

The present situation in the republic is as follows: In the North, in a portion of the State of Chihuahua, some forces made up of malcontents who are against the local administration, without any military organization, properly speaking, keep up a guerrilla warfare in which they will soon be subdued by force of arms, notwithstanding the advantages that kind of warfare gives them in a mountainous country.

The political policy of our Government in furthering the work already undertaken has contributed to inspire confidence in anxious minds, who not only see it with satisfaction, but have become supporters of the cause of order, as are all those who have created interests in our country.

I believe that the small revolutionary movement in Chihuahua will be suppresst and that we all will work anew, united in the same high and generous spirit, strengthening our nationality and, thru the efforts of our labor, as workingmen or as persons devoted to intellectual prusuits, as men of action or Government officials, making the civilized world —which showed us so much consideration during the celebration of the Centennial of our Independence—forget a transitory excitement in our life of peace and progress, and applaud the constant and firm impulse with which all of us will work, with the aim that our progress should be more certain and our democracy more effective within order, and to become worthy every day of the respect due to countries which, like ours, are zealous of their sovereignty and know the obligations imposed on them by the international law.

WASHINGTON, D. C.

The New Parliament in Westminster

BY JUSTIN McCARTHY

THE opening of the new Parliament in Westminster has been signalized already by some momentous announcements and some equally momentous suppressions on behalf of the Liberal Administration, led by Mr. Asquith. It was announced on the part of the Administration that the time of the House of Commons is to be asked for at once in order that the legislation for the absolute suppression of the power exercised by the House of Lords on measures for taxing purposes may be absolutely abolished. Such, therefore, is to be the first work of the new representative chamber, and the accomplishment of this great legislative work will in itself be enough to give to the session of 1911 an abiding place in history.

On the other hand, there is no mention made in the Speech from the Throne of any determination on the part of Mr. Asquith's Government to bring in a measure for the creation, or, rather, the restoration, of an Irish Parliament. It is, however, thoroly understood that this omission does not indicate any determination on the part of the Government to delay the success of Ireland's great national claim for a restoration of her parliamentary assembly.

The desire of the Liberal Government naturally is to get done at once and forever with the power of the hereditary chamber over the finances of the people, and as soon as that is done to begin the accomplishment of the other measures which are recognized as essential to the future tranquillity of the King's dominion in Europe. The common expectation of all who have had opportunities of intercourse with men who are near to the center of political life and with whom I have recently met is that the present Administration, or, at least, the most important members of that Administration, have made their minds distinctly up to the acceptance of home rule for Ireland, and that announcements to that effect will soon be made to Parliament and the world outside.

An amendment to the address is, we are told, to be moved next week by a member of the Opposition, acting under the advice of Mr. Balfour, the Conservative leader, and declaring in regular and conventional Tory style that the passing of home rule would be destructive to the whole principle of civil government in Great Britain, but especially in Ireland herself. This amendment apparently has for its object to induce the House of Commons to believe that the great object is and always has been to save the Irish people from the merciless efforts of their most determined enemies and fellow countrymen, Mr. John Redmond and his followers in the present, and such men as Parnell, O'Connell and Grattan in the past. I do not myself know anything as to the gifts of persuasion possessed by the member who is to propose this amendment, but he must assuredly be, to use some celebrated words of Byron,

"With all that Demosthenes wanted endowed,
And his rival and victor in all he possessed,"

if he can persuade any number even of Tory members to follow him into the lobby, supposing he can actually press the amendment to a division. For my own part, therefore, I should feel very much inclined to hope that the member in question will press his amendment to a division and thus convince the Irish people that the cause of home rule is with every session more and more fairly and thoroly appreciated by the great majority in the British Parliament.

The same steady growth of opinion in favor of the home rule cause is growing more and more evident among all classes of the British public in the dominions of King George. Of course, there are some journals in England, and some even in Ireland itself, which have been and ever will be, for reasons best known to their owners and managers, pledged against the cause of home rule, and which will maintain their position to the very last, as was done by journals of the like resolve in the days before Catholic emancipation and free trade.

King George V is unquestionably a very popular sovereign. This fact is so

much the more remarkable because he succeeds in order of name to that sovereign whom the great English poet described as "the fourth of the fools and oppressors called George." George V has already given many proofs that he possesses courage as well as wisdom, but I do not think he has given better proof that he possesses both than in his recent coming down from his throne and going as a private suitor into one of his own courts of law to plead for its condemnation of a series of libels against him. The whole story is by this time as well known on the American as on this side of the Atlantic, and I therefore only desire to give to the public of the United States my own views on the subject. My own conviction is that King George gave another and a very convincing proof of his courage and his judgment alike when he undertook to disprove the base calumnies published against him by taking just the course which any ordinary citizen would have to take under like circumstances by bringing a criminal action against his calumniator in a court of law and compelling him to defend himself there. Of course, when the story came to be told in a court of law it was promptly shown on the clearest evidence that it was nothing but the most meaningless and even grotesque of criminal libels. The libeller got off with a sentence of twelve months' imprisonment, which really was but a slight penalty for so gross an offense. The case was called Rex *vs.* Mylius, and Mylius, whose name does not seem to have much of a Britannic sound about it, was the publisher of the libels. The libels were printed in Paris, but the printed sheets were sent over to Mylius and put into circulation by him thruout England. I think King George showed at once his courage and his judgment when he made himself the public prosecutor in such a case and submitted his calumniator to an ordinary court of criminal law in London. The King would in fact have gone into court himself and given there his evidence, as any ordinary citizen would have done, but that he was advised by the Law Officers of the Crown that it would be unconstitutional for him to do so. At least one sovereign realizes that the era of civilization has been reached when a monarchy can be found whose ruler does not believe that he possesses any arbitrary power outside and above the existing courts of law to inflict any punishment on a subject for an offense which the already existing legal tribunals of the country have a full authority to investigate and to punish. The whole event is all the more interesting because it has made itself part of the history of the coronation year. The coronation, which takes place in the month of June, will make this year memorable in history and an interesting event in the earlier history of the year which is associated with the life and the doings of the British sovereign so far already uncrowned. If it also should become associated

THE KING IN HIS ROBES OF STATE.

At the opening of his first Parliament, H. M. King George V wore the uniform of an Admiral of the Fleet.

with the abolition of the extraordinary control over the popular finances already and still possessed by the hereditary and thus far practically arbitrary house of hereditary legislators, then it will prove indeed a memorable year. There must, however, be some events of sadness casting their shadow on every year of all but the shortest reign.

The sudden death of Sir Charles Dilke has removed one of the most conspicuous figures in the parliamentary and the public life generally of the British dominions. His death could not indeed be set down in any sense as premature, for he was actually in his sixty-eighth year when he was carried away from the world in which he had won so much success in so many fields, but when we here in England talked of Dilke, which we did very often, we never seemed to associate him even with the idea of old age. To use a once familiar expression, he seemed all alive whenever and wherever you came in sight of him. He had ever been a Radical by strong convictions, but if on any particular question, political or social, the Tories happened to coincide with his views, he was quite willing to accept their temporary comradeship without giving himself any airs of superiority. I was well acquainted with Charles Dilke personally during many years of his life, and he became a strong supporter of the Irish home rule cause. He even gave his support to Parnell's policy of systematic and proclaimed obstruction in the House of Commons, and I can well remember how, when that policy of obstruction came to threaten certain difficulties to the national cause, the first English member with whom Parnell and I went to take counsel was Charles Dilke. As every one knows on both sides of the Atlantic who knows anything about England's public men, the career of Dilke was seriously marred for a long time by a certain scandal which came upon him, and which, as the general public would have it, he had brought upon himself. It brought him, however, into a court of law, but even the verdict of the court did not make him out more open to public reprobation than many other of his contemporaries in the social and political world. As regards the integrity of his public life, there was nothing that even his most prejudiced political opponent could say. My London home was for some years in the same quarter of the great capital as that in which Dilke had his residence, and I was a frequent visitor at his house during the lifetime of his second wife, the authoress of "Claud Lorrain, Sa vie et ses Œuvres" and "The Shrine of Death." I had not seen much of Charles Dilke for some time past, but I can never think of him otherwise than as a friend and as a great political figure. He had been a great traveler in his time, and he was well acquainted with the history of

QUEEN MARY AT WESTMINSTER.

The Queen's black gown made even more resplendent the wonderful jewels she wore: the two greater Stars of Africa and the two lesser Stars; all of which are known also as the Cullinan diamonds. The largest of these stones weighs 516½ carats.

SIR CHARLES DILKE.

most countries. Indeed, it would not be too much to say that there were few countries on the globe's surface with which he had not some personal acquaintance. He had always been very close in his attendance at the House of Commons whenever he was in England. Charles Dilke had indeed many occupations. He was a barrister of the Middle Temple; he was an author of many books, chiefly on historical and political subjects; he was chairman of a commission for negotiations with France, and was chairman of a commission for considering the question of the housing of the working classes, besides being Under Secretary for Foreign Affairs and President of the Local Government Board, these two being very important Government offices. It was often a perfect wonder to me how he contrived to perform all the functions of these offices and to combine them with the various other duties which he was ever ready to undertake, with the object of lending his help to all manner of public undertakings. Dilke was never a great orator in the more exalted sense of the word. He was a thoroly effective speaker, and could argue out, expound and illustrate effectively and also concisely any subject, however difficult, which he felt himself compelled to deal with, but with the mere graces and flowers and the passionate outbursts of oratory he never appeared to concern himself much. He had a distinct sense of humor, and was often very telling in his satirical passages. Sir Charles Dilke was the grandson of the man bearing the same name and title and who was the founder of the weekly literary and critical journal so influential and indeed so famous among authors and critics for many years, and I hope and believe holding its high position still. Of course, I need hardly say that the journal on whose fame the late Charles Dilke has an ancestral claim is *The Athenæum*.

The coronation of King George seems likely in itself to leave a distinct impression on the history of this year. I see noticed in the London newspapers of this day, as the most interesting statement yet made in reference to the foreign guests to attend the coronation of King George in the month of June, the statement that Admiral Togo, the hero of Tsushima, and General Nogi, the captor of Port Arthur, are to accompany the Japanese mission. Then there are announcements made of a very different order from anything associated with war by sea or land, artistic schemes for the foundation of a national theater for Shakespeare in London. A project of this latter order would assuredly receive most sincere and genial encouragement from visitors and readers belonging to the United States, and if the reign of King George V could be further marked by a memorable event, I think the sovereign might be pleased on hearing that the year of his coronation was further commemorated by the foundation of a national Shakespearean theater in his capital.

LONDON, ENGLAND.

International Bad Manners

BY AN AMERICAN SOJOURNER IN CANADA

[The author of the following article, for good reasons, prefers not to have his name used. We may say, however, that he has been engaged in distinguished educational work in this country, that for many years he has spent his summers in Canada and during the past winter has been living in Montreal.—EDITOR.]

MR. A is the proud possessor of an immense landed estate. His broad acres touch with a much smaller property of Mr. B, who takes a pride, quite equal to Mr. A's, in keeping his ancestral homestead for himself and for his children's children. But, one fine day, Mr. A publicly announces that he is "getting ready to annex" Mr. B's property. Would not all decent-minded members of A's community agree in denouncing his speech as the bad manners of a man whose riches, and social and political power, had made him brutally blind to the ordinary amenities of polite society?

In order properly to appraise certain recent Congressional utterances upon the possible annexation of Canada, let us put the shoe on the other foot. Suppose that, before the War of 1812, the Premier of the English Parliament had announced in the course of a debate in the Commons (in the hearing of the whole world) that Great Britain was "getting ready" to reannex the American States. Would the fact that the English political leader was quite as sincere as his modern American counterpart, the Speaker-elect of the new House, in thinking only of a peaceful annexation, have made our forefathers less likely to resent such a public announcement as a wanton insult to the *amour propre* of the young republic?

The Bennet resolution, in which the President was formally requested and authorized to begin negotiations with England and Canada for the annexation of the Dominion, was, of course, far worse than Mr. Clark's *obiter dictum*. And yet, altho a few of our Canadian cousins, and perhaps still more of our English uncles, as they read that resolution, may have had a passing attack of "ghosts" and begun to "see things in the night," the resolution itself has never been taken seriously by any well-informed person in the United States, least of all by its author.

It is reported that Mr. Bennet in an interview insists that his resolution was offered in good faith; but if the reporter was looking sharply he must have seen a twinkle in Mr. Bennet's eye and a smile lurking at the corner of his mouth. The gentleman from New York cannot persuade discerning men to believe in his sincerity in this matter except at the expense of his own reputation for common sense. He has had considerable experience in public affairs and is acquainted with diplomatic usages. He knows very well that his impertinent formal proposal that our President should take steps to annex our neighbor's country was intended for effect *outside* the Halls of Congress; but, in this instance, his "County of Buncombe" was not the Seventeenth Congressional District of New York, but the Parliament Buildings in Ottawa and at Westminster.

The Bennet resolution was such a breach of international good manners that it has made most Canadians laugh at him, just as all sensible Americans did—altho American laughter was strongly tinged with a sense of humiliation that a Congressman from the cosmopolitan city of New York should have taken such a light view of his responsibilities as a member of the national legislature. His resolution was so absurdly impertinent that it has already defeated its own purpose. Its only effect will be to make it impossible for him to be remembered as a serious-minded legislator.

But the other expressions of Congressional opinion, squinting more or less openly to the possibility of reciprocity leading to annexation, are far more mischievous.

To men who are used to the ordinary courtesies of private life, it passes comprehension that certain of our law-makers at Washington have so far forgotten the responsibilities attaching to their position as to talk about annexing our neighbors' country, and at a time, too, when Canada has given no indication whatever that she has the slightest interest in such a chimerical proposition, but has shown that she intends to preserve her present autonomy.

When, in the face of these facts (which are patent to all the world), the Speaker-elect of the Sixty-second Congress, in the course of a debate that was being listened to by the entire world, announced that "we are preparing to annex Canada"; and when certain Senators are reported as endorsing that sentiment and as saying that they, too, are in favor of annexation, even before Canada has even hinted that she might some day wish to be annexed—the verdict of the great world outside of the United States must be that these gentlemen have been guilty of a gross breach of international good manners.

In the relations between nations, especially when responsible officials are the offenders, bad manners have the effect of disturbing thoroly friendly intercourse, and they add unnecessary obstacles to the promotion of good feeling and the development of commerce, just as would be the case in private life.

The Americans in Canada who know the genial gentleman from Missouri do not like to be compelled to assure our Canadian cousins that Mr. Clark is something of a joker, or at least that he is a little too much inclined to brag. His American admirers in Canada and elsewhere do not enjoy reading the otherwise humorous crumb of comfort which the New York *Sun* throws out to the Canadians when it answers them that they need not be worried over what Champ Clark says upon this subject, because he will "probably annex Mexico next morning!" His bit of "spread-eagleism" painfully reminds the judicious of the well-known European caricature of the bragging type of American, who once boasted that *his* country was "so big that it was bounded on the north by the aurora borealis, on the south by the procession of the equinoxes, on the east by the primeval chaos and on the west by the day of judgment."

Mr. Clark has not added to his well-deserved reputation as a wise legislator and a political leader by his very superficial thinking upon the relations between reciprocity and annexation, and his still more foolish words upon this subject. His wild words have simply irritated our northern neighbors, and will fill them with the groundless suspicions that in every move our country makes, in the future, looking toward closer and mutually beneficial commercial relations with Canada, Uncle Sam has the thought of annexation in the back of his head.

To observe the mischievous effect of Mr. Clark's announcement, and of similar utterances reported as coming from certain well-known Senators, one must come up here to Canada, and note the impression these utterances have made upon thoughtful Canadian patriots, who, while many of them would be glad, for the mutual advantage of both countries, to trade with us upon the basis of the pending Reciprocity Agreement, are justly proud of the great nation they are building up, and who, in the judgment of discerning men in both countries, are wisely tenacious of their autonomy and separate national existence.

Mr. Clark's announcement, and the reported Senatorial utterances along similar lines, have scattered all over Canada the seed of groundless suspicions of the United States, and of Americans generally, which it will take many years to eradicate.

MONTREAL, CANADA.

Why Young Men Leave the Farms

BY TRUMAN S. VANCE

EACH year, when the Agricultural Department announces a still further increase in the value of farm products, the newspapers proclaim a sort of harvest festival, in which the farmer is the central figure. Bumper crops worth eight billions, good prices and prosperity are talked of, hats are thrown up, there are shoutings and congratulations, and the farmer has the good manners not to mar the festivities by any forcible complaint. But he has two very real and increasing troubles. He can scarcely get the labor to harvest those bumper crops and his sons desert the farm, and in his old age he is overworked and lonely.

LEFT BEHIND IN THE RACE.
Boys that grew up with him are now carpenters and artisans in the cities, and their children are getting a good education.

Taking Virginia, which is characteristic of other Southern States, and, to some degree, of all States having a rural population, 60 per cent. of the young men leave the farms, most of them before they are twenty years old. Of the 18 per cent. that enter colleges and higher preparatory schools, enough come back to the country as preachers, doctors, school teachers and others to affect community life to some extent, to reduce the net loss to 55 per cent., or about 11,000 each year. The last census states that there were, in 1900, 607,000 native-born Virginians living in other States, while the Old Dominion had adopted but 132,000 born in other States. The net loss of 475,000 falls entirely on the country communities, as most of those from other States settle in the cities, which, in turn, give up but few of their population to other States. The financial loss of this exodus of nearly half a million, most of them wage earners, is not less than one hundred millions of dollars a year to this one State alone. And every boy, who cannot be reared and educated for less than $2,000, represents perhaps the only savings account his father ever had.

Added to this loss of over half the life blood of the country is a poverty of the blood that is left. While great numbers

of young men are left in the country that are fully the equals of those that leave, they are necessarily under the domination of the older generation, which in all professions is intensely conservative and hard to induce to try new methods. Then, too, a far lesser percentage of farmers' sons stay in the country than of tenants' and laborers' sons, who are more lacking in education and other qualifications for the new type of scientific farmer and progressive citizen. With these conditions prevalent, it is not strange that in the country today good roads, better schools and churches and community life in general suffer the blight of a half-settled country. Let us see the specific out-croppings of this general condition.

To begin with, everything in rural life seems to conspire to emphasize its hardships and privations. Several years ago I drove by a country schoolhouse on a very cold day. Out in the yard two little boys ten or twelve years old were cutting some snow-covered wood with an ax so dull that it seemed to rebound when it struck the wood. Within, the teacher had a score of children gathered about the stove, a disorganized, ineffective group. Seven window panes were broken and several of these entirely gone, slates and books being used as the most available substitutes. Such schools are not entirely a thing of the past. The old type of school superintendent, who too frequently pocketed his slim salary as a sort of reward for superior discernment, in that he had aligned himself with the right side in the last political struggle, has given place to the better paid and more efficient one, but in many districts, trustees of the right sort are absolutely unobtainable. But the point is this: those neglected school children will always wrongfully charge these privations to country life. Some of them are now of college age and if any have not given up the strenuous pursuit of knowledge by this time, steam-heated buildings and a few years of well-ordered college life will fix their determination to leave the farm.

THE OLD AND THE NEW.

CHAMPION SEED CORN GROWERS.
These boys hold the championship for Northern and North Central Texas.

The discomforts of most country homes is a matter of constant wonder to city people. It must be remembered, however, that in the city one buys for the sake of the house, the lot being an incidental matter of size and location; while in the country one is governed by the land, on which he must make his living, and the house is merely incidental. Slight as this distinction may seem, it has led to a deplorably minimized estimate of the farmhouse and its comforts. People that rebuild on their farms are very generally putting in all they can afford of modern conveniences and comforts; but nine-tenths of the farmers in the older settled States live in houses of others' building.

The second real cause of this cityward exodus of country boys is the dearth of social life and general absence of community spirit. A country doctor, speaking from an experience of over forty years of practice, once said to me: "Even after the war we had spelling bees, singing schools and debating clubs all thru the country, but I have seen these die out one after the other till there is nothing for the young people to go to, and I do not wonder that they flock to the cities." Of recent years, in the wealthier counties, moving picture shows, skating rinks and bowling alleys have sprung up in the small towns, furnishing entertainment to the people living in and near them. We should not condemn these, for it is natural for them to rush into this social vacuum. Let the blame rest on those that failed to give the better entertainment. But, put the blame where you will, they have dealt a serious blow in the disruption of community life. They furnish entertainment that produces no leaders, that makes the country boy turn his eyes toward the town for his amusements, and, to his mind, forces home the contrast between the bareness of country life and the superior opportunities of the town and city.

The most potent reason of all, however, is purely economic. It is safe to say that 90 per cent. of the fathers in the country give their sixteen or seventeen year old boys no wages or definite interest in stock or crop. They no doubt feel that they are giving them as much as

either would amount to, in board, clothes and spending money; but the difference is fundamental. A boy of that age wants to make a start in life for himself, and if it is given him on the farm he is content in the feeling that he is earning his living, while if it is denied him, he very soon goes to the city in search of the opportunity he feels that the farm would not afford him. And again, the farm is charged with what should be rightly charged, I believe, to parental unwisdom.

It is true, as is often charged, that many leave the farms because of impulsive decisions and hastily drawn conclusions, but I have learned to rely more and more on the correctness of a boy's rough-and-ready reasoning and helter-skelter deliberations in matters concerning his own affairs. The country boy sees that farming requires an average investment of from $2,000 up to $20,000, according to the section in which he lives, and that the returns, above interest on his investment, do not give more than farm wages to the owner. So he usually concludes that as he has but little, if any, money to invest, he will go where wages are higher and chances of partnership are better than on the farm. Let us see how near correct his conclusion is. Farm products of 1899 in the United States amounted to three billions of dollars, and ten and a half millions worked on the farms to produce them, or an earning of $285 per capita, or $570 for the family of six. This represented the earnings of two workers and dividends on an average investment of $3,000. In the Southern States, the annual earnings were $354 to each family of six, this being for the labor of two members of the family and returns on an average investment of $1,800. In other words, what our country boy instinctively *senses* is the unwelcome fact that the American farmer, with his boy or hired man, by working hard all the year, got 19 per cent. on his investment of $3,000, and in the South 20 per cent. on his smaller investment of $1,800. Even the bumper crop this year, worth eight billions, will net the farmer less than six billions when fertilizer, implement and freight bills are paid, along with insurance and general cost of upkeep of stock, implements and improvements. When we deduct 6 per cent. for interest on the twenty billions invested, we have an average earning of $450, or $900 to the family of six in the United States, or about $550 per family in the South. This would tempt many a young man if the investment were not so great.

Again, our farmer lad knows in a general sort of a way that most country boys get on well in the city. Of course, some are misled by the ex-country boy that comes back to visit his folks, dressed in his best clothes, and apparently with plenty of spending money, but there are saner examples of prosperity he can see among city men that were once country boys. In Lynchburg, Va., the wealthiest city per capita in the South, 154 of the 200 most prominent and wealthiest men were once country boys. A similar investigation of other cities would convince us that it would have been a sad day for our American cities if all the country boys had stayed in the country.

I know that I have painted a dark picture of farm life, unrelieved by any mention of the many that live delightfully and to good profit in the country, but if their greater earnings were taken separately, the picture would be a darker one for the remainder of farmerkind. But I am very optimistic of the future of farming. That the darkest hour is just before dawn is true only in the sense that energetic folks are astir before daybreak and are calling attention to the darkness about them. The farming world is being awakened to the opportunities of a better day that is dawning, not so much by the loud crowing of the agriculturally wise as by the noise of neighbors astir and sawing wood. The 50-acre, well-tilled farm, producing triple the present average yields of corn, wheat, hay and cotton, is now a scattering actuality. Its preponderance will mark the zenith of the farmer's better day, and reduce the city-ward tide of young men to a natural flow of those needed in the cities. Farms of fifty acres instead of three hundred mean six times the number of people in a given community, six times as many to make possible, even imperative, better roads, schools, churches and general community life. There will always be

large tracts held by those who prefer to be land poor. These large holdings, with their small returns, will always facilitate the acquirement of cheap lands by energetic young men, who will convert them into the small, well tilled farms. There is no longer any doubt in the minds of those that know that intensive farming is the most profitable, or that it brings about a co-operation impossible in sparsely settled communities. Its most important bearing, however, on

A CORN FIELD OF THE OLD REGIME.
The yield is about twenty bushels per acre where corn is cultivated by the old system.

the young man problem is that it requires the minimum investment of money and the maximum of energy, which every young man should desire. The real problem is convincing the farming public that these things are so. I base my confident hopes of the future of farming on the progress that is being made in this direction.

First of all, the mental attitude toward farming is undergoing a steady change. Even in many backward country communities, where bad roads make consolidated schools impossible, the little one-room school has a teacher paid enough salary to attend Institutes and Summer Normal Schools. So, while better management is obviating many of the hardships the children formerly endured, an up to date teacher is interesting them in the beauties of nature around them. Not long ago, at a county institute, I heard a teacher of a little mountain school tell of a wonderful nature study work her children were doing. They gathered autumn leaves and watched for the first budding trees and earliest flowers; they kept the moon in the strict path of duty and punctuality by the closest reports on her uprisings and downsittings. I know what this means to a child; for thirty years ago my mother, who had studied under Agassiz, used to talk to me of flowers and rocks, of birds and trees and insects, and today I cannot tear myself

away from country work. When progressive country schools become the rule instead of the exception, and the text books tell more the stories of country life and deal with its problems, early impressions will be favorable to country life and not the first steps in eventual alienation. The agricultural high school, if kept practical, will do much by garden plots and other work to further the agricultural trend in the minds of boys and girls. Some day soon there will be inaugurated a Village Plat System, in which each boy willing to work will cultivate a small plot in vegetables or some crop, to the end that the curse of summer idleness in villages may be lessened and the boys' thoughts given a practical and profitable turn toward agriculture. Older boys should be taken to a farm camp, where each will devote the forenoon to the cultivation of his own farm of two acres, and thereby earn his summer's outing. The Farmers' Co-operative Demonstration Bureau of the United States Department of Agriculture will have this year forty thousand boys in the South each raising an acre of corn or cotton on the scientific principles it is teaching the farmers. A Y. M. C. A. county secretary last year had two hundred and fifty farmer boys in one county in Michigan raising seed corn for a big contest in the fall. And so it goes. When once one gets in the current of things, from every direction comes news of influences at work to win young people to the farm. The National and State Departments of Agriculture could spread the information and inspiration to the farmers and their children much faster than any other agency if they would furnish the country papers with the best of their bulletins and other attractively put information in "plate" or stereotyped form. Not one family in a hundred reads their really excellent Farmers' Bulletins, but one in two reads

A CORN FIELD: NEW STYLE.
This boy has cultivated his field himself, and has raised nearly a hundred bushels on one acre.

MULE POWER OR WOMEN?

some country paper, and little stories of successful farmers, of helpful movements and plans for country houses would reach practically every one thru the country papers, and cost the Government no more than to print certain ponderous volumes that no one but the proofreader thinks of reading.

Against that day of the fifty acre farm, when farmers will live within hailing distance of each other and good roads will make every part of the community accessible during the dull winter months, there is much of social and religious regeneration to be brought about. That ubiquitous organization, the Y. M. C. A., has entered the field, and after fifteen years of struggle for a footing, the Country Life Commission highly commends its work. In fifty counties in nineteen States and provinces county secretaries are gathering little groups of country and village young men and boys together for everything from Bible study to amateur theatricals. The singing schools and debating clubs of former days, baseball, banquets or Bible study are all religious work to these young apostles of the religion of uplift. It is all done thru a system of local leadership. Country doctors, bankers and farmers give practical talks, socials and revivals are held, exhibits at country fairs and athletic meets, all are under the direction of local young men, who form a sort of holding company for interdenominational and general community interests. But the difficulties are great. I doubt exceedingly if any but country boys would regard as possible many of the things they do. Recently a little group of these young people essayed to give a clean little entertainment. There were but two buildings in the community of a public nature, the schoolhouse, which was divided into two rooms, 16 x 20 feet each, and the church, which was not to be thought of. (Oh, that the country church, often the only building large enough to be a community center, would be dedicated to the whole service of God and not to only that narrow bit of it that priestcraft has imposed on us as the whole of it.) The play was finally given in the schoolhouse. The partition between the rooms was sawed around, hung on hinges and swung up to the ceiling of one room, and seventy people were seated and as many more stood inside the building or outside to see the outcome of the first bit of community effort in recent years.

There is need of but small equipment

in this rural work. I know of a little building 10 by 14 feet in which a group of fourteen held their debates, had their reading and social room, and met for weekly Bible class. While only 2 per cent. of the counties in the United States have this work, the number is doubling every three years and increasing greatly in effectiveness. The principle of getting the people of each community under their own problems, yet having one or more paid men in each county to discover and train the local leaders, is undoubtedly the right one. Their work of getting the names of thousands that leave the country and having them looked up and won by the churches and associations in the cities brings help and friends to them just at the time they most need them. If these conquering country boys are to become, many of them, the prominent men of the cities, we certainly cannot afford to lose any of them in the maze of the city's allurements.

But however much we may value the social and religious uplift, we cannot but acknowledge the fundamental importance of economic betterment in the solution of the farm life problem. It is of little use to talk to a man of better churches or more frequent services, or to ask him to subscribe or vote to tax himself for better roads or schools if he is not making enough on his farm to more than keep body and soul together. For all the higher things of life there is needed a basis of reasonable material prosperity.

Brightest of all agricultural prospects is the fact that farmers are beginning to scrutinize present day methods in the light of certain economic principles involved. A man's earnings on farm, as well as in factory, are fixed largely by the energy he employs, and a man can no more afford to furnish all the energy on the farm than in the factory. The man with the hoe can no more compete with the man that has a two-horse team than can the hand weaver with the man that attends ten automatic power looms. Yet it is from attempts to do this very thing that present low averages of farm earnings, and labor troubles, too, arise. In North Dakota, where each farm worker has five and a half head of stock, farm earnings averaged in 1900 $755.63, and in Alabama, where each has three-fifths of one head, the earnings are but $143.98, and thruout the South $177. Thus we see that one cannot afford to hire farm help at even the low average of $200 a year in the South unless he does better than average farming. In much of Virginia and such parts of the South as I have visited, most of the farming is absolutely uneconomic. All thru the tobacco sections, and the cotton country to a slightly less degree, the prevalent custom is to clear up from 3 to 7 acres of woods by hardest toil, plant in tobacco or cotton for several years, and then in corn until the land is worn out and left to grow up in old field pines. Thus when roots are scarcely gone and long before the stumps have rotted, the field is abandoned. The farmer has never known what it is to cultivate that land free of stumps and roots, and as he toiled and struggled along he worked twice as hard and accomplished one-fourth as much as a better farmer would have done by holding it under improvement till stumps were gone and labor-saving machinery could be used.

The man that puts his son or his hired man on a riding cultivator behind a brisk double team can usually keep them both and use them to profit. And, as farmers grasp the idea of intensive farming and its opportunities, they will divide their farms with their boys or sell part on easy terms. Some will take up the cheap but productive lands of the South, where the pine woods, that twenty years ago drove Southerners to the more easily conquered lands of the West, now stand ready to pay for the land they shade.

WARRENTON, VA.

"Ethical" Medicines

BY J. BISHOP TINGLE, Ph.D.

[The author of the article is Professor of Chemistry in McMaster University, Toronto, and has had exceptional opportunities to gain the facts on this very important subject.—EDITOR.]

IT has frequently been stated that we are a "pill-eating nation," and the accusation appears to be justified by the prosperous condition of the enormous number of drug stores in our cities and towns.

The various medicaments used by the public are divisible into four classes. In the first are included the "official" remedies, which are described in the "Pharmacopeia of the United States." A knowledge of the nature of these substances is open to all who care to consult the volume in question, which is revised, under Government auspices, every ten years. The book includes not only a description of various materials, but also specifications and tests for their purity and strength. It may be added that the inclusion of a substance in the "Pharmacopeia" is no criterion of its medicinal worth; some of the preparations in its list have little or no value. Nevertheless, the purchaser of an "official" medicine at least knows for what he is paying.

In the second class are comprised the remedies mentioned in the "National Formulary," which consists of a collection of materials selected by the American Pharmaceutical Association. Of these medicines it may be stated that many are good, many are useless and the remainder are of uncertain value.

The "patent" or "proprietary" medicines, constitute the third class, and, needless to say, they are largely advertised and sold directly to the general public. They are not patented in the ordinary sense of the term, but the names under which they are vended are usually copyrighted. Until recently there was no check on the composition of these mixtures and the unfortunate people who used them might easily become the victims of the alcohol, morphine or cocaine habits. The provisions of the Pure Food Law now compel the owners to state, on each package, the nature and quantity of any of these drugs which may be present, so that the user, if he suffers, does so with his eyes open.

Of patent medicines it is safe to say that a few are useful in certain cases, most of them are entirely without medicinal value, and some are decidedly harmful. All of them are enormously expensive to the purchaser, and no single one contains anything that is not well known to the competent medical practitioner.

In connection with this matter of cost the writer had a significant experience some little time ago. A well known firm in Chicago made a wide distribution, to private houses, of boxes containing specimens of its various remedies, internal and external, liquids and solids. A circular, which accompanied the box, stated that the regular price was $10, but as a special means of introducing the goods the price, on this occasion, was reduced to $5. One of the boxes, absolutely undamaged, was returned to the firm, but, after examination, was refused acceptance on the ground that, to the makers, it was not worth the express charge of 50 cents! A manufacturing price of less than 50 cents and a "reduced" selling price of $5 appears to leave a comfortable margin for profit and advertising charges!

It may not be superfluous to add that any chemist of reasonable ability can easily analyze any of these patent medicines, in spite of the hoary legend that "organic mixtures defy analysis."

The fourth class of medicines comprises the "ethical" preparations. These substances are made under a varying degree of secrecy and are owned by the producing firms. In order to be "ethical" a substance must be advertised only in the medical journals, many of which are owned by the proprietors of the remedies in question!

Under these circumstances it is easy to understand how the most extravagant claims have been made, especially for some of the new artificial, synthetic

medicines. Often these claims are supported by statements of well-known German and French physicians, notwithstanding the fact that further investigation frequently shows the materials in question to have little or no therapeutic value. Indeed, at the present time, it may be stated with confidence that the standard of responsibility in such matters is far higher among reputable American physicians than among their European colleagues.

In order that the medical practitioner might be furnished with reliable information regarding these ethical remedies, the "Council on Pharmacy and Chemistry" was organized in 1905; its membership includes representatives of many of the leading medical schools and also some of the most eminent chemists in the country.

The results of the investigations of the council have been issued at intervals, in book form, under the title "New and Non-Official Remedies," and a report of its work has been published recently by Prof. J. H. Long, one of the members. On his report this article is largely based.

Space is not available for even a superficial review of the work of the council, but a brief account of two or three of its experiences may be interesting. One of the earliest subjects of its investigations was "headache cures." Many of these were found to contain large quantities of acetanilide; they were, of course, vended at prices enormously above their real market value, and were often paraded as being new and valuable synthetic discoveries. In some cases the advertisements contained warnings against the danger of acetanilide!

The preparations of lecithin, which have been lauded so highly, are not fraudulent, but, in the quantities used medicinally, they have no value as nerve or tissue builders, nor as stimulants in nutrition. An egg or two would undoubtedly be of greater value to the patient than several dollars' worth of lecithin. Similar considerations apply to predigested foods and malt extracts.

Cod liver oil enjoys a great reputation in cases of consumption and of malnutrition, tho probably its value is no greater than that of many other oils. An objection to its use is its unpleasant taste and odor, and consequently many mixtures of it with other substances have been marketed under the term "emulsion." One of the latest preparations to be placed on sale is "metabolized cod liver oil." The term "metabolism" is technically applied to the series of changes which food undergoes during its passage thru the body; therefore, if the oil were really "metabolized," it would necessarily have no food value, because it would be converted into carbon dioxide and water; in other words, a glass of plain soda water would actually represent metabolized oil!

As the result of the council's investigation and of a conference with the manufacturers of the oil, the following facts were established. The metabolized oil was prepared by mixing cod liver oil with a large quantity of water, to which was added hydrochloric acid, pepsin, sodium carbonate (washing soda) and finely divided pancreas. After being stirred for some time the mixture was filtered, the clear liquid colored and flavored with sherry wine, then bottled and sold.

It is difficult to exaggerate the absurdity of this process from a chemical standpoint. Pepsin, the chief ferment of the stomach, acts only in an acid medium, and, in any case, *has no action on fats or oils*. The ferment of the pancreas does decompose fats under certain conditions (which were not realized in the case in question) and acts only in an alkaline medium. Hydrochloric acid and washing soda neutralize each other and form salt. Consequently, under the conditions mentioned, there was nothing for the pepsin to do, and it could not act unless the acid were in excess. The pancreas could not act unless the carbonate were in excess! Finally, the filtration removed both of these materials and also *practically all of the oil*; consequently the "metabolized oil" consisted only of highly diluted sherry, together with salt and a little hydrochloric acid or washing soda, as the case might be!

As a final example may be mentioned an "intercellular ferment," which has also been largely sold to physicians, for use in cases of tuberculosis, diabetes and

malnutrition. It was claimed for this substance that it would pass thru the stomach, intestines and liver and be carried by the blood stream to the remoter tissues, where it would oxidize sugars with the liberation of heat and mechanical energy.

It is hardly necessary to say that the manufacturers never produced the slightest proof that the substance had any of the activities or properties claimed for it, and examination showed that the "ferment" consisted of milk curd mixed with living and dead bacteria and molds.

The examples given above will, perhaps, serve to indicate how great is the debt of the general practitioner—and thru him of the public—to the members of the council for their lavish and gratuitous expenditure of time, energy and skill in the exposure of these and many other frauds, for frauds they are, whether they arise from ignorance or from deliberate deception on the part of the manufacturer.

Let it be emphasized that the substances mentioned above—and also many others—are offered, not to an ignorant public, but primarily to physicians for the use of their patients. Aside from the work of the council, what chance has the ordinary general practitioner of learning the truth about them? Really none at all. It is the simple truth, and in no sense a reflection on him to say that he lacks the knowledge, the training, the time and the means for testing the real value of the numerous substances which are pressed upon his notice by clever salesmen.

TORONTO, CANADA.

The Well-Ordered Day

BY JOHN CLAIR MINOT

How shall the day be ordered? To the sage
The young man spoke. And this was his reply:

A morning prayer.
A moment with thy God who sends the dawn
Up from the east; to thank Him for the care
That kept thee thru the night; to give thy soul,
With faith serene, to His complete control;
To ask His guidance still along the way.
So starts the day.

A busy day.
Do with a will the task that lies before.
So much there is for every man to do,
And soon the night when man can work no more.
And none but he to life's behest is true
Who works with zeal, and pauses only when
He stretches forth his hand to help the men
Who fail or fall beside him on the way.
So runs the day.

A merry evening.
When toil is done, then banished be the care
That frets the soul. With loved ones by the hearth
The evening hour belongs to joy and mirth;
To lighter things that make life fresh and fair.
For honest work has earned its hour of play.
So ends the day.

BOSTON, MASS.

The Hours and the Man: A March Idyll

BY E. P. POWELL

Author of "The Country Home," Etc.

IT is curious how we are fitted together, we and the world. Our moods are wonderfully mated to the hours. Any one, in health, goes thru a whole gamut of emotions and sentiments between sunrise and sunset. No hour calls out the whole of a man; it only touches him at a single point. It takes twenty-four hours to do it, and every one with its own special demands and forces. Nor does any single day do it; nor any week, nor any month, for it takes a whole year to bring to a human being some degree of roundness in his joys, his wishes and his aspirations.

But no year does it, for each year finds a new sort of man, and it leaves him with new intentions and capacities. Are we sure that even one life will do it? I do not believe it; and I have so much faith in the Infinite Purpose that I feel sure human beings are not mere experiments, to be half finished and tossed aside. I believe God will somehow perfect Emerson; somehow, in one of those long days that takes in a million of our sun-made days. After all, what is a day, and what is an hour? Surely not the little snips of time that are counted by our solar system.

Morning cannot begin too quick for me. It is always delicious at daybreak in the country. Then, for the most part, it is cool and sweet with roses, and balsam from the pines, and just now with orange blossoms. What waves of fragrance roll thru the groves! Now I understand what the small winds that puff around our gardens are for—to pick up bouquets of sweet odors and distribute them to those who sleep or who work; to toss them into our windows all night—ozone, fresh brewed; that is, however, only as we ourselves co-operate. There are those who are so interpermeated with noxious odors that even the orange flower can make no impression on them; but for the most of us, to bathe in morning fragrance, and to let the bird notes create harmony in our souls, that begins the true work of the day.

One of the earlier callers, always in the morning, is the mourning dove. The call comes from a roost at the corner of the lake, in an orange grove. It is not quite cheerful, and yet not a sad cry. I think that the first aim of all bird songs has been to be heard, a matter of intercommunication. Music is an afterthought. The robin's note at daybreak is a "good morning" to any other robin toward the sleepy west. The mourning dove calls to some other family a mile away; after that comes the softening of the notes, the turning them under at the colons and semicolons. I remember also that human folk began with poetry, and invented prose at a much later period.

Bob White comes next. It is now the closed season, and the tourists can no longer hunt these beautiful creatures out of their hiding places. Bob certainly knows that he can at least be cheerful without danger. So he comes into my yard, and lets me know of his presence with a "White! White! Bob White!" To be sure, my beautiful fellow; bring your family all together here, and eat with my chickens. I despise a mere hunter, a killer, a sports-man. In all this beautiful world he sees only something to shoot, only also something to eat. He slies himself about my fences, and shoots over or across what his dogs have flushed. And those dogs! There is not a trace in them of that to-be-hoped-for human, that truth and honor that belongs to a collie. They are beasts, and I have no heart for either them or their master. Only here in my fort, and in the yards and gardens about me, Bob comes, lifting his beautiful head and moving his graceful breast without fear. There is not a better friend of the farmer in the world. He does not touch our vegetables or our grains, but he will eat even potato bugs.

The mockingbird is just now mating, and I have heard his wonderful songs

trilling and ringing and echoing all thru the peach garden. His love songs are mostly sung in the morning. He is not the very earliest, altho he often blabs a bit of Bobby Burns in the middle of the night, much as his cousin the catbird does in New York State. It is good dreams he has, for his night whistles are soft and conversational. His matin songs, however, are sufficiently saucy and full of pertness. I have one at the back door that comes down when he sees me, lights on a plum tree, and takes a bit of apple or a mulberry from my fingers. He looks me straight in the eye, without a quiver. He is not afraid of the right sort of person at all, but evidently has his own opinions as to different people. He does not know that his confidence is making character for me, but that is the best part of it, and it is the best part of everything that goes on about us.

To be sure! It is already daylight, and the Orpingtons, behind the barn, and the Rhode Island Reds, are talking about eggs, and are boasting of what they intend to do. If you want hens to lay abundantly, go to them occasionally and talk with them. They care as much for friendship as for food. I will let no one scare my friends in feathers. Give them names. See how "Whitey" will look sidewise at you, taking a few steps with yours; cocking her head and then softly answering your coo-coo—teaching you the Gallic tongue, which for all practical purposes is just as good as the Greek. I wish to converse with wise hens rather than with fools in borrowed feathers.

I am full of new-brewed life; but somehow it seems to me the world itself is also made over each night, and in the morning I breathe a more invigorating ozone. What a wonderful world it is. Sleep does what drugs cannot do, nor any magical skill of the medical profession. If one will live decently he shall sleep soundly, and then he shall be gladful at eighty. Come into my orchard with me and we will prune the superabundant boyhood of our young fruit trees. Peaches are already in bloom, and I note that the pink petals set around the stamens have a mission for us quite as good as the fruit itself. The boys are starting from the barn, to drive thru the pastures down to the Neighborhood Lakes, where the range cattle spend the night. They will come back by and by with a load of manure, to feed our sweet potato land. Felix shouts, "The top of the morning to you, father"; and I, to be sure, wish them the sweetness of the day in all its moods.

Be sympathetic with the young life about you; of that make sure. The birds do better than we, for one of the pair does the singing while the other is building. I believe that the secret which drives a large part of our boys from the farm is the desire to be gentlemen. This is a legitimate wish, and there is real achievement when, as a dry goods clerk, one of them stands behind the counter of shoes or blankets and politely waits on every customer. The real clerk has educated himself on a line of inherent worth. He has learned self-control in speech, and the grace of language. It will not do to sneer at the clerk. But these boy brothers of mine, they shall never need to become clerks. I will see to that. We will not leave out the song, neither will we leave out the fun.

I really do not think there is any other complete ration for making a successful farmer but fun. If you cannot get fun out of your work you will not love work, and you will not do enough work to win the day. Money cannot take the place of joy, and it cannot give the necessary delight. Fun must be located squarely in the doing, in the getting something done. I watched Prof. L. H. Bailey one day, while he was lecturing, and he said, "I'd do it anyway for the pleasure of it." Of our best workers you will find that they are tough to endure because they get the fun of it. What our schoolboys are left to get from a ball game I will try to inject into our daily life. They should grow up to know that there is fun in creating something new, and there is fun also in making folks happy. That was what Paul meant when he said "Rejoice, and again I say rejoice."

The sun rises, a clean crimson ball; over an orange grove, only nearer, there is a canopy made of huge pines. It is a grand sight, as it rises thru the branches, and—but look to the west! Over the lake the morning mist is broken into millions of prisms and there are everywhere bits of rainbows, flitting and

breaking, or blushing on the cheek of a mist cloud. Gladys has taken her oars, and crossed the lake to find us. It is a welcome change from housework, this half hour rowing thru the rainbows. She calls to us that breakfast is ready. This is the most perfect hour of the day.

Or is that most perfect when at twelve o'clock the horse goes into her stall to dine, after turning the furrows for the planters, and the laughing workers gently rub her down, themselves washing at the pump and gathering at the dinner table? Now the outer world knows that it also must meet and mate with the inner world, and the mother soul becomes dominant. I think I know why Theodore Parker, when he repeated the Lord's Prayer, used to say, "Our Father which art in heaven—yes and our Mother too." The masculine without the feminine will forever remain imperfect. Yes, little mothers, everywhere, it is true that we need you. We need more of the smoothing irons; the plow and pitchfork cannot do it all.

After dinner the boys fling themselves down under the mulberry trees; eating from the overhanging limbs, or talking of their plans, with occasionally a bantering joke. The sun at noon is not the same sun that rises under the pines in the morning, nor are we at all the same beings that faced the morn full-fronted. As for myself, I go to my veranda; not a pinched affair, but ten feet wide and reaching half-way around the house. My collies stretch out at my feet, and looking up lovingly seem to say, "It is all the same to the whole of us, we need sleep." Dear Walter Scott and dear John Brown! I love you because dogs loved you. I cannot trust one whom the collies distrust.

Yes, we all need rest, and we are all taking it. I do not find it in the Ten Commandments that we shall rest at noon, or after our meals; all the same it is a law of Nature. Nothing is made by too much driving, and you cannot well do two things at the same time. Our Anglo-Saxon stock runs too fast and jumps too far. We overlook the every-day peace and the comfort of little things. I am learning a good deal from the darkies hereabouts. Their philosophy of life is not so very far from being correct. Enough is enough; that is good Bible doctrine. It is rest that is sacred—not the day; for it is rest that gives us life. No matter how well we may have been created; it is the recreation that we must look out for.

About three o'clock in the afternoon the mood of the day is once more changed. The heat moderates, and the social hour begins. This is the time for exchanging calls, a curious kind of swapping—and whether it is conventional or not, I think it a part of Nature. The labor sentiment goes out of the atmosphere, and the strolling sentiment takes its place and rules from now till sunset. Mr. and Mrs. Budgen, a happy old couple, have hitched at the gate; and at the same moment it happens that thru the orange grove are strolling the Jacksons. We shall throw aside digging with mind or with body, and exchange the thoughts and feelings of the day. A bit of gossip, the earliest of all newspapers, will be welcome, and we shall sympathize more or less with all the troubles of our neighbors.

The sun rays are growing steadily longer, and each hour softens the heat. It is delicious to take in big drafts that come in over the lake. We get into big veranda chairs, and why not, why shall we not enjoy ourselves? The ducks on the lake begin the afternoon games, and the mockingbirds whistle every imaginable jumble of tunes. The cardinal bird flashes thru the pines with his brilliant scarlet; then sits on a handy limb, to rival the red-winged blackbird's silvery chorus.

At five o'clock I am still on my veranda with my coat off, and taking notes for THE INDEPENDENT. By good rights perhaps I should be watching the snowflakes, as they come scuttling down thru the frosted air. But not one have I seen all winter, nor have I heard the cry of the coasters, rushing down the hill. Three times the frost came, just enough to whiten the brown lush of the meadows; but the oranges hung unharmed, and the roses smiled at sunrise. So December went with chill enough for the fireplace at night; but January was more gentle than a Northern June, while February was undemonstrative, as so small a month should be.

The sun has nearly finished its work. It throws a crimson kiss to me across Lake Lucy; wonderful fingers of glory that touch the shore not far from my feet. Two of my boys are out there in a boat, and the blazon of Nature's love illuminates them like angels. God help you, boys, to see and hear some of the beautiful things there are in this world. God keep you from the grumbling and the growling, and from that sightseeing which finds only the troublesome and the mean. Take my word for it that God has never pronounced the world sinful nor the love of it sinful, and you need not do so ahead of the Allseeing.

Some one, since I wrote a previous idyll, sent me a circular absolutely demonstrating the non-existence of a God. Oh, well; I do not care; because if it were a demonstration I should know better. Such things never bother me. I just follow my instincts. Somewhere back of logic lies love; and where there is the boy there must also be the Father. If ever there was a fine thing said it was by the beautiful Jesus, "I and the Father are one." If you put out Him you put out yourself.

Night in the Florida orange openings is an affair almost altogether private. The heavens are lit up for us alone. Somewhere there may be other moons and moonlit valleys where thousands participate, but here it is our own lake and our own pine grove, and our orange orchard, and around it all and over it all the night canopy is also our own. Why not? There are but five or ten to the square mile, and we soon get the Cracker spirit of commonalty. New York City is a huge ant nest, where every one gets but a bite of things earthly or heavenly. All struggle; some starve. As for the moon and the stars there is only a glimpse apiece, but the sun scorches all alike, while smoke and evil odors are enough for every one.

Our night is a moving show, where worlds are on exhibition, and where the moon has no finer purpose than to light us, as on horseback we follow the trails thru the forest. This grand exhibition of the all-wrapping Infinite compels us to high thoughts and hopes that make us tremble. Near and friendly, the stars repeat themselves in the lake while we between the two empyreans sing, "Home, Sweet Home." I have no complaints to make of the world. I am not praying for a celestial city. I do not desire anything of the kind. When I move on I only wish to have my capacity enlarged for apprehending enlarged environment.

A ridiculous thing is our going to bed. There is so much expense and fuss about it, before we lie down to coax sweet ununconsciousness; that marvelous state where "Sleep, death's twin brother, times my breath." It is a wonderful world, where wonderful things are done, and nobody knows much how it comes about. Only this—we are living double lives all of us; and both are real. Claverhouse could devise no torture for the Covenanters like keeping them awake. Dreamland shuts us away from much of the beautiful, but it gives full compensation. It gives poetry to the prosaic, and joy to the troubled. There is no art compared with its music, and there are no friendships like those in our dream hours.

Only it is this, that in going to bed we are too much trouble to ourselves; and is it not so at all times? And from what I hear we intend to be a great bother to the angels by and by. Why should we not sleep as the soldiers sleep, or at least out of doors? It is the house that kills ninety per cent. of all that leave us. Houses should be only retreats and covers from storms. As for winter, which lets loose the grippes and catarrhs, and beats us to death with zero, I see no way but to run for our lives. There is no virtue in wasting our summers on our winters; making no gain of vitality. Nature sent the robins to teach us a lesson better than Shakespeare. Fly off for Florida, or, if easier, for California.

There are no village clocks hereabouts to call out the midnight hour, but being made up of habits, I waken at that time. Thru the window I see that the fireflies are still courting the tree tops, and the frogs have a drowsy humdrum about the lake. The crickets grind on like belated travelers in a city street. Suddenly in the oak brush by Lake Emerson, a fox snaps thru the silence with a sharp bark. My collies stand up warmly to the challenge, and warningly. A mockingbird is wakened in the persimmon tree; talks to himself a moment, and then drops back

into the silent world. But man the world has absolutely forgotten. I prefer sleep because nothing is quite real, and reason at such a time is intrusive. The broken facets of a dozen dreams in my brain make the world weird.

Hearing me astir the gentle voice of Harry comes thru the sweet pinewood, "Are you sleeping, my Father?" And I reply, "All is well, brother mine." So it is that the middle of the night is not empty, but is full of love; and the Great Life, he is not asleep. I like young life about me, and to be one of it. It seems to be part of religion, just as looking upward to the Father is religion. Life is not long enough to be divided between the old and the young. Growing old is a careless blunder. Live temperately and you may live almost as long as you please.

So has a day gone over me; and each of its moods has made a mood of mine. There are six of these days in a week, and then there is one of rest. Just six times as much religion in going into a plow field as going into church—altho both may be essential. If you cannot hear God where the cotton or the corn grows, you cannot hear Him where the preacher preaches. Only one thing Nature detests, and that is idleness. Make the best of them and the days will not bring out of us nor will they put into us too much of the harvest of duty and love and honor and temperate self-control.

And the weeks are at the same work, bringing you and me to a state of highest efficiency. To save a lout for paradise does not seem so great a matter, but to turn a lout into a son of God is worth the while. The sun may well rise and set, the blue canopy of the stars, the morning shout for joy if only we may, day by day, see Him more clearly "Who worketh hitherto," and who always will work. The real ambition of man is to so weave the hours into character, and the days and the years, that he shall be worth the while to the Divine Purposing that weaves roses out of common carbon, and makes angels of common folk.

SORRENTO, FLA.

"Forsan et Haec"

BY FLORA WARREN SMITH

OFT in my schooldays I've stumbled o'er many a bit of learning;
Slid thru many a weary lesson that now has vanished;
Once in a while a phrase, learned long ago, is returning,
Out of the dusty limbo to which so many are banished;
Here is one memory holds, nor would I consent to rob it;
"Forsan et hæc olim meminisse juvabit."

"Even these woes, perchance"—good old Pius Æneas!
"Even these woes, some day, will amuse us in the recalling."
Today we slip on the ice, and the small boy chortles to see us;
Tomorrow we're able to grin at the thought of our own clumsy sprawling;
When you are "down and out" say this, tho even you sob it:
"Forsan et hæc olim meminisse juvabit."

Life brings us many a gift, and some are good, and some bad ones;
Some are bitter as aloes, and some are sweeter than honey;
The fault is ours, no less, if we join the plaints of the sad ones.
Time tells which ills bring us good, and which turn out to be funny.
Time has his own little joke, and this of all sting can rob it:
"Forsan et hæc olim meminisse juvabit."

DENVER, COL.

LITERATURE

Goldwin Smith's Reminiscences

GOLDWIN SMITH had a distinction rare with educated Englishmen, and especially rare with Englishmen of the leisured class. He may be said to have been of England, of the United States, and of Canada; and in each country among admirers of his political ideals, and among those who read eagerly whatever he wrote without considering themselves as of his admirers, there must be a feeling of congratulation that there has been no long interval between his death and the publication of his *Reminiscences.** It was 1869 before Goldwin Smith left England to make his home first at Ithaca, where he was a professor at Cornell, and, after 1871, at Toronto, where he lived continuously until his death in June, 1910. Altho his stay in Ithaca did not extend over two years, it was, as the *Reminiscences* show, one of the pleasantest of Goldwin Smith's varied experiences; and as his will adequately proves, he never lost his warm interest in Cornell. Nearly half of Goldwin Smith's long, quietly active and eminently serviceable life was spent in the Dominion of Canada. He was of independent means, without the necessity of following any career for a livelihood, and altho he associated himself with many of the public or semi-public activities of Toronto and of Ontario, and was from the first a keenly interested onlooker at Canadian politics, few of his old neighbors in Toronto are likely to claim that he ever became a Canadian in the ordinary acceptance of the term. His freedom from the need of identifying himself with the business or professional activities of Toronto and thus really becoming of the Canadian people, tended in some degree to his detachment. He was an Englishman to the last, as would have been most educated Englishmen settled in Toronto under conditions like those of Goldwin Smith. He looked at political life in the Dominion from an English standpoint. He was disposed to gauge Canadian politics by English standards. Hence his disappointment with Canadian politics from 1871 to 1909; and to the last, he seems to have been more interested in what was doing in England than in the political life of the Dominion.

Many of the men sufficiently famous in English political life to have biographies written of them were at Eton. It is doubtful, however, whether in the whole range of English nineteenth century biography there is a better or more sympathetic picture of life at the famous school—of masters and pupils—than that which Goldwin Smith has left us in his *Reminiscences.* Equally interesting are the descriptions of life as a student at Magdalen College, Oxford; for Goldwin Smith's student days were of the years that immediately preceded the reforms at Oxford in bringing about which Goldwin Smith had a part as assistant secretary of the Oxford Commission of 1854-58. There was much opposition to the appointment of the commission, and to the reforms it was intended that it should make. Gladstone, who was then not yet a Liberal, denounced the proposed commission as an interference with private foundations; and there were, as is always the case in England when reform is proposed, dire forebodings of the ruin that was impending for the two old universities. But the commissions—one for Oxford and one for Cambridge—went ahead with their work. And Parliament sanctioned the reforms they proposed.

Goldwin Smith's connection with this Oxford Commission of 1854-58 and the acquaintances he had made at Eton and Oxford, served to introduce him to public life in England. He could have been of the House of Commons. A safe seat was put within his reach. He was also

*REMINISCENCES. *By Goldwin Smith, D.C.L.*, Edited by Arnold Haultain. New York: The Macmillan Company. Pp. xv, 477. $3.

admitted to the bar; but he never practised for the same reason that he did not avail himself of the opportunity of being of the House of Commons. His health was not equal to the strain of active political life or of life at the bar; and the only permanent position he held in England was that of Regius Professor of History at Oxford. From the end of his undergraduate years until he went to Cornell in 1869 he was much in contact with the statesmen and politicians of the mid-Victorian period; and from the point of view of English political history in the nineteenth century the most valuable chapters in the *Reminiscences* are those which are concerned with the Peelite party and with the Manchester School of Radicalism.

Like most Liberals of the Manchester school, Goldwin Smith's sympathies were strongly with the North during the Civil War. In recalling the division in public opinion in England at that time, he affirms that the success of American democracy had always been a threat to aristocracy in England. Secession was taken to be the death knell of the American Republic; and "the aristocratic and wealthy classes in England, generally exulting in the downfall of democracy, at once embraced the side of the South." Goldwin Smith was in Washington during the war; and his contrast of the original aim and purpose of the Republican party with the mission of the Republican party of the first decade of the twentieth century will be as little appreciated among Republicans as Canadians are likely in general to appreciate his characterizations of the politicians who have been dominant at Ottawa since Confederation in 1867.

Mr. Haultain, who has edited the *Reminiscences,* apologizes for his footnotes. Footnotes in a book that is sure to be widely read in three countries are commendable. It would be well if editors of English biographies would follow the same plan. The only trouble with Mr. Haultain's scheme is that it was not uniformly and consistently carried out; for there are many allusions in the text to English and Canadian matters to which no footnote is appended. A fair example of this neglect is the caustic reference by Goldwin Smith to the Haman's Gallows episode in the tariff history of Canada. The Toronto stove manufacturer's outbreak against the United States, at the annual convention of the Canadian Manufacturers' Association in 1907, then secured for him a notoriety which by this time must have become a little burdensome to him. But there is no explanation of it all, and for American and English readers a footnote here was more necessary than at some places where ample notes are appended.

Socialism and Success

In this case, as in many others, the choice of a title was evidently prompted by mere love of alliteration; for this book* is not an essay on how to achieve success thru Socialism; it advances the contention that since the individual's chances of advancement and success under our present system are very slim, we should try the Socialist system. The book is extremely well written, and in spite of a certain monotony very interesting. The monotony is due to the fact that Mr. Ghent formulates the same message four times under four different forms as befits the four different types he addresses: Seekers of Success, Reformers, Retainers, John Smith, workingman.

His message can be well summed up in the following paragraph:

"Of the 1,458,244 employees in the United States (1908) how many can hope ever to be numbered among the 5,767 general officers? You are an employee, we shall say; and in mere numbers you have about one chance in 252 of reaching your goal. No matter how efficient you become, no matter what hours you give to study and plan and fit yourself for "higher" things, it is not likely that the number of general officers will be greatly increased. If you and all of your fellows became the executive equals of the 5,767 general officers, there would still be places for only one in 252 of you. Then, too, probably only about one-half of the general staff come up from the ranks; the other half coming from the sons and nephews and retainers of rich and influential men—and so your numerical chances are really not more than one in 500. In the meantime the consolidation of large businesses is throwing more and more men out of their positions."

Reform work, active as it may have been, has brought very little relief;

*Socialism and Success, Some Uninvited Messages. *By W. J. Ghent.* New York: John Lane Company. $1.

things seem to be getting worse: while the increase in wages from 1890 to 1907 has been 21.2 per cent., the price of foodstuffs from June 1, 1901, to December 11, 1909, has been 23 per cent. Casualties among railroad employees have increased from 1 killed in every 433 and 1 wounded in every 31 in 1895, to 1 killed in every 393 and 1 wounded in every 17 in 1906-1908.

In thirty years insanity has increased 300 per cent.; the number of women in industry has increased 105 per cent. The number of suicides from 1885 to 1903 has increased more than five times as fast as the population.

The only remedy Mr. Ghent sees for all those evils of the present day is Socialism. Fraud, graft and oppression would disappear from the world for the reason that they would not benefit anybody.

"We can hardly suppose that under such circumstances there will be any production of fraudulent commodities for themselves. We can hardly suppose that people will deliberately set themselves to dangerous tasks when those tasks can be made safe, or to disagreeable tasks that can be made agreeable, or to monotonous tasks the monotony of which can be relieved. Nor can we suppose that in a society where all are useful workers, a social stigma will attach to any kind of useful work."

If Socialists, however, wish to lead the world toward the new system of society that will insure every one a just remuneration for his services, they must avoid certain sins of attitude or language from which some members of the American party have not been exempt: party bigotry is one of them.

"You denounce the jingoism of a nation, but you exalt the jingoism of a party and a class. You ridicule the sentiment of party 'regularity' when it is held by Republicans and Democrats and Prohibitionists, but you make it an ethical standard for Socialists. You ridicule the rapt devotion of Mormons and Mohammedans and Christians to the literal reading of their holy books, and you give yourselves with a greater devotion to a belief in the inerrancy of the words of a German prophet whom you sparely, if ever, read."

Many American Socialists also evince scorn, felt or feigned, for the so-called intellectuals.

"You cannot deny that the blessedness of ignorance, the contempt of knowledge, has been elevated into a doctrine in the Socialist movement in America. It is a doctrine which at the present time probably does more harm to the Socialist movement than any other factor. It keeps from the ranks thousands of able men who might be of inestimable help. The communists and Socialists of Europe learned better in time. And the result is that today in Europe intelligent and able men are at the head of the Socialist movement."

The broad-minded conclusion of the book should be heeded by reformers of all parties and beliefs:

"Let us also be tolerant in our own ranks of that freedom of thought and of speech which we so insistently claim for ourselves against the ruling powers. Let us furthermore be careful about ascribing to capitalism such prevailing ethical standards as happen not to please us—standards which often have a life history contemporaneous with civilized man. Let us be equally careful not to ascribe to capitalism vices innate in human nature and from which mankind has never been free. An indictment is best drawn when most exact; and the capitalist system with its record of blood and oppression, has enough in its history to warrant conviction and the death sentence without swelling the indictment with unprovable charges."

What Diantha Did. By Charlotte Perkins Gilman. New York: Charlton Company. $1.

A statistical romance is a contradiction at the outset. Mrs. Gilman calls *What Diantha Did* a "novel." It is hardly that. A "chronicle" would describe it more nearly, as it gives the common happenings from day to day in a life of domestic service lived by one young woman. She is ambitious, she has executive ability of a high order. She determines to standardize and put on a strictly business basis the complicated affairs of housekeeping. We have tables and accounts, everything standing in the dry light of reason and of common sense. We feel as we do when moving. Our cherished possessions standing on the sidewalk waiting for the van—they do look so shabby out there in the sunlight, tho they were comely and respectable enough in their places in the curtained rooms behind us! *What Diantha Did* is a sensible book; it gives a new and deserved comprehension of the importance and complexity of housekeeping. There is an amusing chapter wherein Diantha tabulates the services of a daughter in her father's house, of a mother's ability as seamstress. The pages bristle with figures. We are almost per-

suaded that a cooking trust would remove most of the causes of domestic unhappiness. Not quite. Disagreeable things must be done by somebody, and peeling potatoes will be no pleasanter task in the rear of a municipal cookshop than in an ordinary kitchen. Chefs are notorious for short tempers, the heat of the range gets into their directions to their subordinates, and it is extremely doubtful whether making a scrubbing brush an official implement will smooth away all housekeeping difficulties and infelicities. It is easy to brush them aside in a romance, where all happenings bend to the will of their author. Yet we would not undervalue Mrs. Gilman's attempt to let some light in upon the distracting situation of woman in domestic work. It is needed there, if in any business in the world. Mrs. Gilman would make more converts if she could check her tendency to flippant sarcasm, which at times conceals her real earnestness and kindness of heart.

Two Russian Reformers: Ivan Turgenev, Leo Tolstoy. By J. A. T. Lloyd. 333 pp. New York: John Lane Company. $3.50.

Essays on Russian Novelists. By William Lyon Phelps. New York: The Macmillan Co. $1.25.

Crime and Punishment. By Fedor Dostoievsky. With an Introductin by Laurence Irving. New York: E. P. Dutton & Co. 35 cents.

There is little about reform in Mr. Lloyd's book; it would have been difficult to convince us that Turgenev was a reformer, and Mr. Lloyd gave up the attempt; neither does he elucidate wherein Tolstoy's reformism consisted; but in both parts of the book (Turgenev taking up two-thirds of it) he gives us a psychological analysis of the great Russian's work which is subtle and illuminating. All of Turgenev's life was dominated by a pessimistic feeling of distrust of himself; the dryness of disillusions, the concrete recognition of imposture and self-imposture never allowed him to enjoy life frankly. His it was to experience every nuance of the promise and despair of passion, but somehow he never lost his prime freshness of insight. Nobody is more delicately and tenderly merciful when probing the depths of a troubled heart. In none of his works has he tried to advance any theories. His weak, irresolute, highly intellectual men, his earnest impassioned women, have no social message. In his private life Turgenev showed himself broadminded, generous to extravagance, deeply concerned over the comfort and mental advancement of the peasants, but never did he preach any economic gospel, and it was with genuine earnestness that on his death bed he begged Tolstoy to "return to art." Tolstoy's rugged oneness stands in sharp contrast with Turgenev's dual personality; for Tolstoy slowly evolved from worldly life into asceticism, from absolute art into sociology. Artist and reformer were never dissociated. It was not possible for Tolstoy to be contented with the ironical suspicion with which Turgenev viewed life and people. Nor could he accept civilization as at least a solace. He had to find out the meaning of life, he had to take refuge in a faith. But, Mr. Lloyd thinks, Tolstoy never gave up art, even in his "Confession":

> "Because Tolstoy remained a powerful artist, even in the very act of renouncing art he has given to his 'Confession' a far wider significance than that of individual conviction. It is not merely a human document of faith, but a work of art produced by a profound moralist who, from the very beginning, had brought intellectual truthfulness to bear upon his interpretation of life."

Of the other volumes whose titles are noted, Professor Phelps's is useful both from a literary and a bibliographical standpoint. He, too, writes of Turgenev and Tolstoy; also of Russian character in fiction, Gogol, Gorky, Chekhov, Artsybashev, Andreyev and Kuprin. His book is well-timed, covers more ground than is familiar to the casual reader of Russian fiction, is well informed and, in general, moderate in its conclusions. He devotes one chapter to Dostoyevsky, and quotes Stevenson's letter apropos of *Crime and Punishment:*

> "Many find it dull; Henry James could not finish it; all I can say is, it nearly finished me. It was like having an illness."

The novel makes its appearance in Everyman's Library: a series published for those who read the books they buy, and which, since a tremendous number of volumes are sold, must reach an equally

tremendous number of readers. The editor writes of *Crime and Punishment:*

"By its side the stories of Poe seem strained; Hoffmann sinks to the level of a self-conscious *poseur;* Bulwer Lytton glitters with the glitter of a 'skelt,' while Robert Louis Stevenson becomes but as a melting rushlight."

Literary Notes

....The address delivered by Henry Fairfield Osborn on *Huxley and Education* at the opening of Columbia University is printed by Scribner.

....Harold Bindloss in *Sydney Carteret, Rancher* (Stokes; $1.25) once more tells a tale of the Northwest. Outdoor adventure with enough of romance and finance to salt it down.

....Stanford Bennett's *Exercising in Bed* (Physical Culture Pub. Co., N. Y.; $1.50) gives directions for keeping the body in good condition by muscular movement and automassage.

....A new edition of *The Home*, by the brilliant editor and author of *The Forerunner* monthly, Mrs. Charlotte Perkins Gilman, has been published by the Charlton Co., 67 Wall street, New York, at $1.

....Dr. Charles E. Jefferson has put into his enthusiastic little booklet on *Congregationalism* (Pilgrim Press; 25 cents) an earnest plea for the study of history, religious and national, as a source of inspiration and future strength.

....Bergson's first great work, *Matter and Memory*, has just been published in English by Macmillan ($2.75). A special article will appear in THE INDEPENDENT shortly on the philosophy of Henri Bergson as presented in this and his other volumes.

....Dr. Lyman Abbott has brought together in a volume entitled *Seeking After God* (Crowell; $1) five addresses dealing with various phases of man's quest after the Infinite. They are all written in lucid style from the author's well known point of view.

....How long *The New Machiavelli* really was, the serial form of publication may have concealed for some readers. It comes out, however, when the book is published in its "second large edition" of 490 pages. (*The New Machiavelli*, by H. G. Wells; Duffield; $1.35.)

....The indefatigable Esther Singleton offers as her latest example of book-making, *The Children's City*—a guide, albeit informal, to the historical treasures and excursions of New York; aimed at Young Hopeful. Opening with a sketch of the Dutch period, and those which followed, it includes much useful information in compact form, and is illustrated. The familiar device of inventing children upon whom to string the facts and from whose mouths to catch pertinent questions is made use of. (Sturgis & Walton Co., $1.25.)

....For a lively and readable picture of northern Africa as it is today *The Land of the White Helmet* by E. A. Forbes (Revell; $1.50) is to be recommended. The author gives the best account of Liberia that we have seen anywhere and his observations on Moroccan conditions are valuable.

....The mind perplexed by contradictory religious claims will find it profitable to read Mr. George A. Andrews' inquiry into *What is Essential?* (Crowell; $1), which contains a solid and convincing presentation of the simple elements of creed, experience and activity necessary to a practical Christian life.

....Margaret Anglin will give a special performance in Boston, March 24, of "Hippolytus," a drama by the late Julia Ward Howe never before seen on the stage. The entire proceeds will be donated to the Howe memorial fund. "Hippolytus" was not even published during the lifetime of Mrs. Howe.

....That wild ducks can be reared like pheasants for profit and sport, and that it is practicable to establish small game preserves in almost any part of the country are only two out of many novel and interesting points brought out in *Our Wild Fowl and Waders* (Amateur Sportsman Co., 18 East Forty-second street, N. Y.). The author, Dwight W. Huntington, is an enthusiast on the subject of game conservation.

....It is not our custom to print the reviews sent to us by publishers with their books, but *El Porvenir de la América latina*, by Manuel Ugarte, we can introduce to our readers in no better way than by using the note supplied by the publishers, Sempere y Compañia, Valencia:

"*The Future of the Latin America* is a very interesting book in the present state of things and it is inspired by the events developed around the Canal of Panama. The oppositions and diffidences that the absorbent policy of United States raises in the republics of Spanish origin has given an opportunity to this book, where the author, the well-known Argentine writer, specificates the differences that exists between both Americas, and he proposes the alliance of the south countries against the great Republic of the North."

....Ernest A. Batchelder's notably practical and helpful series of articles on design which have been appearing in *The Craftsman* in recent years have now been gathered and amplified into a well made volume of nearly 300 pages, with the title, *Design in Theory and Practice* (Macmillan; $1.75). The author conducts us thru a series of problems leading from the simple, constructive use of lines and forms under clearly defined limitations to work involving considerable invention, fine feeling and freedom of execution. These problems begin

with the geometric and work toward nature; with the abstract, coming gradually into closer relation with the constructive questions discussed in the various chapters of the book, which, while intended primarily for teachers and students of design, is so interestingly written that any layman in search of right standards for intelligent and discriminating judgment in questions of design will find it both pleasant and profitable reading. Its many illustrations also are genuinely helpful.

....Instead of writing an appreciation of *Everyday Poems,* by Amos Russel Wells (Fleming H. Revell Co.; $1.25), let us merely remind our readers that the editor of the *Christian Endeavor World* originally contributed more than one of them to THE INDEPENDENT. The range of the present volume is wide, extending from poems that take root in Scripture to poems of the World Beautiful, poems of daily life, poems for children lovers, patriotic poems and humorous verses. Another contributor to THE INDEPENDENT who has gathered up a sheaf of verses is Emma Smuller Carter, whose book is entitled *Lays of the Lake,* and whose publisher is Mr. Wells's.

....Henry Bernstein's eighth play—his first, however, at this theater—has been withdrawn from the Théâtre Français after a few riotous performances. The riot was the work of the royalist organization, more royalist than the King, called the *Camelots du Roi.* Their leader, M. Léon Daudet, son of the great novelist, has fought a duel over the play with M. Georges Claretie, son of the director of the national theater. The provocation seems to be the fact that M. Bernstein is a Hebrew. But so have been a good many celebrated French dramatic writers and interpreters: Offenbach, Halévy, Rachel, Bernhardt—to go no further. The dramatist's Semiticism is aggravated, however, by the disclosure that he deserted from the French army shortly before the conclusion of his military service. The "camelots" would make it a second Dreyfus affair. M. Bernstein has explained, none the less, that the desertion was only part of a youthful love affair of which the passion was stronger than the wisdom. As for his play, which is lost sight of in the midst of all the surrounding circumstances, *Après moi* is, like some of his earlier plays, a fusion of the money and love interests. According to all accounts, its morality is none of the best, but it is less gratuitously brutal than the rest of his dramas. Le Bargy and Mlle. Bartet played the chief parts. Mlle. Provost was a bifurcated Duchess—the first ever hooted off the stage of the Français.

....Riots seem to be quite the proper adjuncts to first nights at continental playhouses. We have noted the excitement attendant upon the performance of Bernstein's *Après Moi. Vassa Yelesnovna,* a new play by Maxim Gorky, presented at Moscow, in spite of its richness in assassinations, poisonings, torture of children, forgeries, perjuries, and other crimes, was hissed to an untimely conclusion at the third curtain. The police were called in to clear the house.

Pebbles

FIGG—Don't you wish you could live your life over again?

Fogg—Well, I should say not! I've got a twenty year endowment policy maturing this month.—*Boston Transcript.*

FROM that excellent family journal, the Evanston *News,* we glean a want advertisement that carries this strong appeal:

"German Lady wants washing and cleaning. Mrs. ——, —— Maple avenue."—*Chicago Post.*

THE NEW YORK IDEA.

(Or is it "The Easiest Way"?)

The woman across the hall from us is dead.

"How did you find that out?"

"Why, I happened to see it in the paper."—*Life.*

WIFE—Darling I want a new gown.

Husband—But you had a new one only a short time ago.

Wife—Yes, but my friend Ellen is to be married, and I can't wear the same dress as I wore at her last wedding.—*Fliegende Blätter.*

"DID you ever," said one preacher to another, "stand at the door after your sermon and listen to what people said about it as they passed out?"

Replied he: "I did once"— pause and a sigh —"but I'll never do it again."—*Modern Eloquence.*

IT was the cub reporter's first assignment—the obituary of a prominent city man who had been fatally injured in an automobile accident. In his write-up he vividly described the tragic circumstance, referring to the bereavement sustained by the family. "The widow," he concluded, "is almost grief-stricken."—*Success.*

Harper's Monthly tells of a Paris laundress who "did" the wash of a celebrated journalist. Instead of keeping a notebook, this gentleman wears large white cuffs, and on these jots down memoranda; also suggestions for future articles. At first, the laundress was puzzled by his hieroglyphics. As time went on, she came to derive from them much benefit and entertainment. Finally, the newspaper man received with his week's wash a slip of paper on which was written this critical note, indicating what progress the lady had made, thanks to his cuffs:

"Your last washing was very interesting, but we should be glad to have you give us more political news."

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

President Taft and Secretary Ballinger

At last Secretary Ballinger has resigned and the President has accepted his resignation. The country is gratified that the change has come, and it has read with some surprise the letter of the President accepting it.

We do not say that Mr. Ballinger was an unfaithful official. His was the least happy of all the selections made by the President for his official family, and he was, and for good reasons, immediately under the watchful eye of suspicion. It is true that when an investigation was made of his official conduct, the majority of the committee found that there had nothing appeared in his official conduct that showed him to be other than "a competent and honorable gentleman, honestly and faithfully performing the duties of his high office, with an eye single to the public interests"; but a minority found sufficient to raise question whether, while no official act of his had been found corrupt, he had been ready to favor large financial interests in Alaska, but for the scrutiny with which he was followed, and he had not appeared to be in sympathy with the purposes of Mr. Roosevelt's administration to reserve the coal lands for the public benefit. He remained, as it seemed to us, reasonably under suspicion, and was not a factor to give strength to the President's Cabinet. We wish he had been relieved months ago, and he would have withdrawn but for the loyalty of the President, who stands fast by those in whom he believes. Now, at last, at the end of the session of Congress, he has insisted on his resignation and the President has accepted it.

We are not surprised at the warmth of the President's approval of Mr. Ballinger's conduct while in office. He accepts the resignation with "great reluctance," and gives the conduct of his office unqualified approval. One thing we admire in President Taft is the utter frankness with which he expresses his opinions, with no prudential reserve; and it is in accord with his character that, having found Secretary Ballinger a patriotic official, he is indignant with those who he thinks have traduced him. He says that Mr. Ballinger has been "the object of one of the most unscrupulous conspiracies for the defamation of character that history can show." We cannot see it so. It appears to us that the critics of Mr. Ballinger have been actuated by high motives in sole concern for the public welfare, and that they have done the public a service. We are not over-fond of the yellow, sensational, muckraking press, but the opposition to Mr. Ballinger has not come first from that source, and we have discovered no "malicious and unprincipled plan for the use of the press to misrepresent" his conduct or purpose as meant to serve certain large financial interests rather than the country.

It is very unfortunate for Mr. Ballinger that his conduct had given rise to suspicion; but it must be said in his favor that the President is right in declaring that no corrupt act has been proved against him. He has known how closely he would be watched, and he has not done ill. The rights of the public in the coal mines of Alaska have not been sacrificed. And the President has shown his own wise care by appointing as Mr. Ballinger's successor Mr. Walter L. Fisher, as good and true a man as could be found; one who has already proved

himself in hearty sympathy with the plans for the conservation of public utilities, which were a large part of the policy of the previous Administration.

Secretary Fisher has been very little of a politician. We seem to see of late years, with the extension of the civil service reform, and the passing away of the spoils system, a tendency to appoint to Cabinet and bureau positions men chosen for their peculiar fitness, and not for political purposes. Such a man is Mr. Fisher. Up to a late time it has seemed that while for the office of Secretary of the Treasury and that of Attorney-General special training has been sought, other offices have been purely political appointments, and are still to a great extent. When has a man been made Secretary of War or of the Navy because he was a specialist in military or naval affairs? Mr. Ballinger was made Secretary of the Interior because of his presumed familiarity with questions as to the public lands, and the same is true of Mr. Fisher. The Indian Bureau offers another example. After a generation in which politicians out of office were put at its head, President Roosevelt surprised the public by appointing an expert, Mr. Leupp, and then Commissioner Valentine was appointed by President Taft, promoted for efficiency. We are making progress. The reduction of the spoils allows and requires a better class of officials. The trend is upward. The reformers slowly get their innings.

The Congestion of Population

THERE could be no better proof that the time has come for a thoro inquiry into the extent, the causes and the effects of an excessive concentration of population in great cities than is offered in the reports of two important commissions, made public a few days ago. The New York State Commission on Distribution of Population has submitted its findings to the Governor and Legislature; and the New York City Commission on Congestion of Population has sent its conclusions to the Mayor and the Board of Aldermen. Taken together, these reports are an extraordinarily interesting account of existing conditions, and the recommendations that they make have a leaven of fearless and progressive thought in them that will produce a wholesome moral fermentation.

Some thousands of easy-going good people are morally sensitive enough to be disturbed, we trust, by the fact that our building laws permit the housing of at least 1,300 persons to the acre, which means that without illegal overcrowding the entire population of the United States could be congregated in Greater New York and leave room for the proper carrying on of our present business activities and a considerable future growth. It is not less disturbing in fact, altho it sounds less ugly when told, that the present congestion has come about thru apparently preventable causes, since it would be possible to house the population of New York, and its probable increase for many years to come, in one- and two-family houses and three-family tenements, within the existing boundaries of the city, and allow garden space to a large proportion of the families so provided for.

Among fourteen "main causes" of congestion enumerated by the New York City Commission, four may be singled out as pre-eminent. These are: (1) The planless way in which the city has been allowed to grow; (2) the unintelligent and irresponsible way in which the problem of transit has been handled; (3) our stupid and unjust system of taxation; and (4) the unrestricted increase of manufacturing occupations within the city limits.

To some extent the concentration of manufacturing, with its inevitable consequences of congestion of population, is attributable to the other three causes named. By heavily taxing improved land, and largely exempting from contribution to the public income lands withheld from use, a vast amount of industrial enterprise has been driven into central areas, and this unfortunate tendency has been strengthened by the impossibility of conveying a working population quickly between the central areas and the relatively undeveloped spaces. All these conditions, again, are largely consequences of our neglect to take up

seriously the systematic planning and scientific reconstruction of thorofares, industrial and commercial quarters, public buildings and residential districts.

It is impossible even to mention all the recommendations made by the commission, but three or four of them are radical enough to provoke active opposition, and to get desirable attention. First in order of importance among these is the recommendation of a tax upon unearned increments of land value. Such a tax is being put in operation in all parts of the civilized world, and in our judgment the time is near when public opinion in New York City will compel its adoption here. Second in importance we should place the sweeping rules suggested for the restriction of the hight of tenement houses and business buildings, and the requirement that a license be obtained before sub-leasing rooms to lodgers. Less drastic, but deserving serious consideration nevertheless, is the proposal that charitable institutions shall as far as possible be removed from congested areas, and that outdoor relief shall be given to the destitute on condition that they dwell in the more distant and less crowded areas.

The foregoing recommendations we consider as in reality more radical and potentially more effective than those pertaining to the transit situation, because the extension of transit facilities will proceed along lines determined by conditions which no public discussion of congestion will greatly influence. This is an unfortunate fact, but it has to be accepted.

We think that the city commission has erred in not basing a positive recommendation upon the European policy which is set forth, but is not made use of in the commission's report, of regulating the industrial evolution of large towns. Next to a just and expedient scheme of taxation, the most thorogoing way of dealing with congestion would be to forbid, unconditionally, all manufacturing operations in the central areas of large cities, and rigidly to restrict them elsewhere within municipal boundaries. This is the remedy that the civilized world will have to come to at no distant day. Manufacturing must be driven out to the open spaces, where the workers can live decent lives. It is not too soon to begin to force the idea upon public attention, or to discuss ways and means of putting it into effect.

Economy of National Resources

It is about two years now since we were told that American wastefulness had reduced our national resources so greatly that we must look forward to almost immediate bankruptcy. We were told that our forests, our mines and our soils were all giving out, and that by 1950 we should be close up to the last of our iron and our lumber supply, if not our fuel. We are glad to hear from the Academy of Sciences, the Presidential Address for 1910, a very careful *résumé* of the facts bearing on this statement, and a summing up of the data. It was not Mr. Carnegie alone, however, but high scientific authorities, such as the Geological Survey of Sweden, that announced for us a reserve of only one billion and sixty millions of tons of iron.

From the United States Geological Survey we now learn that we may count upon three and one-half billions of tons in the Lake Superior region alone. This is estimated as a fair reserve for a whole century. Mr. Carnegie's estimate uses up our supply in twenty years. Counting on an increased production and heavier drafts, there are still other resources, such the north shore of Cuba, where the soil is ferruginous; Newfoundland, where there is reported to be three billions of tons of red hematite; Brazil, that offers five to six billion tons of 50 per cent. ore. Going no farther, we see very clearly that our fright, while it has done a great deal of good in teaching economy of national resources, was without adequate cause.

Professor Kemp, whose estimates we are drawing upon, tells us that even were our actual ores exhausted, iron as a metal would not fail. The trap rock of our Palisades contains from 7 to 8 per cent. of metallic iron; so that we may say with him that iron can never fail. He assures us that it will not change in general relations to human

conditions for a very long while to come. As for coking coals, there may be more anxiety. Then comes the question, How long will our copper hold out? As it seldom appears in bedded deposits that can be easily measured, prediction in the case is less certain. In the deepest mines we cannot look ahead more than a year or two. But this we do know, that the relatively low grade ores of ten years ago have become the ores of today. Steam shovels are making excavations with great rapidity and at low cost where the ore lies near the surface. Some of the crushing mills take as much as eight or ten thousand tons in a day. On the other hand, copper does not oxidize as readily as iron, and for that reason the waste is very much slower. Taking things all in all, we cannot see any copper production fifty years from today. While the situation need not excite anxiety, it does teach the utmost economy.

The data given are quite as sharply instructive of economy in reference to lead and zinc. We have very few assured reserves, and the pinch of increasing cost is showing itself severely. These metals are, however, not as important to modern industrialism as copper and iron. As for copper, the lack of it would be found most serious in raising the expenses of service in electrical affairs. Wireless methods of transmission may, however, eliminate this metal. The copper wire of today may be displaced at any time unexpectedly, and other metals may displace copper as now used as a medium for expression in the higher crafts.

Silver will be very greatly affected by a decrease in the output of copper or lead; but silver resists chemical change, so that the world's stock is constantly increasing. No very important large proportion is permanently lost in the arts. As for coinage, we are assured that there will never be a lack of the precious metals; and beyond this they become, except in photography, matters of luxury rather than of necessity. Professor Kemp goes so far as to deny that gold and silver have any profound influence upon civilization, which we doubt that he can establish. But he is quite correct in saying that there is often more danger from a surplus than from a deficit of what we call the "precious metals."

The final dictum of our statisticians is not, however, different from that of Mr. Carnegie and Mr. Roosevelt. We have been very wasteful with our mines, as we have with our soils, and we must learn the full meaning of the words, conservation of national resources. We are already working over the rejected slags of old mines, and we shall be terribly inconvenienced by the increasing cost and scarcity of the metals. Valuable discoveries are very few now and disappointing. The State must hold on to its rights in mining property with tenacity. Meanwhile coal is surely being wasted beyond all possible excuse, if the supply were a thousand times as great. Our industries are based upon a free supply of the metals. Great changes in supply or cost would have startling effects upon social and industrial life.

The only consolation which we obtain is that naturally the American people is agricultural, and Nature has foreordained that agricultural resources need not be exhausted. In fact, the one great and most emphatic truth—we should rather say, discovery—of the present day is that soils can be increased from the air more rapidly than they can be used in the art of production. We must learn as a people to face toward land culture. Here lies the industrial prosperity as well as the moral and spiritual life of the people. The drift will be steadily toward an equalization of property holding, an equalization of social advantages, the elimination of extreme poverty as well as the elimination of extraordinary wealth.

On the whole we may say that our scientific friends are advising us not to let up on the Carnegie warning; to be conservative of our national resources, but at the same time to adjust ourselves easily to the usage of less wealth and the establishment of more comforts; that is, to become farmers in the scientific sense of the word, and be satisfied with simpler living. We are learning that the ruling of a great nation must be by the sustenance of rigid economy. National wealth is precisely like individual property, and demands the same conservation.

The Movement Toward Mexico

If we are to understand why more than one-fourth of the United States army has suddenly been placed at points near the Mexican border, accompanied by marines and powerful warships in the waters at each end of the boundary line, we should consider the situation in Mexico. While the insurrection which began in November last has not recently been growing, and has come to be regarded as a hopeless one, it is still subjecting important business interests to much loss. In many places the revolutionists are but little better than brigands. They have carried on their war mainly by making raids upon small towns, villages, ranches and mining camps, by robbing custom houses and post offices, and by burning railroad bridges. When confronted by a superior force they usually have gone back into the mountains. Their operations have been confined to a mountainous country lying near our southern boundary. By crippling the railways they have checked work in mines. From mining camps they have drawn workmen into their ranks by promises of riches hereafter, to be gained by a distribution of all the property in sight.

Their support has come largely from our side of the line, where they have procured their guns, their ammunition and much of their food. They have been encouraged and aided by juntas or revolutionary committees acting in San Antonio, El Paso, Los Angeles and other American cities. These committees have been recruiting agencies. In the revolutionist ranks there are many American adventurers. Without all this help from our border States the insurrection would have died out some time ago and probably could not have been started. The policing of the thinly settled, mountainous region near the boundary has been beyond the power of that portion of Mexico's small army which could be spared for such service, as a majority of the soldiers have been needed to preserve order in the south. The passage of arms and supplies across the boundary has not been prevented by the American troops placed at a few points on the long line.

American investments in Mexican mines, smelters, railroads, manufactures, etc., exceed $1,000,000,000. English and French investments are half as much more. Naturally, those who control this invested capital have complained, first to Mexico's Government, which has failed to give the desired protection; second, to their own governments abroad. Undoubtedly such complaint has been received at Washington from American companies. When called to account by Governments in Europe, Mexico has pointed to the United States, asserting that the rebellion was supported on our side of the line. Then these Governments have repeated that excuse in Washington, saying that we should no longer permit it to be used justly, and reminding us of our attitude with respect to the Monroe Doctrine. Probably they have said : "If you will not allow us to protect the property of our citizens in Mexico, then you yourselves ought to protect it. At least, you should prevent your own people from supporting the rebellion." That is not unreasonable. Insisting upon the enforcement of the Monroe Doctrine and forbidding the use of force by European Powers for the collection of debts and the redress of grievances in countries south of us, we have necessarily assumed duties and responsibilities which we must not ignore.

And so it came about that Mr. Taft sent the troops to Texas and Southern California, and the ships to adjacent waters. His first duty was to enforce the neutrality laws, to prevent the revolutionist guerrillas from getting supplies and support from our side of the boundary. This, we think, was his main purpose. He would make a wall thru or over which no supplies should pass, and would see whether the insurrection could live without such aid. He would also ascertain whether Mexico, this wall having been raised, could give adequate protection to foreign investments. Mexico asserts that under the improved conditions the work can be done.

For a long time everybody has been saying that anarchy or something like it would follow the death of Diaz. Mexico's President is far advanced in years,

and altho recent reports indicate that he is in good health, Mr. Taft may have had private information of a disquieting nature and may have thought that on this account it would be well to have a large military force near the border. If there should be a profound and general disturbance in Mexico, it would be his duty to bear in mind that great mass of foreigners' property. It deserves to be protected. Sometimes there are attempts to make people believe that it is all owned by a few greedy multimillionaires, or by "Wall Street." This is not true. The ownership of much of it is widely distributed.

We are sure that President Taft does not intend to invade Mexico, or to interfere with the action of its Government. He has taken the course which the situation required, and his purpose was a legitimate one. But why did he try to conceal or disguise it? That was an error. Why did he not say plainly at the beginning that his reasons were what we now know them to have been? Why did he, in an official statement, and his War Secretary and Chief of Staff, in explanations to the press, insist that the purpose was merely to practise maneuvers (for which no plan had been prepared), educate officers and test the power to mobilize quickly. By that shallow pretext there was nothing to be gained, but something to be lost.

While there is no room for doubt as to the friendliness of the attitude of the United States, there should be a warning for Mexico in this military movement. Europe asks for the protection of her material interests or investments in that country. Mexico must protect them, or, if unable to do so, must accept the aid of the United States. The giving of such aid would involve the presence of United States troops in Mexico. It would also involve expenses, which the American people would be unwilling to pay. Probably they would refuse to pay them. Mexico would find it necesary to satisfy the claim, a just one, with money or otherwise. We do not seek to acquire territory by force or in any other way unjustly. Mexico should make every posible effort to preserve order and to do its plain duty with respect to investments of foreign capital.

We doubt the expediency of the suspension, at the demand of President Diaz, of the constitutional guarantees designed for the reasonable protection of persons accused of certain offenses or crimes. This suspension, as we understand it, virtually permits the summary execution of nine-tenths of the revolutionists, if they can be taken into custody. There are not many of them who have not molested a railroad train, burned railroad bridges, or made raids upon villages or ranches. At all events, their captors could easily find them guilty of such acts. President Diaz's way of dealing with rebels is not approved by the civilized world. It would be much better to prepare and make known a plan of reform, to announce the Government's purpose to remove those evils of which Minister Limantour spoke in Paris two or three weeks ago, evils to the existence of which the insurrection was due. What Mexico should have is a larger measure of democratic government, greater freedom of political action, and provision for the distribution of a considerable part of the land now held in vast private estates. It might be more profitable to attempt to appease rebels by reform than to kill them without trial.

For the Children of Tomorrow

THE work of the New York Milk Committee, as an organization which, thru experiments, educational work and charities, endeavors to reduce the rate of infant mortality in New York City, deserves to be better known outside of that city's limits. One of its investigations shows that a large proportion of tenement dwellers are unable to pay the consumer's price for pure milk, and that the majority cannot buy modified milk for their babies. It is, on the other hand, demonstrated that clean milk, which is relatively cheap, rather than expensive modified milk, is needed for the reduction of infant mortality. More important, however, than any facts arrived at or made known thru the press are the principles of motherhood and the methods of caring for young children, especially during the summer months, as taught directly to the tenement dwellers

themselves. It is not as a charity that this particular organization has effected the greatest good, but rather thru its lectures, its demonstrations, its "follow up" system, as applied to mothers big and little, and its distributions of milk at cost.

There are some charities and some forms of social work for which it is difficult to arouse enthusiasm, for tho the work may be noble, it is difficult to regard it as essential to the common good. Whatever tends to give a fair chance to childhood, however, whatever helps to make healthy children instead of undertaking to correct perverted men and women, has enormous possibilities from every point of view, and makes an eloquent appeal to common sense. This is the ounce of prevention, not the pound of cure. That is why we hope that the New York Milk Committee will succeed in raising the $300,000 that it is after today, and why we hope to see its work imitated and improved upon in other of our cities whose size has made it necessary for us to find a substitute for the neighborhood spirit that was once adequate.

Bifurcation

Long after meteorologists are able to tell us what the weather will be this time next year and the seismologists to prophesy earthquakes and volcanic eruptions; long after we know the reason why the magnetic needle does not point to the pole, how the birds know when to migrate, and whither the corpuscles go when they cease to radiate; long after science has solved such problems as these, we may begin to look for some light upon the mysterious instinct which leads women to adopt and reject certain styles of dress. Until then men can only wonder and admire.

The object of our present wonder and, possibly, of our future admiration, is the harem skirt, which has made its appearance in the store windows and even upon the streets. This is essentially the same garment as was advocated and adopted in the United States by some of the leaders in the woman's rights movement fifty years ago. But the new style has one great advantage over the old, that is, its name. The ideal of womanhood prevailing in the circle which dictates fashion is much like that of the Orient, and garments which under the names of "bloomers," "rational dress," "divided skirt" and even "Syrian trousers" were received with derision, may find acceptance under the pseudonym of the "harem skirt." Advocacy of a costume on the ground of hygiene and convenience is worse than useless, but an announcement that the *jupe-pantalon* has been seen at the Auteuil racecourse is the most powerful argument it could have. If working girls had adopted it first it would have stood no chance of popular favor, but being taken up as a fad of the idle rich it may ultimately reach those who need it most.

There are two other indications of its ultimate success: The official organ of the Vatican has denounced it and the Illinois Legislature is considering a law to prohibit it. The Illinois bill, with unusual liberality, or rather equality of intolerance, prohibits both hobble and harem skirts. Many gentlemen who did not object to the women hobbling themselves are highly alarmed now that they show signs of freeing themselves, and these gentlemen are quite right, too, from their own standpoint. The competition of women in all fields of human endeavor is strong enough as it is, and there is no knowing what they might do if they were not hampered thruout life by their clothing. In the interests of masculine supremacy their handicap of costume must be maintained as long as possible.

The present day advocates of the extension of woman's sphere are, however, wiser than their grandmothers. They push only one reform at a time, taking up first something comparatively easy, like the attainment of the suffrage, and leaving difficult questions, like those of costume, to the future. To gain the suffrage they have only to convert the men. To alter styles they would have to convert their own sex. Suffrage speakers no longer appear upon the platform in short hair and bloomers. They wear all the hair they are entitled to or more, and their gowns are in the hight of fashion. The only woman who persists in wearing

trousers is Dr. Mary Walker, and she is an anti-suffragist.

Fifty years ago there was a spirit of individual enterprise in reformers which is now quite lost. If a man of that day did not believe in alcoholic liquors he just stopped drinking whisky, that's all. If he thought slavery wrong, he went down South and took some slaves to Canada. If a group of people were converted to socialism, they formed a colony and lived socialistically as long as they could stand it. If a person did not like the way words were spelled he spelled them to suit himself. Nowadays, instead of doing ourselves what we think ought to be done, we organize societies for the purpose of persuading or forcing other people to do it. This relieves the conscience of the reformer equally well, and involves little or no self sacrifice. A man or woman may entertain very radical views of almost any kind and still retain social standing, as long as no attempt is made to put them into practice, and this rarely happens.

Perhaps this change is due more to the strengthening of the forces of social control than to the weakening of personal courage. Fifty years ago the wife of a Baptist minister in New York could adopt bloomers and merely have to face local disapproval. Now the yellow journals would bring down upon her the scorn of a continent. Then a girl in the highest institution of learning open to women in this State could wear bloomers thruout her seminary course, and it was looked upon as only a minor eccentricity. What would the Vassar authorities do nowadays to a student who should adopt such a style, not with the sanction of Paris, but on her own individual initiative?

We would not have these casual remarks of ours taken as a prediction of the popularity of the harem skirt, still less as an argument in favor of it. We confess that such specimens as we have seen are quite distasteful to us. But, then, styles even more distasteful to us have, nevertheless, come into vogue, Fortunately, there is here no question of the adoption of masculine costume, nor will there be so long as women retain their superior taste and originality in matters of clothes.

Senator Root's Plurality Bill

We do not know whether Senator Root intends to bring up again in the extra session his bill for ending Senatorial election deadlocks by providing that a plurality shall elect whenever a majority for any person has not been shown on the March 1 immediately preceding the beginning of the term for which the election is held. It may be pointed out that if this bill had been a law when he introduced and supported it, Mr. Sheehan would have been elected a Senator from New York. At the beginning of a contest like the one in the Legislature at Albany, the machine organization, such as Charles F. Murphy's, usually has a plurality for its candidate. If Mr. Root's bill were a law, it would only be necessary for the machine to hold its plurality until March 1, for then its candidate would be elected, altho it would be possible in some cases for those opposing him to cause his defeat by voting with the members representing the other political party and electing their candidate. It seems to us that this is a formidable objection to the bill.

The Extra Session

It is the purpose of the Democratic majority in the House to pass the Canadian reciprocity bill at the extra session, and also to pass bills affecting three or four schedules of the tariff. In these revision bills they will attempt to reduce the duties on wool, woolen goods, cotton goods and foodstuffs. The reciprocity bill should be passed first and no tariff revision bill should be attached to it. It is known that the President thinks the tariff should not be touched (except by the reciprocity agreement) until the Tariff Board is ready to submit the results of its inquiries. This will be in December. But the Democrats care very little about the Tariff Board, and have given the important chairmanship of the Committee on Appropriations to Mr. Fitzgerald, who led the filibustering movement which prevented action, at the end of the recent session, on the bill making it a permanent body. If the House Democrats send to the Senate bills reducing duties on agricultural products mainly,

as appears to be their purpose, they cannot rely upon the support of the Republican insurgent Senators, and the bills will be rejected. These insurgents opposed the reciprocity agreement because it was confined almost wholly to agricultural products. They insisted that duties on manufactured goods should be reduced largely at the same time and reductions affecting only cotton and woolen clothing would not satisfy them. The country knows what the Democrats desire and intend to do, with respect to the tariff, and if general revision is to be postponed until the regular session it might be unwise to make a futile effort to revise two or three schedules in April or May. Business men, as a rule, would be pleased if the Democrats of the House should pass the reciprocity bill and stop there, deferring tariff revision until the session which will begin in December.

The Greek Sense

We said that the high school blunders that does not provide instruction in Greek. A college professor writes us that it is a pity we should teach such medieval notions, and that "our high schools in too many instances are wasting the public funds and the pupils' time and energy in teaching Latin and Greek," and he challenges us to justify our assertion. We are not clear that we need to; but we will say that we agree that it does not often pay for a youth in the high school to give his time to Greek if he does not intend to follow it up afterward. It is for the boys and girls who will study it and value it in college. And the value of it is not financial and directly practical, like bookkeeping or surveying, but is purely cultural, like English literature or botany. It gives an outlook. It makes it clear that all civilization has its source in Greek thought and art. The man who has not the feeling for Greece has not the sense of history, and that is worth having. The high school can give this somewhat thru English, by encouraging the brainy scholar to read Homer and the tragedies in a poetical translation, and Plato's "Apology" of Socrates and the "Creto," etc., in Jowett's translation. The trouble is that they will not do it, and it is only those who study Greek who get the width of vision—which our correspondent seems to include under "exploded notions of culture and formal discipline." Not quite exploded, Professor.

Associate Justice Hughes, and Lawrence Maxwell, Solicitor-General under President Cleveland, have accepted appointments on the commission to investigate second-class postage rates. These appointments show that the Administration has been actuated in this matter of second-class postage by no motives of revenge and retaliation, but by a genuine wish to correct possible abuses. We recall the fact that it is just two hundred years since Addison's *Spectator* made its first appearance. It ran its brief course only from March 1, 1711, to December 6, 1712, but is still read, we are informed, in institutions of learning and by old-fashioned bookworms. The reason alleged for its discontinuance by the distinguished editors, Addison and Steele, was that the imposition of a government tax on periodicals—a trifle of a half penny or so—made all the difference between profit and loss. No doubt all this history is known to Mr. Taft, and to Mr. Justice Hughes, who will take due warning.

It is a fine spirit which would preserve historical sites for the public. If Mount Vernon had been allowed to remain in private possession Washington's house would very likely have been torn down before this time. There is now a chance in the capital of this State to secure its most important historical house, the Schuyler mansion, as a State museum for historical and Revolutionary objects. It was built in 1762, and was the home of Gen. Philip Schuyler. There Washington was entertained; there Hamilton was married to Elizabeth Schuyler; there Benjamin Franklin, Charles Carroll, of Carrolton, Clinton, Lafayette, Steuben, Knox, St. Clair, John Jay, Chancellor Livingston and many others conferred with Schuyler on national affairs; and there the mark of the tomahawk is yet to be seen on the fine staircase. The Legislature should buy the place for $40,000, as recommended by eight different patriotic and historical societies.

Financial

The Monetary Commission

NEARLY three years have passed since the National Monetary Commission was created, but it has made no report. Our estimate of the value and probable achievements of this Commission has not been improved by the recent appointment of ex-Senator Flint and ex-Senator Taliaferro to fill vacancies. We are not aware that either has exhibited exceptional knowledge of finance. Nor was their fitness proved by their votes for Lorimer. But both have been set aside by their respective States, and a Commissioner's salary is $7,500 a year. Another new member is ex-Representative McLachlan, who lost his seat in the House. There are now in the Commission nine or ten men (a majority) whom their States or districts have withdrawn from Congress. Some of these ceased some time ago to attend the meetings. Two are residents of Colorado. But the salaries will be paid until the appearance of the final report. No one seems to know when that will be written.

Mr. Norton's New Place

CHARLES D. NORTON, who recently resigned as Secretary to President Taft, is to be vice-president of the First National Bank, in this city, succeeding Thomas W. Lamont, who withdrew from this great bank at the beginning of the year to become a partner in the firm of J. P. Morgan & Co. Mr. Lamont's predecessor in the bank had been Henry P. Davison, who also withdrew to enter the same firm. Mr. Norton, now forty-two years old, is a native of Massachusetts. Beginning to make his own living at the age of fourteen, he earned enough to pay his way thru Amherst College. Following his graduation (in 1893) he entered the service, in Milwaukee, of the Northwestern Mutual Life Insurance Company. Moving to Chicago, he became, a few years later, the company's general agent there, achieving notable success in the business which he had chosen. When only thirty-seven years old he was made president of the Merchants' Club. He became deeply interested in projects for municipal improvement, and especially in plans for beautifying the city, directing, as chairman of a committee, the publication (at a cost of $150,000) of a book which elaborately sets forth the plans which have been devised. Mr. MacVeagh induced him to become Assistant Secretary of the Treasury, and before he was

CHARLES D. NORTON.

invited to be the President's secretary he had enforced reasonable economies, which caused a saving of several hundred thousand dollars a year. He has been a tactful, popular, earnest and industrious public officer. The First National is one of the greatest of American banks. George F. Baker is chairman of the board, Francis L. Hine is president, and among the directors are J. Pierpont Morgan and James J. Hill. It has a capital of $10,000,000 and a surplus fund of $15,000,000. Its undivided profits are $5,738,320, its deposits $47,542,075, and its total resources $154,997,132.

The Independent

VOL. LXX NEW YORK, THURSDAY, MARCH 23, 1911 No. 3251

Survey of the World

Canals and Irrigation

Colonel Roosevelt pressed an electric button at Roosevelt, Ariz., March 18, and set in motion machinery which opened the Roosevelt storage dam, a part of the Salt River irrigation project, affecting 240,000 acres. This part of the Federal reclamation campaign was inaugurated under Colonel Roosevelt as President, the first stone of the dam being laid four and a half years ago. The construction involved building a desert and mountain road at a cost of $300,000. The main canals and the cross canals have a total length of many hundred miles. Some of them antedate the new construction, and certain ones are said to be the work of a prehistoric race of aborigines. The Roosevelt dam itself is 168 feet thick at its base and its top is crossed by a roadway 1,080 feet long and 16 feet wide. Its hight to the parapet wall is 280 feet. The spillway is 200 feet above the base. Below the dam is a water turbine power house and transformer capable of producing a 45,000 volt current. This will be carried across the desert to Vesa and Phenix. This power is expected to pay the cost of maintenance of the irrigation project.——Last month the excavation in the central division of the Panama Canal, including the great Culebra Cut and the Chagres section, was the greatest on record, being 1,409,338 cubic yards. In that division 71,833,522 yards have now been excavated, leaving 26,091,496 yards to be removed. In the Atlantic division the total excavation in February was 574,199 yards; in the Pacific division, 509,217 yards. Taking the canal as a whole, up to March 1 there had been taken out 131,829,436 yards, leaving 50,708,330 yards to be excavated. The canal at the Pacific entrance is completed from deep water to a point opposite the Panama Railroad wharf, at Balboa, a distance of about 5 miles. From this point inland the open water channel extends 3 miles, certain sections having their final width of 500 feet. At the Atlantic entrance the channel is completed to its full width. There remain to be taken out of this section 30,600,000 yards of earth, and 3,800,000 of rock. The earth excavation is 66 per cent., and the rock 59 per cent. completed. Excavation in the big Gatun lock is practically completed, and about 56 per cent. of the concrete is in place. The Gatun dam, the greatest in the world, is about 60 per cent. completed. The concrete work in the locks at Pedro Miguel is over 67 per cent. completed, and about 11 per cent. of the concrete is in place at the Miraflores locks. Bids for emergency dams to safeguard all of the permanent locks will be opened March 30.

Corruption

The Vermilion County, Ill., vote inquiry was ended March 14, after an eight weeks course, the grand jury being dismissed until April 17. Thirty-seven indictments were returned, of which only fourteen were for political offenses. All of the fourteen involved were mere precinct captains and their underlings, no leading politicians being indicted, and only one member of the Danville city election committee. Resolutions adopted by the jury will be sent to the Governor and to members of the State Assembly from the district, asking that a law be enacted to punish the first offense for purchasing votes by disenfranchisement for five years, the second offense by life disenfranchisement. Vermilion County offi-

cials were rapped for their failure to cooperate with the grand jury in its investigations, and Danville business men were charged with endeavoring to discourage the continuance of the election probe.——John J. Healy, former States Attorney of Cook County, has been asked by the Helm Bribery Investigation Committee to take charge of the investigation of alleged corruption in the last Illinois Legislature. This is the latest development in the concluding chapter of the Lorimer case and its ramifications.——Senator Bailey is angry at the issuance of a subpoena for him in connection with the proceedings against State Senator Holtslaw, of Illinois, and he will probably refuse to make any explanation of the disappearance in the Senate chamber at Washington of the affidavit of the bank clerk, Newton, and the Holtslaw bank deposit slip. "Of course," says the Texas Senator, "he [the State's Attorney of Sangamon County, Ill.] perfectly understood that Illinois could not issue a subpoena for persons outside of her jurisdiction, and therefore the application for it was a contemptible piece of petty politics."——Nine men, including A. C. Frost, former president of the Alaska Northern Railroad, and various bankers and brokers of Chicago and other cities, were indicted last week by the Federal Grand Jury at Chicago in the Matanuska River (Alaska) coal land cases. They are charged with conspiracy to defraud the Government of 10,000 acres of coal lands, valued at $10,000,000. The penalty provided is a fine of $10,000 or imprisonment for two years on all counts, and there are two counts in the indictment. The tracts involved are known as the Watson and Matanuska Coal Company groups. —— The contempt charges against George B. Cox, Republican boss of Cincinnati, were dismissed, March 15. The Baschang bribery case, of which the former was an outgrowth, remains unsettled.

From City and State

Iowa, Colorado and New York have failed to fill their Senatorial vacancies. In Iowa the Republican majority is split between Judge Deemer and Judge Kenyon.—— The Nevada Senate has passed the Assembly bill submitting the question of woman's suffrage to a vote of the people. ——The Socialist majority in the Milwaukee Common Council has secured the authorization of the purchase of three miles of river-front property on the Upper Milwaukee for park purposes. The Administration is, however, embarrassed by the defeat of the ordinance providing for a bond issue to cover the cost of $1,010,000. Before gaining control, the Socialists complained because the city did not find work for the unemployed. Now they are in their turn accused of failing to do more for the unemployed than the old parties did. It is said that there are 20,000 unemployed in Milwaukee.

Capital and Labor

The New York Central Railroad and the Pennsylvania Railroad companies were fined $35,000 and $20,000 respectively by Judge Hazel, of the United States District Court at Buffalo, March 15, after railroad attorneys had pleaded guilty to granting rebates to the Standard Oil Company, upon indictments in 1907.——The express strike in Jersey City, N. J., has become general thruout the metropolitan district of New York. The United States and Wells-Fargo companies are now affected as well as the Adams. Mayor Gaynor, who played a large part in adjusting the strike of last November, denounces the strikers for breach of faith and qualifies the present situation as "inexcusable, criminal and brutal." The Mayor was to have been the arbiter in the case of men whom the companies refused to take back because of alleged violence, but no such cases were brought before him. Last November his sympathies seemed to be with the strikers, but now he promises a delegation of the men who wish to remain at work that he will protect them; and policemen sit beside the express drivers. The president of the International Brotherhood of Teamsters has declared that there will be no general strike.——Nearly 5,000 coal miners in Eastern Ohio have been ordered to lay down their tools by the president of the United Mine Workers of America. This strike is called in sympathy with that which has prevailed in the Tuscarawas district of Ohio for almost a year.——The coro-

ner's jury in the case of the Los Angeles *Times* building explosion of October 1, 1910, after an adjournment of several weeks, held its concluding session March 15, and returned a verdict attributing the fatal disaster to "parties unknown."

The Military Movement Toward Mexico

No additional official explanation of the movement of troops to the Mexican border was given last week. Orders for maneuvers were issued. General Carter said a test of the new field service regulations was sought. He denied that the railroad companies had been asked to prepare for a sudden demand for transportation from San Antonio. Secretary Dickinson said:

"There could be no excuse for intervention unless the Mexican Government were negligent in protecting persons and property, and this would have to be firmly manifested before any such step could be taken. There are no conditions existing now that would warrant any such action on our part. In order to maintain the neutrality laws it was deemed advisable to send troops to the border."

In Cleveland, on the 15th, Senator Burton, of Ohio, who had just returned from Washington, gave the following remarks to the public:

"If the insurrectos capture the city of Chihuahua, the serious aspect of the trouble in Mexico will become apparent. In that case it is probable that the United States will intervene . . . The United States, if it intervenes, as now seems more than likely, will not seek the conquest of Mexico, but will aim to restore peace and to establish the government on a firm footing, and will then withdraw. The Mexican situation is grave, but the revolt is one which the United States can limit by interference at the proper time."

His statement was not, however, regarded as one representing the views and purpose of the Government. Much interest was excited by the statements given to the press by Señor Limantour, Mexico's Minister of Finance, and by his association in New York with the father and three brothers of Madero, the revolutionist leader. He was firmly convinced, he said, that but for the sympathy, financial support, and actual participation of Americans, the insurrection could not long continue. Moreover, except for the sensational articles printed in our newspapers and magazines for a year or more before the insurrection began, in his opinion there would have been no insurrection. He pointed to the acts of Oscar Creighton, the American leader of a band of men who have wrecked the railroad south of El Paso and Juarez, and thus crippled important industries supported by American capital. Such men, he said, could scarcely expect to be protected by the United States Government. The word intervention, he continued, had been used loosely. Intervention would involve invasion, and that would mean war. What had Mexico done to deserve a threat of war? He started for the Mexican capital on the 15th, going by way of Laredo. Altho there had been denials that his conferences with the Maderos related to negotiations for peace, there were indications that, as the Associated Press asserted, he bore with him a statement of the revolutionists' demands, and a plan of reform that might satisfy them. He was constantly in communication with the Mexican capital by telegraph, and reports from that city said that the President was considering reform projects, especially with respect to the government of States and the distribution of land. It was also reported that he would displace Señor Creel as Minister of Foreign Affairs, and that then the retirement of Vice-President Corral would place him in line for succession to the Presidency. His safe arrival at the capital was awaited with much interest. He has been the adviser of three generations of Maderos. The head of the family, now eighty-four years old, who has a fortune of $50,000,000, very recently sold his rubber plantations and factories for $15,000,000 to the Intercontinental Rubber Company, which is controlled by American capitalists. The brothers of the revolutionist leader regarded Señor Limantour's journey with some anxiety. One of them said it would be a mistake for the revolutionists to impede his passage, as he was a practical man whom his country needed. Mexico's vice-consul in New York said he was bearing to the capital "important plans for reform."——President Taft's action will be criticised at the approaching session of Congress by Senator La Follette and others. The Senator says in his magazine: "Is it possible that the army and the navy of the United States are being used as a side show for a gigantic Wall Street gamble?" He asks

other questions which touch upon an alleged interest of the President's brother Henry in corporations doing business in Mexico. It is said that President Diaz will now send more troops northward and make a supreme effort to stamp out the insurrection.——In dispatches from the Mexican capital, forwarded two days after Señor Limantour's departure from New York, it was said that President Diaz would not listen to any terms proposed by the revolutionists, if Señor Limantour should present them. The re-establishment of railroad communication with the city of Chihuahua, after it had been interrupted for ten days, had confirmed his opinion that the revolutionists were weak and were making r gains.

The Mexican Revolt

As had been foreseen, President Diaz's demand for a suspension of the constitutional guarantees with respect to persons guilty of raiding ranches and wrecking railroad or telegraph lines, was approved by the permanent Commission of Congress, and warnings were published. It was said that the revolutionists would retaliate and give no quarter. ——Creighton, the American leader of a band of wreckers, was in camp last week 15 miles south of Juarez. These men had torn up several miles of the railroad between that city and Chihuahua. Americans were taking command of other bands, and it was reported that Orozco had retired, saying that he would no longer stay with insurrectionists who had become robbers, assassins and assailants of women. These were the words used in a circular letter bearing his signature. —— The revolutionists' attack upon Agua Prieta, across the line from Douglas, Ariz., was a failure. They were repulsed, with the loss of several lives, and Blanco, their commander, was denounced by some of his subordinates. It now appears that young Garibaldi, grandson of the Italian liberator, was not killed in the battle of Casas Grandes. ——On the 17th, the railroad from Chihuahua southward to Torreon was opened again by the Government. Chihuahua had been isolated for ten days, and the inhabitants had suffered for lack of food.——Our Government asked for the release of Blatt and Converse, the two young Americans imprisoned at Juarez, asserting that they had been captured on American soil. Mexico denied this, and it is expected that the controversy will be referred to the Boundary Commission. Blatt's home is in Pittsburgh, and Congressman Porter, representing a Pittsburgh district, has been hard at work in his interest.——At the Pacific end of the boundary a party of revolutionists pillaged the small town of Tecate. Their leader was an escaped convict. They were surrounded by Government troops, who killed nearly all of them. A day later other revolutionists in that district captured and shot two Government spies. —— The American Smelting and Refining Company gave notice that all its smelters in the State of Chihuahua would be closed on the 20th, for lack of fuel and ore. Work has also been stopped in several coal mines, and thousands of employees are idle.—— Japan denies that she has made any secret treaty with Mexico. Sensational newspapers have published reports to the contrary.

South and Central America

There were two battles in Paraguay, last week, and in both the revolutionists were defeated. In the first, which took place near Limpio, one hundred of them were captured. In the second, at Villa Rosario, about two hundred revolutionists were killed, and many prisoners were taken. Among those who lost their lives was Dr. Riquelme, formerly Minister of the Interior in President Gondra's Cabinet. Gondra and Riquelme were leaders of the revolt, Gondra having been forced out of office by Colonel Jara, who proclaimed a dictatorship and who now, as Minister of War, commands the Government's army.——All opposition to the peace agreement in Honduras has been withdrawn. President Davila will retire upon the arrival of Dr. Beltran, the new Vice-President, at the capital. The agreement provides that there shall be an election in October. The expenses of both armies are to be paid by the Government, and soldiers of both armies are to be pensioned. Gen. Lee Christmas, the American soldier of fortune who commanded Bonilla's army, has been made Governor of the Province or Department of Cortes.——Manuel

Estrada Cabrera was inaugurated as President of Guatemala for the third time, on the 16th.——The Legislative Assembly of the Bahama Islands recently voted, 23 to 6, for the annexation of the islands to the Dominion of Canada. This action had been proposed in a large mass meeting in Nassau, at which several Canadians made addresses. The Governor of the Bahamas will ask the Canadian Government to provide for a conference.

Peace Talk in Parliament

A discussion of naval armament in the House of Commons elicited a declaration from the British Foreign Secretary which may lead to important results. A resolution protesting against the increase of expenditure for army and navy was presented by J. A. M. Macdonald, Liberal member for Falkirk Burghs, and amended by another Liberal, Joseph King, from North Somerset, expressing a desire for arbitration. The First Lord of the Admiralty, Reginald McKenna, in replying to their speeches said that it was impossible to reduce the naval estimate because Germany had increased her naval estimates for next year by an enormous sum, but he said that there would be no further increase of expenditure unless the German program should be changed. In 1914, he said, Germany would have twenty-one Dreadnoughts to England's thirty, no more than a safe margin. Foreign Secretary Sir Edward Grey, acting in the absence of Premier Asquith as Government leader, accepted the King amendment and spoke at length upon the anomalous and distressing situation prevailing at present, when the civilized Powers were assuming closer and more friendly relations and yet were engaged in a ruinous rivalry of expenditure in preparation for war. He continued:

"Unless the incongruity and mischief of all this be brought home not only to the heads of men generally but to their feelings as well, so that they resent the inconsistency and realize the danger of this tremendous expenditure, the rivalry will continue and it must in the long run break down civilization. You are having this great burden piled up in times of peace and if it goes on increasing by leaps and bounds as it has done in the last generation it will become intolerable. There are those who think that it will lead to war precisely because it is already becoming intolerable. I think it much more likely that the burden will be dissipated by an internal revolution, by a revolt of the masses of men against taxation."

Sir Edward explained that it was impossible for any one country to drop out of the competition and he saw no way of checking it except international arbitration. On this point his own words must be quoted in full:

"I should perhaps have thought it unprofitable to mention arbitration had it not been for the fact that twice within the last twelve months the President of the United States has sketched out a step in advance more momentous than any one thing that any statesman in his position has ventured to say before. His words are pregnant, with very far reaching consequences.

"Mr. Taft recently made the statement that he does not see personally any reason why matters of national honor should not be referred to a court of arbitration. He has also expressed the opinion that if the United States could negotiate a positive agreement with some other nation to abide by the adjudication of an international arbitral court on every question that could not be settled by negotiation, no matter what was involved, a long step forward would be taken.

"These are bold and courageous words. We have no proposal before us and unless public opinion rises to the height of discussing a proposal of that kind it cannot be carried out. But supposing two of the greatest nations of the world were to make it clear to the whole world by such an agreement that under no circumstances were they going to war again I venture to say that it would have a beneficent effect.

"The nations that made such an agreement might be exposed to attack from a third Power. This would probably lead to their following with an agreement to join each other in any case where one of them had a quarrel with a third nation which had refused to arbitrate.

"I do not think that a statement of this kind made by a man in Mr. Taft's position should go without response. In entering into an agreement of that kind there would be risks and you would have to be prepared for some sacrifice of national pride in such an agreement as that proposed by the United States.

"We should be delighted to receive such a proposal. I should feel it something so far reaching in its consequences that it required not only the signature of both Governments but the deliberately decided sanction of Parliament. That I believe would be obtained."

Reception of Peace Plan

It is rare that a Government utterance attracts more attention or is more favorably commented upon than Sir Edward Grey's exprest approval of the Taft proposal for unlimited arbitration. Mr. Balfour, as leader of the Opposition, pledged the hearty

support of the Unionists for the policy. He thought arbitration quite practicable between Great Britain and the United States. This would not, however, affect the naval estimates because Great Britain did not build ships with the idea of using them against the United States. Lord Chancellor Loreburn, speaking in the House of Lords, said that President Taft's proposals might prove to be the most important utterances of the century and a turning point in the history of the world. The leader of the Labor party in the House of Commons, J. R. Macdonald, exprest approval of the arbitration plan, but objected to what Sir Edward Grey said about the two nations acting together against a third which refused to arbitrate. If Europe got the idea that there was going to be an Anglo-Saxon alliance it would do more harm than good. Sir Edward Grey, in a speech at a dinner of the International Arbitration League, referred to this objection and explained that he meant merely that when two great nations were bound together by such an arbitration treaty it would develop such a feeling of sympathy between them that the public opinion of both would be strongly against a third nation refusing to arbitrate a dispute with either. He thought it unwise to introduce the question of a defensive alliance into a plan for arbitration, "but the thought of future possibilities is an encouragement which should not be grudged or denied."——The Nonconformists have entered upon an earnest campaign in favor of arbitration with the United States. Most of the papers of all parties, except the strongest of the imperialistic organs, speak cordially of Sir Edward Grey's remarks. Only the *Saturday Review,* always anti-American, says that "dithyrambic drivel about peace does nothing to accomplish it."——In Germany President Taft's proposal met with a cold reception, and, according to the German press, England takes to it only because she is afraid of losing Canada. The Socialists and other radical parties will introduce the following resolution into the Reichstag:

"In view of the fact that the French Chamber of Deputies and the British House of Commons have declared in favor of limitation of armaments the Reichstag hereby calls upon the Chancellor to take steps immediately to bring about an international understanding regarding a general reduction of armaments and the abolition of the right of capture at sea."

——In the Austrian Reichrath Minister of War Schoenaich said that history showed universal peace to be unattainable, and called attention to Great Britain's colossal naval program and the vigorous mobilization of America's fighting forces."——The Danish Foreign Office has notified the Peace Bureau at Berne that Denmark will accept the invitation of the American Government to appoint a commission to promote arbitration.——The plan recommended by Admiral Henderson for the construction of an Australian navy calls for the expenditure of $115,000,000 during twenty-two years in the building of a fleet of eight armored and ten protected cruisers, besides eighteen destroyers and twelve submarines.

The Bagdad Railroad

It is reported from Constantinople that the Bagdad railroad question has been settled by the Porte and that the work will now be pushed forward. The railroad will be carried across the Taurus range to El Helif and thence to Bagdad. A branch line will run to Alexandretta and another branch leaving the main line at Killis will connect at Aleppo with the Damascus Railroad. It is this Aleppo branch which is causing anxiety to England because it aimed directly at British control of Egypt. In Dr. Rohrbach's monograph on the Bagdad Railroad it is plainly stated that Egypt is the most vulnerable point of the British Empire, the only point where it can be attacked from Europe by land, and that this is the reason why Germany is interested in developing the railroad system of Asiatic Turkey. With a line running from Constantinople to the Egyptian frontier, Turkey might be inclined to attempt the recovery of Egypt, and if this were accomplished, perhaps with the help of Germany and of a rising of the Egyptian Nationalists, England would lose control of the route to India and very likely have to face a Mohammedan insurrection there. The Turkish Government seems to be as completely under German influence as ever was Sultan Abdul Hamid. An American, Dr. Chester, proposed a system of railroads connecting the Black

Sea with the Mediterranean at Alexandretta and valley of the Upper Euphrates with that of the Tigris; and French and English capitalists have offered to construct a similar system, all without asking any guarantees or aid from the Turkish Government, but all these offers have been refused in favor of the German, which receives support from the Turkish treasury. The Grand Vizier, in defending his course in Parliament, said that there was no loss to the Government thru the guarantees, for the receipts from provincial taxation had increased 45 per cent., thanks to improved communications, during the reign of Sultan Abdul Aziz. The question of the extension of the railroad beyond Bagdad is still open, as the German construction company has renounced any claim to Koweit, accepting Alexandretta in compensation. The Russian Government has agreed with Germany to allow it to connect at Khamikin, on the Persian frontier near Kermanshah, with the railroad which Russia proposes to build thru Northern Persia to India, but it is uncertain when this road will be built, and this would divert the Bagdad Railroad from its real aim, the head of the Persian Gulf. Here England holds the key, for it claims a protectorate over Koweit. It has recently transpired that the legal ground of this is a secret treaty which was concluded January 23, 1899, between Colonel Meade, British resident in the Persian Gulf, and Sheik Mubarak, of Koweit, the provisions of which have never been made public. It has been semi-officially stated, however, by the British Government that the Sheik in return for definite considerations placed his rights and interest under special protection of Great Britain and agreed not to cede any portion of his territory to any foreign Power. Because of this Sheik Mubarak refused to lease a site of 20 square miles at the head of the bay when early in 1900 Herr Stemrich, German Consul-General at Constantinople, came overland to Koweit to secure a terminal for the Bagdad Railroad. The Sheik of Koweit still flies the Turkish flag over his palace and his shipping, but in 1901, when a Turkish corvette packed with troops entered the harbor and attempted to take possession of the town, Captain Pears, in command of a British cruiser, forced its withdrawal. And later, when Koweit was threatened by a force of Arabs from the interior, British bluejackets were landed and threw up entrenchments for its protection. The Turkish Government, however, has never acknowledged the British claims in Koweit and the Germans treat them with ridicule. Basra, which is a more likely terminus for the Bagdad Railroad than Koweit, has not been so definitely claimed by England, but still it is not probable that the consent of England could be obtained for a German railroad to secure this or any other port on the Persian Gulf.

China's Difficulties

Of the six demands which the Russian Government made upon China for consular and trade privileges in Mongolia, four were promptly granted. Upon the other two points the Chinese Government held out, possibly in the hope of foreign support, but none of the Powers seemed inclined to interfere in a matter so remote from their own interests. The Russian Government then massed troops on the Russian frontier in Turkestan, ostensibly for "practice in mobilization," but obviously for the purpose of carrying out the threat of the occupation of Kuldja and the Ili Valley in case China refused to come to terms. Under this pressure China yielded and conceded the final demands of Russia which were the right of establishing a Russian consulate in Kobdo and free trade in Mongolia. Kobdo is a town of about 6,000 inhabitants north of Kuldja. The Russian demand for free trade was chiefly directed against the tea monopoly which was in the hands of the Chinese.——The plague in Manchuria continues its devastation. Over 20,000 persons have perished from it in the Harbin district. The fatality from the same disease in India is many times greater than this, but it does not create so much alarm because Europe has no railway connection with India while the plague may at any time reach Europe by the way of the Trans-Siberian Railroad.——The papers are full of unsubstantiated rumors of the intentions of Japan and Russia to seize and annex the portions of Manchuria under their control.

Socialist Legislators at Work

BY FRED L. HOLMES

THERE are one hundred Assemblymen and thirty-three Senators in the Wisconsin Legislature. Ten Assemblymen and two Senators are Socialists—all residents of Milwaukee. For the first time in the history of any American Legislature the Socialists have become so potent as a minority party that they must be reckoned with.

Disgusted with the flagrant misrule for years of an old bipartisan "gang" of Democrats and Republicans, the people of Milwaukee last Spring turned the city and county government over to the Socialists. Last fall they increased their Socialist representation in the Wisconsin Legislature from four to fourteen, and sent Victor Berger to Congress to take the seat of a Republican standpatter.

In the Wisconsin Legislature these fourteen men of manual occupations and limited educations have forced recognition. On two of the most important committees they rank ahead of the Democrats. And they are writing legislation upon the statute books.

How has this small minority succeeded in stamping its impress upon the legislation of Wisconsin? What methods has it employed to obtain results? With what effect is this entering wedge of Socialism driving its way toward the heart of republican government in the State of Wisconsin.

To be shown where the two Senators and twelve Assemblymen of the Socialist party sleep is to be told the secret of their effectiveness. They are a community of interests—one where the plan of mental co-operation is actually in force.

Finding deserted houses of the Legislature one evening because of theater attractions, I was invited to visit the Socialist rooming house. Passing along a side street we entered an old three-story stone building which housed a butcher shop and a creamery on the first floor. Down a long, uncarpeted hall—antique in the extreme—up two flights of heavy, pine stairs and we were on the threshold.

Such a picture. Here was a regular Socialist legislature in session, discussing resolutions and measures which were to come up for consideration the next day before the State Legislature. This wide, long barracks of a room had been used for many years by labor organizations as a meeting place. In one corner stood a large stove, perhaps a relic which had seen service in some district school before Wisconsin passed a law awarding bounties to the schools using furnaces for heating purposes. Near the center of the room was a long table piled high with newspapers, legislative bills and economic reference books, borrowed from various Madison libraries. Around the table sat a group of earnest men—some were smoking, some were in stocking feet—giving their ideas about a measure of the Wisconsin Legislature coming up for passage the following day.

Around the edge of the room and in the corners, protected by screens, were the beds of the members. Each owns his own little hard kitchen chair and his bed and pays his share toward a monthly room rental of $25. Save for a map and lonely calendar the walls are bare and desolate. Across the corner of an adjoining room hung the small washing of one of the members. Over the floor stretched a single rag rug. A newspaper folded cone-shaped served as a shade for the electric light hanging over the table. The whole scene bore evidences of privations and hardships similar to those suffered in Wisconsin lumber camps a score of years ago.

Here at 7.30 o'clock every evening "Speaker" Weber, for they are organized on the plan of the Legislature, calls the meeting to order. Every bill before the Wisconsin Legislature is handled upon this dissecting table. Plans are formulated as to who will offer debate, what amendments will be presented and what parliamentary methods will be followed either to hasten the passage or effect the defeat of a measure. Before this Socialist forum all differences of opinion among members are settled. Sometimes

the debates are long and vehement. Often the sessions are prolonged until after midnight. But next day in the Legislature the Socialists will vote as a body.

"We believe in co-operation," said Assemblyman Frank Weber, in discussing their plans of organization. "Two men usually have more ideas about the probable effect of a certain measure than one. So we all room together for consultation purposes. We can call a meeting of our members at any hour of the day and they will know where they are to meet. We settle our differences of opinion here and go before the Legislature with our substitute bills, amendments and plans for debate as a united body. A legislative floor committee composed of Assemblymen Brockhausen, Berner and myself settle questions that come up unexpectedly while we are in session at the capitol."

These Socialist members have little time for amusement. Financially they are too poor. They have come to the Legislature with a program as fixt as when they entered the City Hall of Milwaukee a year ago. They want to improve conditions for laboring men. They never dodge "roll calls" or grow weary of battle. Courage, pluck and determination they have.

Yet these zealous devotees of Socialism are but ordinary mortals—clerks, machinists, cigar makers, paper hangers, etc. They do not seek office for political honor but for political good. Not one spent more than $5 to secure his election. So they are not shackled to the "interests" or wedded to the breweries. They are making sacrifices, for without the most rigid economy it takes more than the legislative salary of $500 to live in Madison for six months.

Let us examine their membership. Assemblyman Frank J. Weber, dean of the members, is a sailor of thirty years' experience, and in 1893 he organized the Wisconsin State Federation of Labor; Fred Brockhausen, a thin, nervous fellow, for the past nine years secretary-treasurer of the State Federation of Labor, is a cigar maker; E. J. Berner, a cigar maker, has been interested in the trades union movement for the past fif-

A SESSION AT THE SOCIALIST ROOMING HOUSE.
Observe the beds in the adjoining chamber.

teen years; W. J. Gilboy is a shipping clerk; F. B. Metcalfe, nervous and eager, with plenty of ideas, is a glass blower; Jacob Hahn is a cigar maker; Michael Katzbahn is a core worker and molder; J. H. Vint is a machinist; Arthur Karn, a Bohemian Jew, is the organizer for the Bakers' Union; George Klenzendorff is an architect and estimator, and E. H. Kiefer is a paper hanger and painter with five children in Milwaukee. Sunday is a long day for Kiefer. He would like to go home to visit his family, but he has limited resources and no one can tell but that the session of the Legislature may be so prolonged that it will take his last dollar. Max Binner, secretary of the Socialists' legislative organization, is a "capitalist" among the members. Answering the charge that the Socialists knew nothing about taxation because they held little property, the young bookkeeper caused consternation by producing a tax certificate upon a little house and lot in Milwaukee upon which he had made a number of small payments.

In the Senate is the polished, affable Winfield R. Gaylord, State organizer for the Socialists, a former Methodist and Congregational minister. When he stands up there and begins to talk with the zeal of a John the Baptist, the assemblage listens. Gabriel Zophy, the second Senator, is a cigar maker. Ten of the fourteen members are married. And three of these Socialists are Roman Catholics—Gilboy, Katzbahn and Hahn.

To Wisconsin people these Socialists do not seem remarkably radical. Really they are the advance guard of a great civic movement. They are demanding shorter hours of labor for women and children, more municipal parks, public bath houses, better police and fire protection, regulation of tenement houses, improvement of street car service and the passage of laws compensating men injured while employed, regardless of the negligence of the employee or employer. In its entity theirs is a protest against misgovernment.

Examine this sample piece of proposed Socialistic legislation. Senator Gaylord has introduced a bill requiring all newspapers accepting public printing to declare themselves public utilities and to publish in each issue the name of every owner of 10 per cent. or more of stock. This measure, they argue, will disclose "to a certainty why certain capitalistic newspapers persist in making archangels out of certain heads of public utilities or other interests." The newspapers are not, however, to be interfered with in their privilege of a free press.

Briefly summarized here are a few of the Socialists' more radical ideas, which have been introduced in the form of bills before the Legislature:

Complete self-government for cities and townships.

Elective officers, city, State and national, shall be subject to a recall by the people.

Right to exercise the initiative and referendum on all legislative matters.

Giving a city the right to purchase public utilities and to take possession of them by paying the owners the price of the property.

Limiting the hours of labor of youths under twenty-one years and women of any age to eight hours a day. Prohibiting the employment of children under sixteen years in any factory.

Graduated income and inheritance tax law, small incomes to be exempt.

Removal of the principle of contributory negligence and the enactment of laws to compensate working men injured while employed.

Free school books and free school utensils to pupils of public schools.

Establishment in every county of the State of a farming school with a model farm.

Fire and accident insurance to be established by the State.

Gradually the Socialists have been gaining power in Wisconsin. Since the election of Mayor Emil Seidel in Milwaukee the party has built a meeting center called "Brisbane Hall," after Albert Brisbane, of Batavia, N. Y., the first native American Socialist of note. And of this Milwaukee home these Socialist legislators are proud.

From there to Congress next session will go Victor Berger, the brains of the Milwaukee movement, "boss of a bossless party," and the first Socialist to claim a seat in that august body. But he isn't the wild-eyed Socialist he is pictured to be. He isn't a Marx. His views are tempered. He is leading under the name of Socialism at the present time a movement for civic, social and industrial reform. Meantime, the little party gazes clairvoyantly into the heart of Wisconsin for new fields of conquest.

MADISON, WIS.

My Superannuation

[The Methodist preacher who contributes the following article is the same who wrote in THE INDEPENDENT of November 9, 1905, "The Story of a Handicapped Life." As we did with the earlier article, so we accompany this with an editorial expressing our admiration of his spirit and ideals under adverse physical and ecclesiastical conditions.—EDITOR.]

WHEN, five years ago, I wrote the story of my own life, I had been in the Methodist itinerancy almost twenty-eight years. At that time I was pastor of three churches in one of the upper counties of my native State, one of them in the county seat, the others in the country. Besides these I had a little, almost abandoned, church, where I preached one sabbath afternoon in each month. I had been pastor in this charge twenty years before, and when I returned to it a second time, after the lapse of so many years, I found, greatly to my joy, that the people, many of them at least, remembered my former pastorate, and these, with the children of some who had passed away, gave us a warm welcome. Our home was very pleasant. The parsonage, a pretty cottage of five rooms, with a front and back veranda, stood on a hill overlooking the little village, and a chain of mountains was only a few miles away. It was a delight to watch the sunsets from this home on the western hillside, especially in the summer and early autumn, when the sun went to its setting thru a mist of gold. And we were happy here the two years we tarried among my old friends. The people knew of my defective sight, but were considerate, and not over-exacting. Our salary was $400, and for the first time in my ministry I received more than the stewards had assessed for me. And, too, when my horse died, my friends soon had another one in my stable, fully paid for. But there were disadvantages. The town was twelve miles from the railroad, and the school was not such as I needed for my daughters, who were now twelve and fifteen years old respectively.

At the session of our conference, which was held in November, I was read out to H. And we were delighted. The change involved a move of more than a hundred miles, at a cost of over $50, and a separation from many dear friends, but there was a fine school at H., and for the sake of my children, and because the appointment was something of a promotion, we left our home in the little mountain town with regret, of course, but with hopefulness as well.

Our welcome to our new circuit was delightfully cordial. We found a good parsonage, well finished, our little girls had a room all their own, an unusual experience in their lives, and the people furnished us many good things as the Christmas holidays came on, besides what we had found in the parsonage on our arrival.

H. was a choice community. The school, which had been established almost a half century, was of high grade, and its patrons were mainly people of means who had come to the community for the advantages the school afforded. The population was something like 500, and most of the families were wealthy, or at least well to do, owning plantations in one of the adjoining counties, which is one of the most productive counties of the State. The business of the village was not large nor urgent. The people had settled in H. for homes, the school and the churches. They took life in a leisurely way. They had time, and took time to cultivate the social virtues. Thru the village ran an old, historic public road, shaded by fine trees, and under these nestled the homes of the denizens of the town. These were built largely for summer comfort, and were nearly all modeled after one pattern. And we found the climate quite agreeable after our sojourn among the mountains. The sea, hardly a hundred miles away, was near enough to give us a fine breeze at night, and the sandy, porous soil, thru which the water filtered to a great depth, made the air and grounds so dry, especially in winter, that we had few unpleasantly cold days during the four winters

we spent there, and the summer heat was less oppressive because of the altitude of the location.

And those four years were the happiest in our whole itinerancy. I had never preached to people who were so appreciative. Instead of discounting me on account of my defective sight, they seemed to think all the more of me for it. The charge involved much work, but work is never hard when it is congenial, and done for congenial people. Every Sunday in the month, except one, I preached three times, morning, afternoon and night, and on one Sabbath, I rode at least fourteen miles in filling these several appointments. But my health was almost perfect, the congregations at the different churches were responsive to a degree that I had not known before, and during my pastorate of four years, the membership increased by something like a hundred. My salary went up from $580 the first year, to $700 the last year. I found, too, an opportunity to do some newspaper work, which added substantially to my income. The situation, the love of the people and the success attending my labors, made us all very happy. My daughters graduated from the school, my son secured a place as a reporter on a newspaper in the city not far away, and I supposed that the hardships of the itinerancy would never be as great again as they had been before. I knew I was past fifty, and that the end was not many years away, but I saw before me no imaginary dead line. And my presiding elder assured me that I was no longer hard to provide for. "You know," he said kindly (he had been a presiding elder a number of years), "that we have found it a little difficult to place you sometimes, but I am sure that is over now." He assigned as the reason for this difficulty, of course, the fact that I could not see well, but was much more gentle and brotherly in his reference to this infirmity than some of my presiding elders have been.

At last the time came for us to leave H. My oldest daughter had a school not far away, and came home every Saturday; my youngest daughter was less than fifty miles away, teaching in a private family; we would have been willing to tarry in the village all the rest of our lives, and we were assured that the people would be willing to take us indefinitely. But—we must move. The four year limit to the pastorate is inexorable. We pray over our appointments; the Bishops and the presiding elders, we are assured at conference, pray every earnestly over them, and the people are supposed to pray over them, but it is understood in all our prayers that the good Lord has never yet made a Methodist preacher in this latitude who can serve the same church effectively longer than the prescribed four years of the Methodist discipline. And we have never yet mustered up enough faith to ask him to do this impossible thing. We believe that Providence has called some men to be Bishops for life; we are willing for our connectional officers—editors, missionary secretaries and the like—to hold office as long as they can command enough votes in the General Conference to re-elect them, but we do not expect nor ask the same Providence to do what is not supposed to be desirable or even possible, and call some men to indefinite pastorates in particular charges.

I went up to the annual conference that year with much sorrow, but with no great degree of anxiety. It was a grief to leave H., but I have tried to be true to the spirit as well as the letter of the itinerancy, and I knew that there was no possible chance for me to stay in the village I loved so much any longer. My presiding elder declared that he had arranged for me to have the best appointment I had ever had, and spoke so specifically about it, that I began to guess where it was (Methodist preachers are not supposed to know their assignments until the Bishop reads them out at the close of the conference sessions). But when the appointments were read, I had a very different place from what I had supposed I should get. And I did not reach the appointment at all. I did not know all the facts in the case until afterwards, and I have no heart to go into these details now. Suffice it to say, the infirmity which came with me into this world, and which has gone with me all thru my years, met me at the threshold of this appointment—and I was changed to another, and afterwards to still another. Fortunately, all these changes

were made before I shipped my household stuff from H., but for several days I was in suspense, not knowing whither to go. At last I was notified that I had been assigned to the B—r circuit. Hiring a man to drive my horse and buggy thru the country to W., some seventy miles away, I took the train with my trunks. My wife, who had been visiting relatives, joined me later, and by the first of December we were settled in our new quarters.

There were only three churches, but the membership was scattered over a section of hilly, broken country, at least twenty miles square. And the churches, like many other country churches in our bounds, were greatly reduced in numbers from what they had been in other days, and the people were more discouraged than I have ever found folks anywhere in all my ministry. It was a difficult field for any one, and to place me on it, where my failure to see well would count for more against me than on almost any other charge in the conference, was to foredoom me to failure. The people were kind, our salary was enough to provide amply for all our needs, and our home was large, with a pretty yard, covered with Bermuda grass; but the year's work was the most unsatisfactory in my pastorate—and the last.

Just before the meeting of the annual conference, our fourth quarterly meeting was held. At this session the officials caucused with the presiding elder. Of course I was not invited into this caucus. I learned thru the presiding elder himself—when I questioned him—what was said. It was all kind, he asserted, but the outcome of it all was that we understood that we would have a change. "But you need not be uneasy," he said, reassuringly, "I can take care of you." And so I went up to conference, suspecting nothing of what was to come.

On the third day of the session, my presiding elder came to me and said, "I want to talk with you a little" (he is the son of the presiding elder who kept me out of the itinerancy three years at the outset of my ministry). We made our way to one of the Sunday School rooms of the church—we were in session within a few miles of my childhood home—and finding some chairs, we sat down. After a little hesitation, he said: "The presiding elders think you ought to superannuate."

The announcement stunned me. I was dumb with dismay. Nothing, not even death itself, is so much dreaded by a Methodist preacher as superannuation. It means cessation of pastoral work. It means that he is no longer acceptable as a preacher. It means that he must go out, often without a home or means of support, into poverty and old age. The largest allowance paid to a superannuate from what is known as the "conference collection" is not half the average salary of the active pastor. And the pastor who can save anything out of his salary for old age is more fortunate than most of us have been. The experience is the testing time in a Methodist preacher's life. He has nothing before him but years of growing weakness and infirmity, nothing in the past but memories of activity, the very recalling of which grieves his soul, because he can be active no more, and even the love of his brethren is too often of the pitying sort that only adds to his sense of loneliness. Happy indeed is he whose faith does not fail during these twilight years.

I need not tell in detail all that happened. I went to see the Bishop. I talked with several of the presiding elders, one of whom had been licensed to preach under my pastorate. I counseled with my friends. I yielded to the inevitable—and when the session came to its close, I was on the list of superannuates. My poor eyes had at last brought my ministry to an abrupt ending. The brethren gave this as the only reason for my superannuation.

And now a strangely Providential thing happened. Some years ago a movement was started here and there to build superannuate homes. In one of the prettiest little cities of the State, and in one of the finest sections of the commonwealth, a beautiful little cottage was built by a lady of means and piety, and turned over to the Church for a home for a wornout preacher. One of the best men in our conference had occupied it for a time, but was now dead. This home was open, and in three weeks after the adjournment of our conference, my wife

and I found ourselves in possession of this home.

Our reception was gracious. A committee met us at the train, another was in waiting at the "Home," which was warmed by a fire in all the rooms, a warm supper was on the table, provisions for a month were in the pantry, a ton of coal was in the back yard, and all our wants for many days to come were anticipated.

And the "Home" is beautiful. There are five rooms, including the kitchen, the finishing and furniture are homelike, and here we may stay the rest of our lives. Our rooms are not large, and the dining room, which is also our sitting room and library, is just a bit crowded, but everything is so fresh and comfortable that we are gladly content and grateful that our last years may be passed in really the most beautiful home we have ever had.

And we are alone, except that for the present my wife's sister is with us. Our son has a fine position on one of the leading dailies of the State; our oldest daughter is married to a good, worthy young man, and our youngest daughter, tho only seventeen, has an excellent position as a teacher.

But it is not easy for me to become reconciled to my superannuation. I loved my work. I dream of it now. I wake in the night and sorrow that the pastorate is closed against me forever. My grief lurks in the outskirts of my thought by day, and mocks me in my most cheerful hours. And I feel deep mortification. If I am a superannuate now, I have been for years. If so, I have imposed on the charges I have served. If not, then I feel that I am, in some sort, a party to a piece of injustice to the Church. But I cannot help myself. The Church has taken the heart of my working years, and now I am taking what it gives me in return. And I shall not be idle. I have some lectures that I shall make as occasion may offer. A book written by me (not that novel, however) will be published in the early spring, and so I am not without work nor hope. When my life's sun goes down, I trust that there will be no clouds except those that tell of a brighter tomorrow.

I have given thirty-three years to the pastorate. I would gladly give as many more. I knew when I entered the ministry that I need not expect anything great in the way of place and preferment, and the knowledge during all these years has saved me from temptations to rival other men. And it has helped to make me content when otherwise I might have been dissatisfied. I am now sixty years old, my health is good, my sight is no worse than it has been all my life. I am sure that I am capable of doing better work than I have ever done, my income will hardly reach $400, and I know that we must live a severely simple and economical life; but I am resolved that I will not allow myself to become a cynical old man. I have preached the Gospel of faith and hope and courage to others, now I shall seek to live that Gospel before others.

The Appropriations of Congress

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

THE total appropriations by the Sixty-first Congress at its third session amounted to $1,025,489,661.54. The items for which more than $10,000,000 was appropriated follow:

Agriculture	$16,900,016.00
Army	93,374,755,97
District of Columbia	12,057,236.50
Legislative, etc.	35,378,149.85
Navy	126,478,338.24
Pension	153,688,000.00
Post Office	257,539,113.00
River and harbor	23,855,342.00
Sundry civil	142,149,144.14
Permanent annual	129,575,924.12

The last item includes the interest on the public debt and an amount set aside to meet sinking fund obligations. It is estimated that $61,000,000 will be required for the sinking fund in 1912. Of the sundry civil appropriation of $142,000,000 nearly $49,000,000 is for the construction and fortification of the Isthmian Canal. Of the $257,000,000 appropriated for the Post Office it is estimated that all but $7,000,000 will be returned from the postal revenues for the fiscal year 1912. This appropriation amounts to more than five-sixths of the entire appropriation for the support of the Government for a two-year period only a generation ago. The amount appropriated for the rural free delivery service for the coming year is nearly $43,000,000, or more than the total cost of the entire postal service less than thirty years ago. About $375,000,000 is appropriated for army, navy and pensions, while the diplomatic and consular service receives less than $4,000,000.

A century ago, or in 1810, the total ordinary expenditure of the Government was $8,400,000. Of this $3,200,000 was spent for the army, $1,700,000 for the navy, $3,200,000 for interest on the public debt. Pensions cost less than $84,000.

Our population was then over 7,000,000. At present it is thirteen times that, while ordinary disbursements have increased eighty fold.

The Federationist.—I.

FOR over a decade now, as our faithful readers know, THE INDEPENDENT has been doing everything possible to popularize the peace movement, which is nothing but the process of substituting law for war. The fruition of these efforts has been even beyond our expectations, large as they were.

It seems to us that the peace movement has now assumed a new phase. By the universal agreement that a third Hague Conference should convene about 1915, and by the authorization of the Peace Commission last spring by the United States Congress, the nations of the world are brought to a position analogous to that in which the American Colonies found themselves when the Continental Congress convened in 1775. The Confederation and afterward the "more perfect Union" which we still enjoy, resulted from the efforts of our forefathers for justice and peace founded on political principles duly declared and acknowledged.

The contributions of three men to the discussion which produced such results have become a classic in political literature. We refer to the articles by Alexander Hamilton, John Jay and James Madison, published anonymously and known in their collective form as "The Federalist." Curiously enough, many of "The Federalist" papers were first published in a journal called *The Independent Review*. Senator Lodge, in the preface to his edition of these historic documents, says:

> "The essays of Publius [by whom the papers were signed] are undoubtedly a great work upon the general subject of political federation . . . which have assumed the weight and sanctity of judicial interpretation."

The work done for the American States by the anonymous publication of these essays in the newspapers and magazines of that day remains in great part to be done for the sovereign states of the world. We think some articles already published in THE INDEPENDENT are worthy of a place in any collection of "International Federalist" papers that may be made. The time is at hand for the publication of other essays of such character and scope as to aid in the universal effort to relate the nations of the world so as to "establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity," to quote the preamble of our own Constitution.

However long the process, we are convinced that the whole world of today will accomplish for itself what the American world of yesterday, so to speak, accomplished for itself. In our effort to assist in the achievement of "a consummation so devoutly to be wished," we will keep our columns open to the highest authorities, as in the past, until the work is finished and the Constitution of the world is ordained.

The following article by one who is generally conceded to be the leading international lawyer in the United States gives a preliminary survey of how far the nations have already gone in the movement for world organization. It will be followed shortly by another on "The Work Before the United States Peace Commission." Then, as occasion requires, we shall print from time to time other papers on the various problems of world organization, under such general titles as "Progress in Pan-Americanism," "Jurisdiction of International Courts," "The Constitution of a League of Peace," "Proper Constitution of a Permanent Hague Conference," "The International Police," etc.

Our readers can assist in contributing to the final result by giving their assent to the right ideas when presented. The wide dissemination of true ideas among the peoples with their fruition in the consciousness of mankind is, after all, the harvest field of greatest value.—EDITOR.

The Federal Tendency

BY JOHN BASSETT MOORE, LL.D.

Ex Assistant Secretary of State and Professor of International Law in Columbia University.

IF there is one tendency more than another that has characterized the history of the past hundred years, it is the drift toward consolidation—the federal tendency. This tendency has no doubt been accelerated by the improvement in means of communication, but fundamentally it is chiefly to be ascribed to the growth of a sense of interdependence and of a clearer and larger perception of the need of co-operation for the efficient development and conservation of common interests.

When we speak of consolidation or combination we usually think of what has taken place in commerce and in industry; but the tendency has been no less marked in politics, and not only in national but also in international politics. It is true that the most striking and obvious examples of it in the political sphere have been along the lines of national consolidation in places where conditions favorable to the movement had long been maturing; but unmistakable proofs of the same tendency may also be found in international relations.

In the study of government, we commonly and conveniently classify the powers which are exercised for the preservation and advancement of political and social interests as the executive, the legislative and the judicial. And we look upon the union of the three as essential to the maintenance of the reign of law, which is the fundamental condition of civilized life. It is just here that the distinction is sharply drawn between the conditions that exist within national boundaries and those that exist between independent states, and in particular between municipal law and international law. Within national boundaries we witness the constant and regulated operation of legislative, judicial and executive powers; while as between independent states we have been accustomed to rely upon diplomacy, upon occasional arbitration, and in the last analysis, upon war as the only legal measures of procedure. Are we justified, however, in looking upon these measures as products of the last and final stage of international development? Are we not rather obliged to admit that the state of things in which they formed the sole and all-sufficient methods of action, is one out of which we are passing? It not infrequently happens that great changes take place so gradually that we are unconscious of them till they have been accomplished, and that we acclaim as the beginning of an era of change that which in reality marks only its consummation. Let us examine certain phases of history comparatively recent.

And first let us consider the progress made toward a definite and written international law; and I may say at once that I do not speak here of codification, which involves special and debatable questions which need not be here discussed.

There are two modes in which international law may be developed. The first is the general and gradual transformation of international opinion and practice; the second is the specific adoption of a rule of action by an act in its nature legislative. While the former mode, which at one time was almost exclusive, has not ceased and will not cease to operate, the past hundred years have been distinguished by the modification and improvement of international law by means of what may be called acts of international legislation. By the treaty of Vienna of June 9, 1815, it was agreed that rivers which separated or traversed two or more States should, along their navigable course be, in respect of commerce, entirely free to every one, subject only to regulations of police. This principle was applied primarily to the Rhine, but was also expressly extended to the Neckar, the Mayne, the Moselle, the Meuse, and the Scheldt. While this act which was binding only upon the parties to the treaty of Vienna, did not establish a general principle of international law, it constituted an important step in the direction of international legislation and led to the adoption of the same principle or similar principles by other Pow-

ers. But it did fall to the lot of the same congress to formulate and agree upon an act which by its acceptance by all the Powers composing the international circle established a general rule of international law. This was the act by which the rank and precedence of diplomatic agents were regulated. The rules of the Congress of Vienna, slightly modified by the Congress of Aix-la-Chapelle of 1818, are still in force and form to-day the written law on the subject to which they relate.

Yet more remarkable, as an act of legislative aspect, was the declaration on maritime law made by the Congress of Paris of 1856. The declaration embraced four rules:

(1) Privateering is and remains abolished.
(2) The neutral flag covers an enemy's goods, with the exception of contraband of war.
(3) Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag.
(4) Blockades, in order to be binding, must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy.

These rules, altho the declaration originally bound only the parties to the congress, have, with the exception of the first, become by universal acceptance well established principles of international law.

Beginning with the convention concluded at Geneva, August 22, 1864, commonly called the "Red Cross Convention," for the amelioration of the condition of the wounded in armies in the field, various acts of international legislation have been adopted with reference to the conduct of warfare on land and on the sea. Among these we may mention the Declaration of St. Petersburg of 1868, which was framed by an international military commission; and the project of declaration of the Brussels conference of 1874, which covered the whole field of wars on land, and which, altho the Powers represented in the conference afterward failed to ratify it, not only became the model for subsequent military manuals and practice, but also formed the basis of the convention adopted at The Hague in 1899 respecting the laws and customs of war on land.

The Hague Conferences of 1899 and 1907 represent, it is needless to say, the most advanced step taken in the direction of international legislation and the constitution of an international legislature. By the first conference three conventions and three declarations were adopted. The conventions related to the following subjects:

(1) The peaceful adjustment of international differences.
(2) The laws and customs of war on land.
(3) The adaptation to maritime warfare of the Geneva Convention of 1864.

The declarations were designed to prohibit (1) the launching of projectiles or explosives from balloons; (2) the use of projectiles the only object of which was to diffuse asphyxiating or deleterious gases; (3) the use of bullets which are so made as to expand or flatten easily in the human body.

By the second Hague Conference, in which substantially the whole civilized world was represented, thirteen conventions and one declaration were adopted. The conventions covered the following ground:

(1) The pacific settlement of international disputes—a convention amendatory of the great convention of the first conference on the same subject.
(2) The limitation of the use of force for the recovery of contract debts.
(3) The method of beginning hostilities.
(4) The laws and customs of war on land—a convention so amending that of the previous conference on the same subject as to embrace the stipulations of the Geneva Convention of July 6, 1906.
(5) The rights and duties of neutral Powers and persons in war on land.
(6) The status of enemy merchant ships at the outbreak of hostilities.
(7) The conversion of merchant ships into ships of war.
(8) The laying of automatic submarine contact mines.
(9) Bombardments by naval forces in time of war.
(10) The adaptation to naval war of the principles of the Geneva Convention of July 6, 1906.
(11) Certain restrictions upon the exercise of the right of capture in naval war.
(12) The creation of a naval prize court.
(13) The rights and duties of neutral powers in naval war.

The declaration adopted by the conference related to the prohibition of the discharge of projectiles and explosives from balloons.

By the naval conference at London of 1908-9 an important declaration was formulated on the subject of maritime law.

It is not possible at the present time to say precisely to what extent the acts of the second Hague Conference will eventually be put into force, but there is no doubt that the work of the conference will have important and far reaching effects in the domain of international legislation. The project of the London Conference of 1908-9 is still pending, and its fate has not yet been determined.

Less striking, but scarcely less important, have been the steps taken in recent years toward the unification of maritime law in time of peace and of the rules governing the conflict of laws or private international law. Nor should we overlook the International Marine Conference (Washington, 1889-1890), which resulted in the establishment of uniform rules of navigation at sea.

From this survey of what has been done in the direction of international legislation let us turn to the field of judicial action. International arbitration is by no means a new thing, but there has been a striking growth in the past hundred years of the practice of submitting international disputes to arbitration; and ahbitration is a judicial process. Putting aside the very numerous cases erroneously included in lists compiled by persons lacking in information and in discrimination, we find at least 136 completly executed treaties or agreements of arbitration during the nineteenth century. In some instances these agreements provided for comprehensive settlements embracing hundreds of particular cases and involving many millions of dollars as well as points of "vital interest" and "honor;" and if the various tribunals be taken together, their sittings far exceeded in the aggregate the time that would have been occupied by those of a single tribunal always in session. The achievements of the century were therefore fitly crowned by the great convention adopted at The Hague in 1899 by which a permanent international court was established. While it is true that this convention does not designate the judges for each case that may be submitted to it for decision, but provides for an eligible list from which they may be selected, yet the court is itself permanent; and the wisdom of the framers is shown in the fact that, altho they did not undertake to impose universal obligations, they also refrained from declaring general exceptions to the principle of arbitration. At first, the attitude of nations towards The Hague Court was apparently hesitant, but the resort to it is now becoming more frequent. Three cases, including the important Newfoundland fisheries controversy, have been decided by it in the past six months. Meanwhile, the number of arbitrations before other tribunals specially created by treaties between particular Powers, increased.

Finally, we observe the development of the spirit and practice of co-operation in the domain of executive or administrative action. It is seen, first of all, in the network of treaties which some generations ago the European powers began to form for the purpose of securing joint or concurrent action, as the case might be, with regard to situations of special interest and importance as affecting the balance of power. As a result there eventually came into existence what is known as the concert of the Powers, which altho its aims were chiefly political, came incidentally to embrace matters of common social interest. Social interests are, however, essentially worldwide, and in dealing with them the circumscriptions of political interest have naturally been disregarded.

Usually, the measures agreed upon for the attainment of common interests are carried out within each jurisdiction by the local sovereign, but now and then a central international bureau is established for the purpose of securing uniformity and efficiency of action.

The tendency toward co-operation for the attainment of common social ends is nowhere more clearly exhibited than in the growth of the system of extradition. In former times there existed a strong repugnance to the surrender of fugitives from justice. This was due partly to the ancient idea of asylum, partly to perverted notions of national dignity, and partly to groundless prejudices. It was not until the middle of the last century that the great expansion of the system began. Since that time its growth has been rapid and far-reaching.

A narration of the efforts by international arrangement and concerted action to put an end to the African slave-trade would fill a large chapter in the history

of international relations during the past seventy-five years. The great obstacle in the way of the accomplishment of the object in view was the proper indisposition of various Powers to do anything that might lead to the revival of the practice of visitation and search on the high seas in time of peace. In 1890, however, a conference was held at Brussels, and a convention was signed by which provision was made for a plan of joint action in certain seas adjacent to the coasts of Africa.

Numerous conventions have been entered into in recent times for the co-operative regulation of the fisheries on the high seas, both in respect of food fishes and of fur-bearing animals whose habitat is the sea. We may look forward to the time when fisheries disputes will cease to exist thru the operation of international arrangements.

In 1875, a treaty was concluded at Paris for the creation of an international bureau of weights and measures. Eight years later, in 1883, a number of the powers of Europe and America joined in forming an international union for the protection of industrial property; and various governments, which were not among the original parties, have since acceded to it. The next year a convention was entered into by the representatives of twenty-six States, for the protection of submarine cables outside territorial waters. In 1886 came the Bern agreement, commonly called the international copyright convention, for the protection of property in literary and artistic works. The representatives of twenty-seven Powers, European and American, signed the International Radiotelegraphic Convention, which was concluded at Berlin in 1906. The larger European Powers and many of the smaller ones are parties to international conventions prohibiting (1) the working of women at night in industrial employments, and (2) the use of white (yellow) phosphorus in the manufacture of matches, as well as to a convention to regulate the circulation of motor vehicles. An interesting feature of the convention prohibiting the working of women at night in industrial employments is that it provides for an international commission to decide controverted questions, with a reservation of the right to resort to the Permanent Court at The Hague. As a result of the International conference of American States which sat in Washington in 1889-1890 there was established, with a central bureau at Washington, the International Union of the American Republics, which was confirmed and extended by the Fourth International American Conference at Buenos Aires last year under the title of the Pan-American Union. We may also mention, without particularly describing them, the following arrangements, to which both European and American governments are parties: The International Union for the Publication of Customs Tariffs (1890); the International Sanitary Conventions (1903, 1905), and the arrangement (1907) for the establishment of an International Office of Public Health; the agreement for the repression of the trade in white women (1904); and the convention for the creation of an International Institute of Agriculture (1905). But, of all the international measures that have been adopted for the purpose of securing administrative co-operation and common administrative ends, certainly not the least interesting or the least significant is the Universal Postal Union. As that venerable manual, the Almanach de Gotha, observes, the constituent countries under this arrangement, which embraces substantially the entire world, form, for the purposes of the reciprocal exchange of correspondence, a "single postal territory." Thruout this territory there prevail similar facilities and regulations, and, while the autonomy of each local administration is preserved, there is a central office, called the International Bureau, which is conducted at Bern, under the superintendence of the Swiss postal administration, but which is in fact maintained by all the administrations of the Union as a common administrative organ. Here, then, we have, under a compact essentially federal, a form of international life; for, while the members retain their sovereignty and independence unimpaired, they co-operate by common means for the attainment of a common end thruout the entire domain of the Union.

New York City.

Progressive Republicanism: The New Democracy

BY JAMES W. GARNER, Ph.D.

Professor of Political Science in the University of Illinois.

THE public dispatches from Washington recently announced the launching of an organized movement by a group of distinguished "progressive" Republicans, the purpose of which is to promote a more general introduction of the principles of direct democracy into our political life. The program of the National Progressive Republican League, as the new organization is styled, includes the following important political reforms which if generally adopted will greatly extend the direct participation of the people in governmental affairs, increase the effectiveness of popular government and work a far-reaching transformation of our representative system: (1) The popular election of United States Senators; (2) the nomination by direct primaries of candidates for all elective offices; (3) popular election of delegates to national conventions, including the right of the voters to express their choice at the primary for President and Vice-President of the United States; (4) the more general introduction of the referendum, initiative and recall by constitutional enactment; and (5) the adoption of thorogoing corrupt practices acts to insure the purity of elections and the expression of the uncorrupted will of the people at the polls.

I am asked to give a brief exposition of the meaning of these newer forms of democracy and of the methods by which they are or may be applied in practice.

1. *Popular election of United States Senators.* The existing method of choosing United States Senators has led to widespread popular dissatisfaction, first of all, on account of the frequent bribery scandals which have come to be a common feature of the system. It also frequently leads to prolonged deadlocks which sometimes result in leaving the State wholly or partially unrepresented in the Senate or result in the election of Senators who are not or never would be the choice of the people; it introduces demoralization into the politics of the States; it interferes with the discharge by the Legislature of its normal legislative duties, and often divides that body into hostile factions and gives a party coloring to the consideration of many legislative measures which are really non-partisan in character. Under the existing system, the nomination of Senatorial candidates is made by the members of the legislature of each party, in a secret caucus, and where the two parties are fairly equally divided in numbers and the members of the dominant party are unable to agree upon a candidate, it may and does happen that the nomination is finally made by scarcely more than one-fourth of the members of the legislature upon whom the choice devolves. On at least five different occasions the National House of Representatives has passed by large majorities resolutions proposing to amend the Constitution so as to provide for popular election of Senators, and some thirty-five States in some form or another have endorsed the proposal, but each time the Senate has refused its concurrence. The question is again before the Senate, and as I now write a tremendous effort is being made by the friends of popular election to bring that body into line so as to give effect to the popular demand.

Meantime, many of the States which have adopted direct primary laws have undertaken to secure the substance if not the form of popular election by allowing the voters of each party, at their State primaries, to indicate their preference for Senatorial candidates. But so long as the legal power of choice remains with the legislature, the results of the popular vote cannot be regarded as anything more than an expression of opinion which may be disregarded by the legislature at will. Indeed, this is expressly declared in some of the primary

laws which allow the voters to express their preferences for Senatorial candidates.

2. *The Direct Primary.* Ordinarily, a primary election, or a primary, as it is frequently called, is a meeting of the voters of a political party for the purpose of selecting delegates to a nominating convention. Recently, however, some twenty States have adopted primary laws giving the voters the power of nominating their candidates directly, without the agency of a delegate convention. This is the direct primary as contradistinguished from the indirect primary, which prevails where the convention system is in force. Where it has been introduced, the delegate convention has been done away with except as an agency for preparing the party platform, for choosing delegates to national conventions and sometimes for electing party committees. The candidate gets his name on the primary ballot by petition; that is, he gets a certain percentage of the voters of his party to sign a petition approving his candidacy, in which case the proper election official must print his name on the ballot.

In order to discourage straight party voting, what is known as the non-partisan primary has been provided in a number of States for the nomination of candidates for judicial positions and for municipal offices. A non-partisan primary is one in which no party column, circle or symbol appears on the ballot, the candidates of all parties usually being arranged alphabetically under the head of each office, with nothing to indicate their party affiliation.

3. *Popular Election of Delegates to National Conventions.* Candidates for President and Vice-President of the United States are still nominated by delegate conventions. The four delegates-at-large from each State are chosen by the State conventions of the respective parties, and the district delegates (two from each Congressional district in the State) are elected by party conventions in the several Congressional districts, except that the practice of the Democratic party allows each State to choose its delegates entirely by the State convention, or partly by the State convention and partly by district conventions, as it prefers. It is now proposed to abolish the present system of choosing delegates to national conventions and allow the voters of each party to elect their delegates directly in the same way as they nominate candidates for State offices in those States having direct primary laws. This, however, does not mean direct nomination of candidates for President and Vice-President; under such a system they would still be nominated as now by national conventions. However, in order to secure an expression of opinion by the voters of each party, it is proposed to give them an opportunity in choosing delegates to their national conventions, to indicate at the same time their first, second and third choices for Presidential and Vice-Presidential candidates, which expression of opinion shall be considered as morally binding upon the convention.

4. *The Referendum.* The referendum, the employment of which it is proposed to extend by constitutional provision, has been defined as the power the people reserve to themselves of approving or disapproving, thru a popular vote, the acts of the legislature or proposed constitutional amendments. In form it may be either obligatory or optional. It is obligatory whenever the law passed by the legislature must be submitted to the voters for their approval or disapproval; and optional where the law is required to be submitted only upon the petition of a certain number of voters. Considered from the standpoint of the effect of the popular vote, the referendum may be mandatory or advisory. It is mandatory when the result of the popular vote is legally binding upon the legislature, and advisory when the result is merely an expression of opinion, and hence not conclusive. In many States a referendum is required upon legislative acts increasing the State debt beyond a certain amount, acts loaning the credit of the State, and various measures of a similar character. In a considerable number, a referendum upon the acts of the legislature may be had upon petition of a certain percentage of the voters, usually 5 per cent. Emergency measures, however, such as those for the immediate preservation of the peace, health or safety, are generally excepted from the ope-

ration of the referendum, as are also bills appropriating money for the support of the State Government, State institutions and the public schools.

5. *The Initiative.* The initiative is the power reserved by the people themselves to propose laws or constitutional amendments, and to enact or reject the same by popular vote, independently of the will of the legislature. While under the referendum the people have merely the negative power of accepting or rejecting bills enacted by the legislature, the initiative gives them the positive power of proposing and adopting measures of their own, regardless of the will of the legislature. The method of procedure by which a proposed law or constitutional amendment may be popularly initiated is by petition signed by a certain proportion of the voters, usually 8 per cent. The petition must contain the full text of the measure and must be filed with the Secretary of State, who is required to submit it directly to the voters at a general or special election, or, as is allowed in a few States, to lay it before the legislature, which body may in turn enact or reject it. In the latter case, however, the legislature must submit the proposed measure to the voters, tho at the same time it may submit a competing measure. For the enlightenment of the voters, a few States require arguments for and against the proposed measures to be prepared, printed and distributed among the voters. Some, like Oregon, also permit advocates and opponents to file printed arguments with the Secretary of State, who is required in such cases to furnish at public expense each voter in the State with a copy of the arguments in pamphlet form.

7. *The Recall.* One of the newest of the democratic expedients, and one which is now being widely advocated in many communities, is the recall, a device by which the electorate may retire an unfaithful or incompetent official before the expiration of the legal term for which he was elected. The procedure by which the recall may be employed is by petition, signed by a certain number of the voters, and addressed to the proper official, requesting that an election be held. The official whom it is desired to recall may resign or he may stand for re-election, in which latter case he must give account of his official stewardship. Other persons are allowed to become candidates against him, and the one receiving the highest number of votes is elected to the office for the remainder of the term.

This device was first adopted by the city of Los Angeles in 1903, and the threat to use it against a boodling alderman of that city in 1909 led to his resignation. It has since been adopted in many other cities of California, including San Francisco.

It is also in force in Seattle and has recently been made use of to displace the mayor of that city. Most of the recent laws empowering cities to adopt the commission form of municipal government contain provisions for the recall of mayors and commissioners, tho in few of them has it been found necessary as yet to make use of the power. Finally, Oregon, by a constitutional amendment adopted in 1908, provided that every public officer in the State might be recalled by the voters at any time and for any reason that might seem to them proper. Upon petition by 25 per cent. of the voters, a special election must be ordered, at which the voters are given an opportunity to endorse the official complained of by re-electing him or to retire him by electing another to his office. Such a system is advocated as a necessary means of enforcing popular control over public officials and for making the will of the people prevail in political affairs.

8. *Corrupt Practices Acts.* Corrupt practices at elections include such acts as bribery, intimidation or the use of other undue influence over voters, personation, repeating, false registration and similar abuses of the electoral privilege. All States now have laws prohibiting such practices, tho the penalties imposed are sometimes wholly inadequate. A thorogoing corrupt practices act, such as the Progressive Republican League advocates, and such as has been enacted in a few States, would go further and prohibit treating, including the giving away of liquor and cigars at elections, the solicitation of campaign contributions from candidates by other persons than political committees, promises to secure

appointments for voters or political workers in return for their votes or influence, and the levying of assessments upon officeholders for political purposes or the solicitation of their contributions.

The law of every State should place restrictions upon the expenditure of money for election purposes. Already the laws of many of them limit campaign expenditures to such purposes as the hiring of public halls and music for conventions, printing, postage, advertising, renting of rooms for committees, the payment of public speakers, clerk hire and similar legitimate purposes. Some States expressly limit the amount of money that may be expended by treasurers of political committees or agents, and some the amount which candidates may themselves expend. In order to enable the candidate without means to meet the legitimate expenses of an election campaign, Colorado goes to the length of providing a fund out of the public treasury, to be distributed among party committees on the basis of the voting strength of each party.

A reform for which there is a widespread popular demand is greater publicity in respect to campaign expenditures. The most advanced corrupt practices laws now require that every political committee shall have a treasurer, who must keep a detailed account of all moneys received and expended under the authority of the committee, together with the name of the contributor and the amount of his contribution, and must file the same with some public officer a certain number of days before the election. This statement must be sworn to and is open to public inspection. The law of Nebraska goes further and prohibits the treasurers of party committees from accepting more than $1,000 from any one person, or from receiving within two days of the election any contribution in excess of $25. The objection to the publicity feature of most corrupt practices acts, including that passed by Congress in 1910, is that they do not require the financial statements of political treasurers to be filed for public inspection until *after* the election. Manifestly much of the value of the restraint imposed upon the expenditure of money for electioneering purposes is lost if the light of publicity cannot be turned on until the election is over.

URBANA, ILL.

The Endless Quest

BY MARGUERITE OGDEN BIGELOW

Ay, rest is sweet, and pillowed ease has charms,
  Success can lull us to a vast delight,
And Victory is a lover in whose arms
  Both days gone by and days to come seem bright.
More tonic are the myriad swift alarms
  That rouse our human nature from warm night,
Stripping soft wrappings from us, lest the harms
  Of too great pleasure be the spirit's blight.
For, always, crowns are less than bravery,
  And kisses less than love, praise less than deeds;
The hero finds new flights eternally,
  The savior of the people finds new deeds:
To arms, my soul, and with a grand unrest,
Rejoice to glorify the endless quest!

SUPERIOR, WIS.

The Scourge of Cancer

BY IRVING WILSON VOORHEES, M.S., M.D.

Of the Vanderbilt Clinic, New York.

WHAT *is it?* Most diseases are symbolic of a state of warfare between invading foreign cohorts (disease germs) and the soldiers of the body (lymph cells, white blood cells, antibodies, etc.); but in cancer the battle is in reality between cells of the body intimately related—a struggle between brother and brother. And nowhere is the truth of the old saying that a man's worst enemies are those of his own household more patent than just here. Cancer occurs chiefly in middle and later life, when most organs of the body are beginning to atrophy or undergo a retrograde change in preparation for approaching old age. It represents in reality a sort of autonomy or cell anarchy, or, as one popular writer phrases it, "a treason in the body state."

Cancer frequently begins in some secreting tubule, *e. g.*, a sweat gland, the cells of which multiply until they form an obstruction to the outlet of this tubule. From this point on there is a tremendous increase of cell growth, so that a little tumor becomes visible to the naked eye if the swelling is favorably situated. This tumor, or swelling, increases rapidly in size and spreads out its tentacles in all directions. From these cells substances are secreted which act as destroyers of the healthy adjacent tissue, and hence rapid breaking down of the growth and ulceration ensue. Following this, these poisons pass rapidly into the lymph and blood streams, and hence, when this stage has been reached, the disease is most difficult to cure because it is likely to crop out in some other region of the body.

I have spoken of a tumor as simply a swelling. As such it may be either benign or malign. A wart is an example of a benign tumor, which, altho it may give no trouble for many years, may suddenly begin to grow and present all the manifestations of malignancy. Just why this occurs it is most difficult to state, and hence the origin and cause of cancer are so very baffling. There is, however, a stage which for want of a better name has been called the "pre-cancerous stage," during which the tumor is forming and before it has involved any great amount of healthy tissue or has discharged its noxious excrescences into the blood stream.

There are also varying degrees of malignancy. A type of cancer known as "sarcoma" is particularly malignant, and causes death within a very few months. Skin cancer is usually of much slower growth, healing up and breaking down over and over again, continuing its course for several years in what used to be known as a "running sore." As said before, such a condition may suddenly light up and become rapidly fatal.

These malignant growths are characterized by invasion of adjacent tissue thru extension from a common center of activity, by a tendency to recurrence at the same site after removal, by formations elsewhere (metastases), and by interference with the nutrition and well-being of the body. The new deposits are formed by a so-called "cancer cell," which is swept into the circulation and lodged accidentally in some remote part of the body. Here, curiously enough, such a cell, instead of dying and being cast off as waste, rapidly adapts itself to the new surroundings and continues to reproduce its kind in whatever situation its lot may be cast. For instance, a cell from a cancer of the intestine, when carried to the brain and deposited there, will begin to form intestinal cells, as if its purpose were to establish an accessory digestive organ in the brain substance. That is the reason why cancer is spoken of as a species of treason or cell anarchy, because to all intents and purposes it is a normal body cell in the beginning, which refuses to obey the ordinary laws of growth and becomes a giant or monstrosity, destroying everything in its pathway, and ultimately the very life of which it forms a part.

There is a progressive tendency to an increase in frequency of cancerous dis-

cases. This increase is observed in all countries, and therefore it may be inferred that the day is not far distant when the ravages of malignant disease will cause it to take first rank among fatal maladies, inasmuch as the means employed to combat it, individual as well as collective, have heretofore been unable to suppress it.

In the year 1900, 900 deaths in the United States followed cancer of the stomach alone, to say nothing of the victims who succumbed to its ravages elsewhere in the body.

It is thought that climate has a certain influence upon the frequency of this disease. Thus, low-lying, damp places near streams which frequently overflow their banks are sometimes spoken of as "cancer belts." One of these is described in Brookfield Township, Madison County, N. Y., where, in an area of 75 square miles, there occurred 84 fatal cases of cancer from 1886 to 1900. Dr. J. D. Bryant, who has occupied himself with this question, states that the mortality of cancer in 1850 was 9 in 100,000; in 1860, 11.7; in 1870, 16; in 1880, 26, and in 1890, 35.45. In 1899, Dr. Roswell Park, of Buffalo, said:

"If the same increase of mortality is maintained, in ten years from now there will be in the State of New York more deaths from cancer than from tuberculosis, smallpox and typhoid fever combined."

Until census figures are available, it is impossible to determine the correctness of these observations.

Causes of Cancer.—Altho we have complete and careful statistics from all countries of the world which seem to show the contributing causes, these are valuable chiefly as corroborative aids in diagnosis. All authors agree that cancer is most frequent in advancing years. Nevertheless, cancer, altho extremely rare, is not unknown in infants or even in the unborn child. In the intestine of a child aged four months cancerous growths have been found.

It is one of the tragedies of civilized human existence that the process of reproduction has been attended with such great mortality to the mother. We have always contended with diabetes, and kidney disease, and convulsions, and insanity, and malformations, and childbed fever, each of which has condemned full many a fond mother to an early grave. And just when we seemed to have gained some control over these, it was noticed that cancer was claiming more than a reasonable share of women who had borne children and who had suffered from infections or lacerations attendant upon this important function. The penalty of motherhood does seem at times very unjust and far more severe than the weaker sex is able to withstand.

Half of the cancer in women is in the reproductive organs and for the most part in those who have borne children. Breast cancer follows quite frequently in the old scar from a previous breast abscess or so-called "gathered breast" due to an infection during lactation. But from fifty to sixty years, which represents the usual period of beginning senility, the male is more likely to fall a victim to malignant disease than the female; and if we put aside the genital tumors, those of both sexes, we find that the mortality of males increases relatively about the age of sixty years.

Heredity has been cited as a frequent cause of cancer, but most American authors believe that it is only an accidental accompaniment and that there is no proof for hereditary or congenitally acquired cancer. They believe that in the light of our present knowledge no alarm should be felt on this score.

Diet has for many years been considered a very important factor. The vegetarians claim that cancer is due to overindulgence in meat, but it is well known that the Hindoos eat no meat, and they suffer from cancer quite frequently. Roger Williams, the noted authority on cancer, states that out of 102 cancer patients operated upon at the Jeypore Hospital up to 1888, 61 were vegetarians and 41 meat eaters. Fish eating is a possible cause, for it is known that there is a high mortality from cancer in sailors and fishermen, who subsist largely upon a fish diet, but the Bretons, who are great fish eaters, have little cancer. Uncooked vegetables, especially tomatoes, for some unknown reason are supposed to influence the origin of cancer. There is

absolutely no evidence for this assumption. Alcohol likewise has been accused, since it was noted that the Bavarians, who are great beer drinkers, die of cancer in large numbers, but on the contrary, the Mohammedans take little or no alcohol and yet have much cancer among them. Concerning this whole question, Roger Williams states that: "The ensemble of facts relating to the life history of mammary cancer patients (which may be taken as a type) shows that they have almost invariably led regular, sober and industrious lives. Persons of drunken, dissolute habits are comparatively seldom affected." This is, of course, no argument in favor of moral obliquity.

Blows (traumatism) and chronic inflammatory conditions, like irritative processes in general, are said to be sufficient cause to favor the beginning of cancerous growths. This idea has been held from the earliest times, and without going into the discussion we may note what an important role, according to almost all surgeons, injuries play among the most interesting theories of the causation of cancer.

In cancer of the lips and tongue, the frequency of which in the male has always provoked great interest, the irritative action of tobacco and decayed teeth (dental caries) influence its origin. One surgeon has collected 77 cases of cancer of the lip, in which he has always found these two antecedent agents. Of four women affected with cancer of the lip, three were addicted to smoking. Another author has established statistics of 245 cases of cancer of the tongue, the histories of which show the never-failing presence of these two agents.

Is Cancer Contagious?—In spite of the very numerous inoculations practised by different experimenters, the transmissibility of cancer from man to animals or from one animal to other animals of different species is not demonstrated, and even with the most ample information we must maintain that the transference of cancer from man to man must be exceedingly rare, if it occurs at all.

The difficulty of solving the problem has ever been one of experimentation. Several eminent surgeons, notably the lamented Nicholas Senn, of Chicago, have purposely inoculated themselves with cancerous particles, but without producing the characteristics of malignant growth. Nevertheless, in handling a cancerous patient, the ordinary methods of precaution should be taken, just the same kind of care one would use in typhoid fever or in dealing with external abscess.

Thanks to the microscope, Müller was able to show the importance of the cell and to enunciate his great law of tumor formation:

"Every tumor is formed from a tissue having its analog in the normal organism, either in the embryonic state or in the state of complete development."

The full import of this law becomes apparent when we reflect that every living thing begins its life as a single cell or unit, and body growth and maintenance depend upon the addition of other cells, which finally are differentiated to form tissues and built up into organs. The beginning of all biological science is therefore a study of the peculiarities of the cell. In view of this fact, Cornil and Ranvier, whose competence in such matters is well known, have formed their theory of malignant growth, calling it "the return to the embryonic condition." This theory figures among the most important used by scientific men in their attempts to unveil the mysteries of this dread disease.

The parasitic theory of cancer is a most plausible and tempting one, because it offers almost a parallel with the known facts concerning certain diseases of infectious origin. The enlarged glands represent an attempt to filter the offending invader from the blood by surrounding him with a myriad of hostile cells, some of which (the white blood cells, or phagocytes) throw their limbs about his body and attempt to dissolve and digest him. This is what happens in all infectious diseases of whatever kind, caused as they must be by a specific micro-organism. But in cancer of the skin, for instance, it is not the white blood cell, but the skin cell itself, which heaps up in enormous numbers, offering, however, a barrier to the outbreak of the prisoner about as effective as

would be the walls of a mud fortress against the awful power of a modern 12-inch gun. Hence the parallel is only an apparent one, and in the last analysis there is no disease which resembles cancer in its origin, course and general symptoms. The ordinary defenses of the body, which are so helpful in fighting other diseases, have little protecting influence here save in the very beginning of cancerous diseases. For the enemy is within ourselves and apparently is not introduced from without, as is true of infectious diseases in general.

If cancer were due to a parasite it might be possible to invent a serum, which, by stimulating the soldiers of the body to increased activity, would completely overcome the systemic effects of the poison generated. As the matter rests, however, no human being can withstand or recover from a cancerous invasion through the activity of his own bodily resources.*

Danger Signals.—With the knowledge of what cancer may, can and will do under certain circumstances, is it possible to prevent the disease, and if so, in what manner? The answer to this question is simply this: *The prevention and cure of cancer depend on careful attention to certain disarranged body conditions, upon early diagnosis once the disease has begun, followed by immediate operation.* It is curious how careless people are concerning certain details of their daily lives which are of the utmost importance. For example, a little lump may have been noticed in the skin for some months, a lump which is destined to show its cancerous characteristics and ultimately to cause the death of its host, but no attention will ordinarily be paid to it until it has grown beyond control. Concerning the frequency of breast cancer, any lump discovered in the breast is more likely to be cancer than anything else, if the patient be forty years of age or over and has borne children.

The danger signal in breast cancer is any small lump accidentally discovered which gives absolutely no symptoms and does not inconvenience the patient in any way whatsoever. This shows how insidious cancer is; how it begins without any manifestation, such as pain, which might call attention to its presence, and how it grows rapidly and quietly until its poisonous elements have passed into the blood stream to be deposited elsewhere in the body.

Do not ask advice of some friend, whose chief title to distinction consists in perverse willingness to impart knowledge she does not possess, for the advice will invariably be: "Don't go to the doctor; he will tell you you have cancer." Remember that playing with fire of this sort is like carrying a lighted candle into a powder magazine. If the physician is a careful and conscientious practitioner he will examine the parts affected in a strong light and will remove a specimen for microscopical diagnosis. If it is not cancer, then you will have the satisfaction of knowing that you are safe. If it is cancer, you may be cured by operation.

Cancer of the mouth begins as some little sore that does not readily heal up, or heals up only to break down again in a few days. Now if this sore is opposite the root of an old tooth, or if it is on the lip, where the pipe or cigar subjects it to constant irritation, this fact is exceedingly suggestive of cancer, and you should not be satisfied with anything short of the best medical opinion that can be had.

Cancer of the throat is frequently ushered in by hoarseness and loss of voice. So also is acute laryngitis, but this latter condition will clear up in two or three weeks under proper treatment, whereas a malignant condition will become worse as the days go by. Careful examination by a skilled throat surgeon will determine the seriousness of the condition.

Cancer of the stomach and bowels is relatively frequent. Attacks of indigestion with sick stomach, vomiting, loss of appetite and of strength and weight may not be due to cancer, but one should, nevertheless, subject himself to repeated examination by all known methods in order that diagnosis of malignancy may be made at the earliest possible moment.

Public knowledge of cancer is not of its primary stage, but of its terminal ap-

*Since the above was written the researches of the late Dr. Hodenpyl at Roosevelt Hospital tend to show that in very exceptional cases cancer may undergo spontaneous cure.

pearance, when all hope is forever gone. The sunken cheek, the hollow eye and wasted flesh, the loss of appetite and strength, the pain, the restless nights and the hopeless days—these are all fully known, but at this stage little can be done to relieve the sufferer and absolutely nothing to save him from death.

It should be remembered that all cancer begins as a benign growth and that there is, therefore, a true pre-cancerous stage, in which it is possible to save the life of the person affected; that growth and extension of this tumor take place thru the blood and lymph channels, and that general malnutrition and decreased vitality favor rapidity of local extension and the development of foci elsewhere in the body.

Four-fifths of all cancers occurring in the body are located where diagnosis and operative interference are possible. As a general maxim it may be said that every case of cancer which occurs in a part of the body accessible to successful removal is curable. Thus, one surgeon has shown that 50 per cent. of two hundred cases operated upon by him were alive and well six to thirteen years afterward, and that of one hundred consecutive cases, twenty-six had no recurrence from three to twenty years following operative removal of the growth.

Concerning methods other than surgery it is scarcely necessary to speak here, for that is a matter which may be left in the hands of one's own medical adviser. The consensus of opinion among the world's greatest physicians is that X-ray, electricity by the high frequency current, the leucodescent light, radium, the antitoxines of certain bacilli injected into the body, the serum methods of treatment, and the use of trypsin and amylopsin, are in many cases not only absolutely useless, but dangerous, inasmuch as they influence the patient to put off a dreaded operation which might cure within a reasonable length of time. The ligation of blood-vessels supplying a growth, first advocated by Dr. Dawbarn, of New York, is applicable to inoperable cases only. It should never be done as an "early" operation. If X-rays are to be used they should be applied after operation to prevent a recurrence, rather than before operation. Of course some cases of cancer are necessarily inoperable from the beginning. For instance, in the very aged, in patients with very bad lungs, heart or kidneys, who could not withstand an anesthetic, and in those very advanced cases which have not submitted themselves for early diagnosis. Here the use of pallative methods is in order. Patients are beginning to learn the necessity of consulting their physician and securing an early diagnosis. Hence we are now doing an adequate operation in a case less advanced than formerly, but our final goal must be an adequate operation in a very early stage of the disease. The delay is entirely a matter which rests with the patient. Many cases, seen in private practice, after being informed, let us say, that they have cancer of the tongue, will tell the physician that they had noticed "something wrong" from six months to one year, but did not think it worth while to trouble the doctor about it. They ought to have known that that is what the physician is for. If he is the proper sort of man, one worthy of their confiding trust, he will never laugh at their fears, which may have a rational and true basis.

In the light of our present knowledge, one may conclude that cancer is relatively preventable if all sources of body irritation are removed just so soon as they appear, such as decayed teeth, the use of pipe or cigar, etc., and if the general health is kept at par or above. In case, thru some oversight or neglect of these precautions, a small tumor, so small as to be almost insignificant, is found, it can, at this stage, be absolutely cured, and a recurrence in all probability prevented. This is the chief hope which medical science at the present time offers, and it is not too much to say that when people become fully aware of this great possibility the number of lives saved will exceed those now being saved daily thru measures of warfare so successfully waged against the "great white plague."

The Passing of Persia

BY HERBERT ADAMS GIBBONS

THE note of the British Government to Persia, threatening to occupy the southern provinces of the Persian kingdom if order is not restored before the end of the year, marks an epoch in history. Persia is the only kingdom mentioned in the Bible which is today an independent political entity as it was twenty-five centuries ago. It has suffered the successive domination of Alexander and the Seleucids, the Parthians, the Arabs, the Tartars and the Turcomans, but since 1497 has maintained its independence with only one dynastic change. In 1779 the Sofis were displaced by the Kadjars, to which family the present Shah belongs.

Since the days of the Arab domination the Persians have been Schiite Mohammedans, attached to the descent of the khalifate thru Ali. For this reason they were formerly regarded as worse than infidels by the orthodox Sunnites. They have had to struggle desperately against the territorial aggressions of the Ottoman Turks and their Arabian allies, and succeeded where the Byzantine Empire and Egypt failed. In 1832 Russia "annexed" the northern frontier provinces of Persia. Since that time the ancient kingdom of the Zoroastrians has been saved from Russia by England, and from England by Russia. Now that these two rivals have come to an agreement in their Asiatic policy, one can foresee the passing of Persia.

There can be no question of the sincerity of the Anglo-Russian accord. Russia came to realize her limitations in the bitterness of the Japanese War, and England hers in the wave of sedition against which she must continually contend in India and Egypt. The "spheres of influence" (to use that euphemistic expression which is generally a prelude to absorption) of the two Powers are clearly and naturally defined. The British must keep their preponderant position on the Persian Gulf and the Indian frontier. The Russians need the provinces of the north and northwest, from the Caspian Sea to Kermanshah, in which region they have invested $100,000,000. If any outside influence was needed to hurry and cement the accord, it was found in the Bagdad Railway scheme, and in the remarkable commercial and political activity of Germany in Persia during the past five years.

During the summer of 1907 the foreign offices of London and St. Petersburg came to an understanding on the Persian question. They saw clearly that the conduct of the Shah was leading to revolution. In September of that year the first step was taken when Russia warned the Shah and his Council that the troubled political condition of Azerbaidjan[1] would lead to armed intervention. At this time the first *coup d'état* occurred, and the two Powers endeavored to reconcile Mohammed and his parliament. When the Shah forcibly suppress parliament on June 23, 1908, Sir Edward Grey declared that there was a "sincere desire on the part of Russia and England to intervene as little as possible in Persia, so long as their subjects would not be in danger."

This second *coup d'état* came at an unfortunate time. Only a month later the constitutional regime was declared in Turkey, a neighboring and a Moslem power. This gave new heart to the Nationalists, all Northern Persia rose in revolt, and the troops of Ahmed Daouleh bombarded Tabriz at the end of August. Business was paralyzed; international commercial interests were jeopardized; the lives of foreigners were endangered. In vain England and Russia pleaded with the Shah to reconcile himself with his subjects and to fulfil the promises that he had made. Everything pointed to foreign intervention in November, 1908. A good opportunity was given in a remarkable appeal of Persian merchants addressed to foreign houses with which they traded, setting forth the intolerable state of affairs, and soliciting their good offices to secure intervention!

All during the winter of 1908-1909

[1]The northern province of which Tabriz is the capital.

the two Powers waited patiently for the Shah to re-establish the Constitution. Russia massed troops on the Persian frontier. In the British House of Commons this action on the part of Russia was warmly defended by the Foreign Secretary. On February 17, 1909, King Edward said in his discourse from the throne: "The present troubles in Persia put in danger the numerous commercial and economic interests which Great Britain and Russia have in that country; the two governments are now exchanging views on that subject." In the debate on the address, Mr. Asquith told the Commons that "England and Russia are entirely in accord on the Persian question."

The obstinacy of the Shah and the ever-increasing violence of the revolutionary movement hastened the carrying out of the program agreed upon. General Snarski invaded Persia from the north, while British marines were disembarked at Bushire. This move forced the Shah's hand. He re-established the Constitution. The revolution for the moment collapsed. England withdrew her sailors and Russia a part of her Cossacks. No European Power had protested. Indeed, Prince von Bülow had declared before the Reichstag on March 29, 1909:

> "There is no reason for our opposing the Anglo-Russian accord, which respects the independence and integrity of Persia as well as the principle of the open door. If England and Russia have intervened in the internal affairs of Persia, we have recognized on our part that these two countries have for territorial reasons a particular interest in the maintenance of order and tranquility in Persia."

In April, fighting was renewed between the reactionaries and the Nationalists, in which a young American teacher was killed. Persia continued to be in a state of war. It was necessary for Russia—and this fact was recognized by all the Powers—to occupy the provinces where disorder reigned and maintain a garrison in the capital, for the protection of foreign subjects and foreign interests.

After the fall of Shah Mohammed Ali the situation became very delicate and has remained so ever since. On the 16th of July, 1909, the twelve-year-old son of the fallen ruler was proclaimed Shah, under the regency of a prince of the royal house who had received an English university education and was thoroly *en rapport* with the Western world. The Nationalists had triumphed on the surface. The Russian occupation immediately came to be regarded as an oppression, and unthinking enthusiasts in America and Europe, imperfectly informed as to the real state of affairs in Persia, began to show a dangerous sympathy for "the downtrodden Persians." A "Young Persia" party came into power, full of enthusiasm and lofty ideas, and just as ready to pluck the fruit before it was ripe as the Young Turks have been. Just before parliament convened, Rahim Khan raised the banner of revolt at Ardebil, and it was only the arrival of new contingents of Cossacks that saved the day for the Government. In spite of this fact, which demonstrated that the withdrawal of the Russian troops would have been followed by an irresistible reactionary movement, at the opening of parliament on November 15, the Regent was forced to speak in the discourse from the throne of "the sadness caused to the population of Persia by the presence of foreign troops."

That was in 1909. Ever since then the Russians have remained. There is no time that they could have withdrawn without thereby throwing Persia into a state of anarchy. What has the Government done to hurry the Russian evacuation? Nothing. Since the Russians came, the people who form the real backbone of Persia and by whom its regeneration must come, have had for the first time in their lives a taste of the reign of law and order. Never will they be content to return to the conditions of former days. The Government has organized no gendarmerie worthy of the name. It has not even tried to police adequately the larger cities. In the southern provinces, where there are no Russians, conditions have become intolerable. So, in presenting the ultimatum, England has merely put a limit to her patience.

The impotence of the new so-called "constitutional government" to preserve order has only been equaled by its blind refusal to fulfil the conditions under which it could procure the necessary finances for the regeneration of Persia. At the beginning of last year the Gov-

ernment had $30,000,000 of foreign and $5,000,000 of internal obligations to meet during the year, with only $15,000,000 of revenues in sight to effect that purpose. England and Russia were quite willing to come to the relief of the Government to the extent of $50,000,000, imposing conditions which, under the circumstances, could not be regarded as unreasonable. Here are the conditions:

1. Program of expenditures to be submitted to the British and Russian legations for approval, and the execution of the program watched over by a commission composed of four Persians and two Frenchmen in the employ of Persia.
2. Seven French financial advisers to be employed by the Government.
3. England and Russia to have the right in their respective zones to first choice of railway concessions.
4. Russia to have the monopoly of navigation on Lake Urmia.
5. The organization of the gendarmerie for the protection of the commercial highways to be confided to foreign officers in the pay of Persia.
6. The interest on this debt to be extracted from the first customs receipts of every year.

These conditions were indignantly refused. Persia, altho unable to borrow money as a business proposition on any terms, saw in the Anglo-Russian offer an "attack upon the independence and dignity of the glorious monarchy of the Sofis." The Young Persians began to negotiate with Mr. Sayed Ruete, representative of the Deutsche Banke, for the floating of a loan in Germany. It is supposed that the Government was even ready to make secret promises of railway concessions to German capitalists.

On August 7 the German Minister in Teheran, Herr Quadt, became unfortunately involved in the revolt of Sattar Khan and other Nationalist chiefs who resisted the decree calling for a general disarmament. I have gone carefully into the various reports of this event, which has so agitated diplomatic circles and has been so roundly denounced by the British, Russian and French press. I think that the action of the German Minister has been exaggerated and misrepresented. But, following upon the attempt to float a loan in Germany, and the rumors of railway concessions to Germany, it has undoubtedly influenced the two interested Powers to act quickly.

The Regent, upon whom the last hopes of the conservative elements of the nation were based, has died without leaving any one to succeed him. The new Shah, as we have mentioned above, is a little child. The state is bankrupt. There is no army. There is no police system. The conditions of the British ultimatum cannot be fulfilled. England and Russia will remain firm. Their political and financial interests will not allow them to recede from the position which they have taken. However one's natural sentiment for independence would lead him to sympathize with the aspirations of "Young Persia," one may rest assured that the permanent occupation and direction of the country by England and Russia means the beginning of an era of prosperity and of true freedom, such as has followed the British occupation in Egypt.

CONSTANTINOPLE, TURKEY.

Mater Dolorosa

BY NICHOLAS SMITH

AN empty nest up in the maple swings;
An empty heart is waiting at the door;
The wrens will come, but oh, the summer brings
To these sad arms their nestling brood no more

With me in tragic chorus all things weep;
The waves dash faint and sobbing on the shore;
The rainy skies their days of mourning keep
Because of death and them that are no more.

The vestal Autumn wandered musing by,
Telling her beads with tears, and woe is me!
The maniac wind raves wild; O hear it sigh
And mutter of my great calamity.

Speak to me, pear and apple tree,
Of April's immortality!
Prophetic from thy funeral pyre,
Declare, O dying western sun,
With thy ten thousand tongues of fire,
To-morrow's resurrection-morn!

NEW YORK CITY.

LITERATURE

The Cambridge Modern History

THE great Cambridge Modern History is at last done, except for charts and indices* Fifteen years ago the Syndics of the Cambridge University Press decided that the time had come for the publication of a monumental history of modern times written by specialists in various fields and based upon original sources or authorities of highest rank. The working out of the general plan into details was committed to the care of the most erudite man in all England, Lord Acton, Regius Professor of History at Cambridge University, and with great enthusiasm he set about his appointed task—dividing and subdividing the field and finding for each part the man who knew it best. Unfortunately, Lord Acton died before the actual publication was far advanced, but his plans were fairly rounded out and the work was readily carried forward by a board of three able scholars, Dr. A. W. Ward, as editor-in-chief, Prof. G. W. Prothero and Mr. Stanley Leathes, to whom the completion of the undertaking was entrusted. Under these high auspices the first great co-operative history in English has been brought to an end (except for the maps and index) in the volume bearing the title *The Latest Age*—covering principally the period since the Franco-Prussian War. The whole work, which brings under survey the world since the Renaissance, is divided into twelve stout volumes of approximately a thousand pages each: *The Renaissance, The Reformation, The Wars of Religion, The Thirty Years' War, the Age of Louis XIV, The Eighteenth Century, The United States, The French Revolution, Napoleon, The Restoration, The Growth of Nationalities*, and *The Latest Age*. It is thus apparent that each volume is devoted to a period of years, but considerable freedom has been given to the several contributors to run forward or backward as the exigencies of continuity required. Within the limits thus somewhat roughly set each volume is laid out into divisions referring to separate countries or special topics which are treated by the specialists deemed by the editors best qualified to deal with the themes assigned them. A veritable host of eminent scholars drawn from every portion of the world has been drafted into service, so that what we have is a high grade encyclopædia of history done in a chronological rather than alphabetical order.

As might be expected, there are wide differences in methods of treatment, style and firmness of touch. There are occasional chapters of engaging elegance and fine critical writing and there are others that do not rise to the level of high school textbooks. As a whole, the work is done in straightforward pedestrian prose—somewhat in the nature of a German Geschichtskalendar—accurate, informing, but seldom moving or illuminating. The body of the story is a political record written principally from state papers and diplomatic notes. The few chapters on social, economic and literary themes do not relieve the steady tedium in the flow of political narrative. Evidently "the Cambridge Modern" is a thoroly conventional piece of historical construction, conceived and completed after the fashion of historical writing that has prevailed in England since the age of chronicle making. The doings of kings, warriors and politicians are set down with a fairness and fulness that is almost painful—sometimes there will be twenty or thirty proper names and as many dates on a single page. Obviously this is no work for one who wants his history written with the swing of Michelet, Macaulay, Taine, or Green; but whoever has need of accurate data on political events for the last four hundred years will find this set of books as indispensable

*THE CAMBRIDGE MODERN HISTORY. Volume XII. The Latest Age. New York: The Macmillan Company. 1910. $4.

as his coat and hat. It matters not whether it is Wolsey or Bismarck, the Thirty Years' War or the Russo-Japanese War, St. Bartholomew or Bloody Sunday, Grotius or Karl Marx—the searcher for facts will find in these myriad pages sound and pertinent information, and in the ample bibliographies guidance for research during the remainder of his days (and mayhap afterward). There is nothing comparable to it in English; no student of affairs can do without it; and we shall never need another like it. Of course one could find plenty to criticise in detail—for example, the separation of the history of the United States from the rest of the world and its segregation in a single volume so that scarcely a word about this "world power" appears in the volume on *The Latest Age,* or the exasperatingly brief and unsatisfactory account of the last twenty years in Germany—but such criticism once begun could hardly be stopped. Man is fallible—and so is a board of editors. Our surprise is not at the shortcomings but at the excellences of the undertaking as a whole. The work is certainly not *Caveat Emptor.*

And now something about the volume before us—*The Latest Age.* It is done after the fashion of the others. In twenty-six chapters the nations of the earth (except the United States) are treated by specialists—France by Emile Bourgeois, Germany by Hermann Oncken, Italy by Thomas Okey. Then there are several additional chapters on particular themes: one on the foreign relations of the United States (singularly meager and fragmentary), another on international law and the peace movement by Sir Frederick Pollock, another on social movements by Sidney Webb, a fourth on the scientific age, a fifth on modern explorations, and a concluding analysis of progress in historical writing during the nineteenth century. Then there is a measured characterization of our age by one of the three editors who have followed with such care and fairness the long train of events from the renaissance to the discovery of the North Pole:

"The age has been prosaic and unromantic; the enthusiasm for the mechanical and scientific triumphs of the early Victorian period has somewhat faded; the belief in constitutional government and universal education as a remedy for all political and social evils has been shaken; the blots on our economic and moral order have been relentlessly brought to light; self-complacency is no longer fashionable. . . . The zeal of the young and ardent is thrown into schemes of social regeneration. . . . The belief in the possibility of social reform by conscious effort is the most dominant current in the modern European mind. . . . Its substantial achievements and perhaps its disappointments are in the future; but its currency in the present is as significant and as pregnant as belief in the Rights of Man about the time of the French Revolution. The coming age will be occupied by the attempt to translate its ideals into the phrases of practical politics."

The Future of Trade Unionism and Capitalism in a Democracy. Two lectures given at Kenyon College. By Charles W. Eliot. New York: G. P. Putnam's Sons. $1.

The Conflict Between Individualism and Collectivism in a Democracy. Two lectures given at the University of Virginia. By Charles W. Eliot. New York: Charles Scribner's Sons. 90 cents.

Dr. Eliot is the Nestor of Individualism. To him the political philosophy of an earlier generation is still vital, the doctrine of Herbert Spencer almost infallible. Personal freedom and the beneficence of competition are his watchwords. His fidelity to a few first principles and the calmness of temper fostered by decades of academic repose give to his utterances the clarity and certitude as well as the coldness of a mathematical demonstration. He appraises trade unionism and capitalism, points out where each curtails individual freedom and forecasts how each must adjust itself to the needs of a democracy. He has a horror of monopoly; but, while inveighing at length against the monopoly of labor that trade unions aim to establish he says little against the capitalistic monopolies that control so much of business. He even lays it as a democratic duty upon employers to fight against the closed shop, the limitation of apprentices and the union label, tho he is dumb about the evils of Beef Trusts and oil companies that close the shops of competitors, limit output to maintain prices and utilize patents and copyrights far more exclusive than any union label. Yet he realizes that trade unions will persist. He would even encourage them—with claws clipped and teeth drawn. In forgetfulness of the fact that over sixty per

cent. of the adult wage-earners of the nation receive less than $600 a year, he thinks that "high wages and short hours have been secured." Therefore strikes are unnecessary and publicity will "accomplish all reasonable ends which trade unions have proposed for themselves." A truly Utopian forecast! At the same time, however, Democracy will require the capitalist to "invent the means of giving varied and progressive work to the individual workmen" and to "take thought for the means of providing their workmen with permanent homes which are not only wholesome, but cheerful and suitable for the bringing up of a family." Where a single factory controls a village this is possible, but, in a city, however much thought an employer might give to the housing question, he would find the task of supplying dwellings for his workpeople and keeping them in his houses to be insuperable. Only community action, which can affect all the dwellings the workers may occupy, can grapple with the problem and to such "socialistic" effort Dr. Eliot's creed is opposed. His aim and his doctrine are at hopeless variance. In education Dr. Eliot is more inclined to extend the scope of collectivism than in the industries, altho he lays emphasis upon the right of the individual to choose his studies and profession. He commends manual and occupational training and the prolongation of educational opportunities thruout life.

Denry the Audacious. By Arnold Bennett. New York: E. P. Dutton & Co. $1.35.

Mr. Bennett is our most unreliable author. You never can tell what he will do next. Sometimes he writes like George Moore, sometimes like De Morgan, more times like nobody but himself. Just now, when we are all anxiously watching for the second volume of "Clayhanger," to find out why the heroine married the wrong man first, here comes quite another story; of the Five Towns, it is true, but not dealing with any of our old friends, except Sillitoe, the tailor. The population of the Five Towns is greater than we had supposed. But if we cannot tell what a book by Bennett is about, we are always sure it will be interesting. This one catches the reader by the first line: "Edward Henry Machin first saw the smoke on the 27th of May, 1867, in Brougham St. Bursley, the most ancient of the Five Towns." The story is quite *à la mode*, in the style of "Get-Rich-Quick Wallingford," a glorification of the unscrupulous.

The Broad Highway. By Jeffery Farnol. Boston: Little, Brown & Co. $1.35.

When this romance was published a few weeks ago in England the high praise accorded it by the English press aroused some expectation preceding its publication here. Now that our curiosity has been satisfied and we have experienced several hours of keen enjoyment in gazing thru the author's eyes upon picturesque scenes in rural England, in listening to the quaint and humorous conversations among the various characters that frequent "the broad highway" leading down from London into Kent, and withal in following the adventures, fortunes and misfortunes of that pedantic hero, Mr. Peter Vibart, we are ready to add our word of commendation and give hearty welcome to Mr. Farnol as a writer of merit, a careful observer of life, and a romancer with humor, imagination and delicacy of feeling. One reads but a little way before he feels the charm of the author's fresh, unaffected, vivid style. Mr. Farnol has a genuine love of nature and a place in his sympathy for all sorts and conditions of men, who drop into his story in á natural, easy-going way which comports well with their peculiarities and manner of life. There are, to be sure, impossible situations, evident anachronisms, and some doubtful sequences, such as rain and "a smother of mud" in the forenoon and a "dust cloud" in the afternoon. The heroine is a somewhat elusive character, appearing only in the second part, and it seems probable that the reader will have as little understanding of her as the hero himself in his most perplexed moments, yet her attractiveness for either reader or hero is not lessened by this sense of mystery that surrounds her personality. The deftness and delicacy with which the author manages the embarrassing relations into which hero and heroine are thrown fully match the daring which proposed such a hazardous situation in the story's plot.

Louise Chandler Moulton. Poet and Friend. By Lilian Whiting. Boston: Little, Brown & Co. $1.50.

Mrs. Louise Chandler Moulton was seventy-three when she died, in 1908. She was born in Pomfret, Conn., and was still living there when, at eighteen, she published her first volume, called "This, That, and the Other"—a volume of short stories and papers which soon reached a sale of 20,000 copies. The book at once gave her rank among clever and promising writers. It was praised in the *North American Review,* and the praise was echoed in all good journals of criticism. "Beautiful and interesting," Mr. Stedman said of her, being then himself a youth of not far from her age—"Her manners are in marked distinction from the forwardness of the strong minded woman of the day." "Overflowing with genius and promise," said Mr. Epes Sargent in the Boston *Transcript* of that day. At twenty she was a wife, and living from that time in Boston. Thereafter she had fifty good years of literary activity; produced abundant verse and prose, preserved in many volumes. She was one of the first women to drop the stilted style then in vogue at home and across the water. She wrote with grace, beauty of form, a growing artistic sense; exprest with charm the emotional spirit, the higher passionate spirit of the feminine mind, with an unreprest freedom such as had not yet found its way into the literature of chilly Boston, where, as a recent writer expresses it, "respectability stalked unchecked." It was not then common in Boston to find open admirers of Poe, Swinburne, Walt Whitman, the Rossettis, the Mallarmés. There were some who tried then or thereafter in a benvolent way to admire them all, but for the most part failed. Mrs. Moulton admired and did not fail. She never went back to the wholly "unchecked" period, but continued to love the more ardent lovers of intellectual liberty, to find joy in the freer flights of song. Her early poems were her best. Others came, more finished, polished, less redundant in unexpressive terms. The music was finer, but the emotion was hardly more true to nature. There were more felicitous phrases, but some thought they discovered a quality that was reminiscential of feeling rather than true feeling.

The Andersons. By S. Macnaughtan. New York: E. P Dutton & Co. $1.25.

Once more does the author of "A Lame Dog's Diary" and "Three Miss Graemes" tell the outside world something about Scottish folk—in a novel. There is an heiress and an impecunious gentleman and a Scottish physician, and over these and other characters the author throws the spell of pleasant humor. But the novel remains slight in everything but length: which last is of 372 pages.

Literary Notes

....Josephine Daskam Bacon returns to the child-novel in her narrative *While Caroline was Growing,* just published by Macmillan.

....Prof. J. H. Hollander has made a study of the life, works and influence of *David Ricardo,* which is published by the Johns Hopkins University Press.

....Allen French is well qualified to describe *The Siege of Boston* (Macmillan; $1.50). His book is well illustrated and, while frankly aimed at the larger public, is not without historical value.

....Charles G. D. Roberts is an indefatigable biographer of the wild world, and in his latest volume, *Neighbors Unknown* (Macmillan; $1.50), maintains his reputation for readable and vigorous nature fiction.

....E. W. Hornung's most recent exercise in fiction is entitled *The Camera Fiend* (Scribner; $1.25). This, too, is a detective story, but the "love interest" is not neglected, either. And Mr. Hornung is invariably entertaining.

....*Poetical Favorites—Yours and Mine,* by Warren Snyder (Wessels & Bissell Co.; $1.25), is an anthology of verse chosen from the collector's own scrapbook as well as from familiar poets. The result is a certain unevenness that will doubtless attract some readers.

....*The Christ Child in Legend and Art* (Dodd, Mead & Co.; $1) is made up of prophecies, stories and hymns, illustrated by a goodly number of pictures taken from the works of well known artists.

....George H. Doran Co. import a series of books for Lenten reading, all of them most attractive in letter press: *Easter in the Heart, Lent Lilies* and *Easter Bells,* anthologies of verse and prose, and *Thomas à Kempis* and *St. Francis of Assisi,* by May Byron.

....The Griffith & Rowland Press has issued *The Gospel at Work in Modern Life* (50 cents), by Robert Whitaker, for use in young people's societies. It consists of a dozen lessons applying the gospel to various phases of life, such as home conduct, social betterment and business.

....The twenty-fourth annual report of the Commissioner of Labor (Washington: Government Printing Office) has for its subject *Workmen's Insurance and Compensation Systems in Europe.* Volume one runs to 1,493 pages, and examines Austria, Belgium, Denmark, France and Germany.

....Omar has had many translators, but this time he is translated into English by a fellow Persian. Isaac Dooman renders the quatrains, and adds a critical introduction; Richard G. Badger does the publishing. ($1). Poetically, Fitzgerald and even some of his imitators, remain untouched.

....Bobb and Betty visit Uncle John and E. Boyd Smith describes the visit in *The Farm Book* (Houghton; $1.50). The pictures here are done in color, but unusual restraint is used, as we must confess in comparing them with other recent publications. *The Farm Book* is intended for children of ten years or thereabouts, and should prove both entertaining and instructive to the city bred.

....George Gibbs offers as his latest novel *The Bolted Door* (Appleton; $1.25). The frontispiece here is in the new style which we have observed in certain other recent novels; there being no margin whatever. The effect is, on the whole, displeasing. The novel itself is of the familiar Gibbs type; between spriteliness and froth. The scene is New York City and the dialog of the explosive variety.

....What is probably the largest book order ever placed is that which the American Bible Society and Thomas Nelson & Sons have just received from the Gideons, the national association of Christian Commercial Travelers. One hundred thousand Bibles are called for. Twenty-five thousand of them are to reach San Francisco in time for the Triennial Convention of the International Sunday School Association, in June. Twice as many more are to be distributed in New York hotels next fall.

....We learn from the Odessa letter to the London *Standard* that 29,057 new books were published in Russia last year, against 26,103 in 1909 and 22,998 in 1908. Formerly most of the new books were detective stories, but these have given place to translations of the most shady class of French productions, which find a wide circulation among the youth of both sexes. Instead of idly deploring this "degradation of literary taste" in the young and intelligent generation the censor would surely do better, says the correspondent, "to place his official veto on such poisonous prints." Herbert Spencer and Conan Doyle are the English favorites.

....In our London letter, we recently published Mr. Justin McCarthy's praises of a book by Redfern Mason, *The Song Lore of Ireland.* This book is published by Wessels & Bissell Company ($2). "From the cradle to the grave, the Irishman's life is set to music," says the author; who tells of bards and minstrels; songs of faeries, of chivalry, of Gael and Gall; also of more modern music—with frequent notation and not without quoting a goodly number of Irish songs and ballads. It is a learned work and a welcome one.

....Antonio Fogazzaro, the Italian novelist, was born in March, 1842, so that at his death he was within a month of sixty-nine years of age. His novel, *The Saint,* remains the most discussed of modern Italian literature. A lawyer, a poet, and a statesman, as well as a writer of fiction, Fogazzaro's frankness in dealing with religious problems led to the placing of his best known writings on the Index, altho from first to last he was a loyal member of the Catholic Church. His latest novel, *Leila,* has already been discussed in THE INDEPENDENT.

....To John Galsworthy's play, "Justice," was attributed the recent reform of certain abuses in British prison administration, by Mr. Winston Churchill. The London *Evening Standard* is moved thereat to say:

> "Hitherto the novelist has been the public champion of reform; the dramatist, in England at any rate, has effected little. Charles Dickens and Charles Reade wrote sometimes with a purpose, and Mrs. Beecher Stowe in her best known book wrote with nothing but a purpose. In their day the novel was a tremendous instrument for social good. Yet it did not affect the people so immediately nor perhaps on the whole as forcibly as the play is capable of doing. Mr. Galsworthy has won some of the points for which he contended in a remarkably short time."

....The English near-equivalent of *The Ladies Home Journal* (entitled, *The Gentlewoman*) repeats a story told by Tennyson to illustrate the thoughtfulness of Queen Alexandra. The Poet Laureate was one of many celebrated persons who were accompanying Mr. Gladstone on a sea-voyage. Tennyson read "The Grandmother" on board because the Princess of Wales asked for it. "I read it," said Tennyson, "in a cabin on deck. The Princess sat close to me on one side and a young lady whom I didn't know on the other. The wind came thru an open window and the Princess whispered: 'Put on your hat,' but I demurred. She said again, 'Oh, put it on!' So I did, and I heard afterward that the King of Denmark's court fool, who was in the back-

ground (they really kept a court fool) remarked: 'He may be laureate, but he has not learned court manners.' When I was done the ladies praised me, and I patted the unknown one on the back by way of reply, and presently I found out she was the Empress of Russia."

....The late Alexander Maclaren, of Manchester, was long regarded as the greatest of English preachers. His expository style, his simple, direct English, and his broad, human sympathy combined to make his published sermons as widely read as his spoken word was appreciated. One of his ardent admirers, Rev. Francis E. Clark, has collected from Dr. Maclaren's writings a large number of extracts, which have specially appealed to him during several years' reading, and has published them, prefaced by a sketch of the author's life by Rev. F. B. Meyer, under the title of *Similes and Figures from Alexander Maclaren* (Revell; $1). Pulpit speakers might well read the book as an exercise in English style.

....In his introduction to the translation of Marguerite Audoux's *Marie-Claire* (Doran; $1.20), Arnold Bennett flatly contradicts the "Parisian rumor . . . that she [the novelist] was actually helped in the writing by her admirers"— Philippe, Jourdain, Marcel Ray, Gignoux, etc. "The rumor is worse than false—it is silly. Every paragraph of the work bears the unmistakable and inimitable work [*sic*] of one individuality." M. Bennett graphically describes the way in which *Marie-Claire* has been "floated" (he actually borrows the Wall street term!) He also sums up the critic's case in these words:

"It makes no sort of pretense to display those constructive and inventive artifices which are indispensable to a great masterpiece of impersonal fiction. It is not fiction. It is the exquisite expression of a temperament."

The English translation is the creditable work of John N. Raphael.

....The well known archeologist and excavator of Egyptian and Palestinian ruins, Mr. W. M. Flinders Petrie, now enters the field of New Testament criticism with a small volume on *The Growth of the Gospels as Shown by Structural Criticism* (Baker & Taylor Co.; 90 cents). Dr. Petrie claims for his method of "superposition" that it is entirely impersonal and avoids the errors and uncertainties which are inherent in the "literary and subjective" method heretofore dominant. Perhaps it is sufficient to point out that this "new method" leads in the case of the Synoptics to the determination of a "nucleus" and five other "documents," which last are credited with containing or being "accretions," representing different periods in the growth of thought. This would certainly be "interesting if true," but the evidence adduced is not very convincing. Dr. Petrie prints the "documents" in a long appendix.

Pebbles

THE English class took up a new classic Tuesday, Shakespeare's "Mac Beth."—Pleasanton (Kansas) *Enterprise.*

"A SENATOR, Pa——?"

"A Senator, my son, is very often a man who has risen from obscurity to something worse."—*Life.*

"THESE stocks of yours are worthless."

"I don't care," said the woman. "The broker is very accommodating. He has exchanged them four times."—*Exchange.*

"FINE old inn, sir," commented the host. "Everything in this house has its story."

"I don't doubt it," remarked the grouchy tourist. "And is there any legend connected with this old piece of cheese?"—*Kansas City Journal.*

"IT must be very consoling to you," we say to the bereaved lady, "to have that splendid phonograph record of your late husband's voice. It is so absolutely natural, too."

"Ah," she sighs, "it is like, and yet so unlike, poor dear Henry."

"Unlike?"

"Yes; it talks right ahead in his tone, but it never stops when I interrupt it."—*Chicago Post.*

"JOHN dear," said Mabel, as her lord and master entered the house, "I've just had a letter from mother, and she is coming to visit us. It is a pretty expensive trip for little Muddy, and I wondered if we couldn't help her out a little."

"Of course we can," said John, giving his wife a generous kiss. "Just you write and tell her that I'll be only too glad to pay for her railroad ticket back home again as soon as she decides to go."—*Harper's Weekly.*

THE *University Correspondent* has collected the following new and highly original information from English examination papers:

The Pyramids are a range of mountains between France and Spain.

Monsoons are fertile gorges between the Himalayas.

When England was placed under an interdict the Pope stopped all births, marriages and deaths for a year.

Isinglass is a whitish substance made from the bladders of surgeons.

The line opposite the right angle in a right angled triangle is called the hippopotamus.

Liberty of conscience means doing wrong and not worrying about it afterward.

The German Emperor is called the Geysir.

John Burns was one of the claimants to the throne of Scotland in the reign of Edward I.

"Mute inglorious Milton" was an epitaph used by a writer who was envious of Milton being Poet Orient.

Queen Elizabeth rode a white horse from Kenilworth through Coventry with nothing on and Raleigh offered her his cloak.

Ben Jonson is one of the three highest mountains in Scotland.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Promise of Universal Peace

THE great event of the week, we may say of the year, has not been the bungle on the Mexican border, of which we do not yet know whether it is a warning, a war-threat, a war-play or a frontier-guard, but it is the declaration, by the voice of their rulers, of the two greatest nations in the world, that there shall never on any pretext be war between them, and the assurance which follows that what they have said the other nations of the world will say a little later. Thus the cause of universal peace makes splendid progress. It is the morning hope of the world.

Observe the steps in this progress. In 1897 the Olney-Pauncefote treaty was negotiated but lost by three votes in the United States Senate. The time was not yet for confidence. The Senate was afraid to accept with trust a treaty which would automatically provide for arbitration. A few years later Secretary Hay renewed negotiations, but it was still too soon, and his proposals were withdrawn. Then Secretary Root negotiated a treaty yielding to the Senate the right to approve each case as it might arise, but with what are called "vital interests" excluded. But that evades the real difficulties, for who shall tell what are vital interests, or, rather, what interests will not be vital in a time of passion?

So matters stood until in March of last year President Taft took a great step forward. In a public speech he said:

"I have noticed exceptions in our arbitration treaties as to reference of questions of honor, or national honor, to courts of arbitration. Personally, I do not see any moral reason why matters of national honor should not be referred to a court of arbitration any more than matters of property or matters of individual proprietorship."

That was radical and startling. It was the first time that the ruler of a great nation had said so much. It attracted favorable attention in Great Britain and in this country. The conditions were more hopeful for an advance than they had been in 1897. The Hague Court had been established, and many arbitrations between Powers, some of great importance, had followed. Once more in December last, and on a more important occasion, the President spoke plainly:

"If now we can negotiate and put thru a a positive agreement with some great nation to abide by the adjudication of an international arbitral court in every issue which cannot be settled by negotiations, no matter what it involves, whether honor, territory or money, we shall have made a long step forward by demonstrating that it is possible for two nations at least to establish as between them the same system of due process of law that exists between individuals under a government."

For such an agreement he believed the United States was now ready. This was a challenge to Great Britain, and Great Britain now accepts the challenge.

Sir Edward Grey is British Foreign Secretary. He speaks for the British Government, and he said in a speech in Parliament last week:

"Such a statement ought not to go without response. We should be delighted to have such a proposal made to us. We should feel that it was something so momentous and so far-reaching in its possible consequences that it would require not only the signature of both Governments, but the deliberate and decided sanction of Parliament. That, I believe, would be given."

His declaration that the British Government would accept such a treaty, which excepted nothing, was received with great applause. Even the Irish members did not object, for

they know that their demands at home are assured. Then followed Mr. Balfour, the head of the Conservative Opposition, and he, too, enthusiastically approved what Sir Edward Grey had offered, and even warmer cheers were sounded from all over the House. Great Britain consents, and she now sends back the challenge and tells us to move forward.

And we do move forward. Secretary Knox and Ambassador Bryce are at work on the formulation of such a treaty, which will except nothing, however "vital," however much a matter of "national honor." It will provide for the easiest and quickest arbitration of all difficulties that may arise; and we believe the Senate will approve it. The new Senate will be quite as favorable as the old. We do not believe that the President expects another rebuff. He has doubtless sounded the leaders of both parties, and he knows that he has the great American people behind him. There is not the Irish opposition here that there was in 1897. We shall in a few weeks, so far as assured and solemn mutual pledges can go, have settled that there shall never be war between the United States and Great Britain. That will be an epoch in human civilization, for these two nations lead the world.

And what is thus done, other nations will be willing to do. We are assured that across the Pacific Japan is ready and anxious to make such a treaty with us. That would end all chance of any great war in which we might be engaged. It would shut the mouths of all but the howling Hobsons, and when their ten prophetic months are past, even they will be as discredited as the Millerite prophets of the end of the world. We shall then need no more navy, except for international police. And meanwhile France will be asking for such a treaty, and Germany will have to follow, and the European nations will be compelled by public opinion, and by the growing burdens of war in times of peace, to accept the example set by us.

And here comes in the most hopeful and the most ominous of all the happy utterances of the past week. Sir Edward Grey warned most solemnly his hearers and all Europe as to the dangers of increased taxation and debts in the cause of war:

> "Unless the incongruity and mischief of all this be brought home not only to the heads of men generally but to their feelings as well, so that they resent the inconsistency and realize the danger of this tremendous expenditure, the rivalry will continue and it must in the long run break down civilization. You are having this great burden piled up in times of peace and if it goes on increasing by leaps and bounds as it has done in the last generation it will become intolerable. There are those who think that it will lead to war precisely because it is already becoming intolerable. I think it much more likely that the burden will be dissipated by an internal revolution, by a revolt of the masses of men against taxation."

That means that at present the nations of Europe are moving toward revolution and the repudiation of their national debts, because the people will be unable to support them. That is ominous enough, but it is true. The enormity of the burden is proof that it must end. Already France and Great Britain have, thru their Parliaments, called for a limitation of armaments, and Germany must follow, or there will be a terrible convulsion. A very few such treaties as that now negotiating will put an end to the danger of any great war, and will allow the reduction of armaments and the reduction of national debts.

May we not now, today, look forward to the time, not so very far distant, when the nations of the world will be freed from the heaviest burden upon them; when their energies shall no longer be wasted on the useless costs of war, but shall be devoted to the arts of peace; when there shall be no more national debts, no burdensome taxation, no international jealousies and fears, but all shall be friends in one great commonwealth of the world? May not the boys of this generation live to see it? What says the great political coronation Psalm attributed to King Solomon:

> "In his days shall the righteous flourish,
> And abundance of peace, till the moon be no more.
> There shall be abundance of grain in the earth upon the top of the mountains,
> The fruit thereof shall shake like Lebanon;
> And they of the city shall flourish like grass of the earth.
> Amen and amen!"

May it not all be in our day?

Abolishing Poverty

It is safe to assume that the newspaper accounts of Mr. Frederick Townsend Martin's visit to the Bowery Mission have not too severely trimmed off those embellishments which are characteristic of up-to-date journalism. Making all proper allowances, however, for reporters' rhetoric and psychology, it appears that Mr. Martin has become distrest, to a degree that is creditable to him, over that destruction of the poor which, as Holy Writ assures us, is neither more nor less than their poverty.

It is always something to be glad of when the favored ones of this world, who confess, as Mr. Martin did, that it has never been their lot "to suffer poverty," make the discovery, which Mr. Martin announced, that there are "thousands of human beings willing and anxious to serve, who somehow or other are deprived of the opportunity of serving or being served"; and when they are so moved by the fact that they resolve, like Mr. Martin, to spend the remainder of their lives in finding out what can be done about it.

The discovery and the resolve are by no means so infrequent as the cynics believe, but it is rare, as our observation goes, that a man who has never known want sees as clearly as Mr. Martin that "charity will never solve the problem of poverty, for this is not an individual but a national, a social problem." In fact, very few, even among professional reformers and philanthropists, have gone to the heart of the matter so directly, and we do not remember ever to have seen the exact truth about it exprest more tersely or more accurately.

Mr. Martin does not say how he expects to go about the task of providing opportunity for everybody and abolishing poverty. He will not attribute our skepticism to any doubt of his sincerity, we hope, if we dissent from his optimistic faith that everybody would rather work, and work hard, than stand in the bread line, if a chance and the wages were offered. We can go with Mr. Martin as far as to believe that if opportunities were more equally and freely provided it would be a far simpler thing than it is now to deal with that marginal part of the outcast population which would rather not work under any circumstances, and with that larger contingent whose work, however willingly rendered, is so inefficient as to be of little value.

We assume that Mr. Martin and others who share his hopes have studied the problem of providing opportunity for all enough to realize that, as a social or national problem, it involves tremendous issues of politics and public policy as well as of ethical motive and personal initiative. There can be no extension of opportunity to all so long as the public tolerates land grabbing, the monopolizing and wanton destruction of natural resources, and the creation of special privileges for the powerful, under the guise of public franchises. The creation of opportunity for all involves a frank recognition of such principles of natural justice as that the bounty of nature belongs of right to all, and should not be given away to the few; that government and law are for the benefit of all and not for the aggrandizing of the clever and powerful. It involves also acceptance of a principle of expediency which has been strenuously opposed in American political history, namely, that the public in its organized capacity as the State, may and should assume the duty of promoting the general welfare, not only by maintaining order, enforcing the civil and the criminal law, and providing educational opportunity, but also by regulating the economic life, insisting on safe and sanitary conditions in industry and in dwelling places, providing systems of insurance against accident, sickness and unemployment, and guaranteeing provision for old age.

Nor will poverty be abolished, even when all these principles have been accepted and applied. It will be necessary then to go yet farther, and see to it that a hopeless lack of initiative, a fatal inefficiency, and a congenital unwillingness to make the most of opportunity when offered, are corrected by effective methods. Some people must be put into their opportunities and held there. There must be such institutions as farm colonies and workshops for the inefficient, to be conducted with no thought that they will "pay" in any other sense than that they will diminish misery and provide discip-

line. But these things can be provided and can be made to succeed when the world arrives at the point of acknowledging that the first condition for the abolition of poverty is the establishment of social justice.

New Land Laws Needed

ONE day before the announcement of Secretary Ballinger's resignation, seven men were indicted by a Federal grand jury at Detroit for conspiring to defraud the Government of coal land in Alaska, valued at more than $50,000,000. Ten days later, at Chicago, nine were indicted for a similar offense, the value of the land involved being $10,000,000. In November last, at Spokane, six men were thus formally accused and held for trial. The Government's estimate of the value of the coal land covered by the claims in this case was $200,000,000. Names are given below:

Spokane, November 3, 1910.—For conspiring to defraud the Government of 20,960 acres of coal land, valued at $200,000,000, in the Kayak district of Alaska, the following six men were indicted: Henry White, ex-Mayor of Seattle; Charles A. Mackenzie, real estate agent, of Seattle; Donald A. Mackenzie, of Seattle; Raymond Brown, of Spokane; William L. Dunn, of Spokane; Charles M. Doughton, of Seattle. There were 131 claims. Among the men to whom claims had been assigned were Governor Gillett, of California; ex-Mayor McGraw, of Washington (no longer living); Congressman McLachlan, of California; and Henry T. Oxnard, President of the American Beet Sugar Company.

Detroit, March 6, 1911.—Wilbur W. McAlpine, McCurdy C. Lebeau, Arthur L. Holmes, Albert H. Roehme, George W. Ross, Frank D. Andrews (all of Detroit), and John M. Bushnell, of Chicago, were indicted for conspiracy to defraud the Government of 48,000 acres of coal land in Alaska, valued at more than $50,000,000. It was alleged that they had induced more than 200 persons to make fraudulent entries in the interest of a corporation, and that with these were others who had been deceived.

Chicago, March 6, 1911.—Nine men, named below, were indicted for conspiracy to defraud the Government of 10,000 acres of coal land in the Matanuska district of Alaska, valued at $10,000,000: A. C. Frost, Chicago, formerly president of the Alaska Northern Railroad Company, and of A. C. Frost & Co.; George M. Seward, receiver for the latter company; Pierre G. Beach, formerly secretary of the Alaska Northern; Frank Watson, of Spokane; George A. Ball, of Muncie, Ind.; Duncan M. Stewart, of Alaska, formerly manager of the Southern Bank, of Toronto, Canada; Harry C. Osborne, Gwyn L. Francis, and Francis H. Stewart, bankers and brokers, of Toronto. It was alleged that many persons, "dummy" claimants and others, had been induced or employed to make fraudulent locations and entries in the interest of the indicted men.

It should be said that the investigation which led to the Detroit indictments was begun about four years ago, by Mr. Ballinger's orders.

These three groups of indictments show how the enormous value of Alaska's coal deposits has tempted men to seek possession of them by violating land laws which are out of date and clearly unsuited to the requirements of present conditions. We are offering no excuse for these men. If they have broken the law, as the indictments say, they deserve to be punished. But the laws should have been amended long ago. Successful violation or evasion of them has usually placed natural resources of great value permanently in the possession of powerful corporations and capitalists, at very small cost. Such would have been the disposition of the Cunningham group of Alaska coal claims (which were regarded with some favor by Mr. Ballinger) if the patenting of them had not been prevented by allegations that their history resembled, in some respects, that of the claims affected by the Spokane, Detroit and Chicago indictments.

The motives of those who criticised and opposed Mr. Ballinger and his administration of the Interior Department, especially with respect to the public lands, were not unlike those of the grand juries in the three criminal cases which we have mentioned. They sought to prevent unlawful and fraudulent acquisition of natural resources in Alaska and elsewhere by great corporations or monopolistic combinations, to conserve these resources for the people, and to procure suitable laws for the development and use of them.

"Of course," said President Taft, in his letter to Mr. Ballinger, "it has been made evident that I was and am the ultimate object of attack." About this the President has been misled. How could it be so, when the land policy of Mr. Pinchot and those who stood with him against Mr. Ballinger was substantially in accord with that of Mr. Taft himself?

And they heartily commend the President's appointment of Secretary Fisher, whose policy and purposes are like the President's and their own.

Mr. Taft, the new Secretary and those who opposed Mr. Ballinger have realized the need of new land laws. The President has repeatedly recommended the adoption of a lease and royalty system for coal and oil lands. As to this, the opponents of Mr. Ballinger stand with him. So do the members of the joint Congressional committee which conducted the Ballinger investigation. There was disagreement in the committee about the Secretary, but all the members, Republicans and Democrats, were for leases. The President's recommendation on this point was before Congress at the beginning of the recent session; the committee's report was submitted only a week or two later. But Congress took no action. "There can be no decent excuse," we remarked on December 15, "for failure to enact the needed laws before the end of the present session." And no such excuse has been offered.

Now there is to be a special session, in which the first duty of Congress will be the passage of the Canadian Reciprocity bill. All but five of the Democrats in the House voted for it when it was passed, a few weeks ago. About two-thirds of the present Senators, it is said, will be counted for it if it can be brought to a vote in the Senate chamber. Mr. Taft's agreement with Canada should be approved without delay. It is now expected that much time will be given to tariff revision projects, originating with the Democratic majority in the House. It may be that none of these will be accepted by the Senate. The President prefers that the revisers shall wait for the reports of the Tariff Board, which will be ready for the regular session in December.

Why should not Congress, following the recommendations of its committee and of the President, take up our antiquated land laws at this special session, and provide reasonable lease and royalty regulations for a just development of the natural wealth in the 90,000,000 acres of coal, oil, phosphate or power site land, in Alaska and elsewhere, that are now withheld from use?

The Mexican Problem

SENATOR BURTON, of Ohio, says that if the Mexican revolutionists capture the city of Chihuahua, our Government will probably intervene. There is no good reason why the fall of Chihuahua should cause intervention. The surrender of that city would not necessarily indicate a great growth of the rebellion, nor would it make any considerable change in the condition of Northern Mexico. There have been all kinds of stories about Chihuahua. Some weeks ago the revolutionists and their friends on this side of the boundary asserted that General Navarro and his troops were surrounded and securely confined there. But when Juarez was menaced by Orozco, Navarro emerged from Chihuahua with his soldiers and deliberately marched to Juarez, without meeting any revolutionists on the way.

While he was in New York, Señor Limantour, the ablest statesman now holding office in the Government of Mexico, published the following remarks about intervention:

"Now as to this matter of intervention, the word has been much used and loosely used, altho I recognize that it has not been employed by your Government. I wonder do the newspapers that print it and the persons who speak it so freely realize what it means? I have said today that I am 'a great believer in the keen sense of justice of the American people.' I wish to reaffirm that most emphatically, and wish most seriously to direct attention to what intervention, so-called, in this case must mean. When an armed force crosses the border of a neighboring Power without either invitation or permission, what does that mean? It means invasion, occupation. And what do invasion and occupation mean but war? I ask the sober sense of the great masses of the American people to dwell on that word. What has Mexico done to deserve a threat of war? None has been made by the American Government, but the inference of such a threat has been drawn by the newspapers. I do not believe it is warranted by the wishes of the American people."

Senator Burton has used the word loosely. We do not think our Government will intervene and invade, even if the town of Chihuahua falls and all the northern States of Mexico come under the control of the revolutionists. If the Mexican Government should fail completely to subdue the rebellion and to preserve order, if there should be riot

and anarchy thruout the country, the expediency of intervention might be considered. Even then the invitation or approval of Mexico's Government should be sought. To cross the border without such invitation or approval would be to do something a warrant for which could be found only in a clearly intolerable situation. And such action, if taken at all, should be taken only to restore order.

Those who long for a peaceful solution of the problem look now to Señor Limantour. No other man connected with Mexico's Government knows so well as he the faults of that Government, the need of reform, and the views of the civilized world as to the condition of his country. His intimate association with the Madero family, and his prominence as a trusted supporter of Diaz, make him an ideal mediator. It is an open secret that when he left New York he bore with him the propositions of the revolutionist leader, together with plans of his own for reform. It is believed that those plans require changes in Cabinet and other offices which would virtually make him President, or at least place him directly in line for succession to the Presidency.

Possibly in response to suggestions by wire from him before his departure from New York, President Diaz recently intimated that he was considering projects for the purchase, by the Government, of great estates, and the sale of the land in small parcels to the people, on easy terms. This would not be enough; fundamental reforms in local government are needed, and political freedom should be granted. But the aged President would postpone even this slight change for the better until after the surrender of the revolutionists or their withdrawal from the field.

This will not do. If he is convinced that justice requires such a distribution of land, he should not wait for the revolutionists to lay down their arms, but should take measures at once to make his proposed reform effective. If justice calls for reform, it demands that there shall be reform at once. It is evident that reform must come, even if it comes with much shedding of blood. Great loss of life and property, serious complications with foreign Powers, and possibly the destruction for a time of all orderly government in Mexico, may be prevented if those who rule will now accept the plans for betterment which, we are led to believe, are recommended by their trusted associate, Señor Limantour.

The Last Chapter

FIVE years ago we published the experiences of a Methodist itinerant under the title of "A Handicapped Life." The author was a man not only of superior intelligence, but of a kindly spirituality, which marked him at once as a scholar in heavenly mindedness. It seems, however, that from his birth he was more than half blind, and this appears to have been the reason why he had served up to that time for twenty-eight years the poorest and hardest circuits in a conference in the Methodist Church, South. Exactly why a defective vision should be given work so hard and so long distanced that it must have required the best eyesight to accomplish it is one of those dispensations which can be easily explained to prelate, but not to God.

And now in this issue we publish the concluding chapter of this itinerant's experiences. And the reader will turn many a page in many a book without finding so brave a story of a man's life.

The simplicity and veracity with which he sets forth his happy lot with a wife and three children in a mountain circuit, where they lived on $400 a year, is an exhibition of heroism so naïvely unconscious that only a child or a saint could achieve it. He waxes a little eloquent and puts in two or three sentences of "fine writing" about the home life upon the hills. He and his family could still enjoy the beauties of Nature, altho they lived on 25 cents a day for each, and this sum included clothes, missionary dues and traveling expenses when they moved to the next appointment. He did not entirely understand his own case, it seems. The reason he could enjoy the sun when it "went to its setting thru a mist of gold" was because he was himself a blind man who enjoyed the much more peculiar privilege of having God to smile in his face.

It is written, "Let him that standeth take heed lest he fall." This is especially applicable to standing in the Methodist itinerancy, from all accounts. By way of being a faithful servant to God, you may build up your work so that a better, stronger man, with good eyes, will ask the presiding elder for it, and get it. A bishop's cabinet is a corporation which may surpass the most remorseless trust in the abuse of power. And from some accounts leaking out in these latter days, it has been known to develop the greed in good men and to tempt others to acts of astonishing tyranny. The blind hero of these pages appears to have been such a victim. Forced to move from a place where he was wanted by the uneven laws of a system which does not allow a preacher to remain longer than four years in any charge, but permits bishops to stay as long as they please anywhere they please, he is given a circuit so difficult as to insure failure. This, of course, was not the purpose of the cabinet. But if a man is old and half blind, and if there are many young and ambitious preachers to be placed, it is the spiritual law of gravitation in such a system that the old one will get what is left after every stronger man has been placed.

But here is where the light shines strongest in the simple narrative. He is shocked when he is informed of his superannuation. He had been taken into the conference almost grudgingly. He remained on sufferance. It was never for him a hope or a question of "rising," but merely of getting work at all. Still, he is heartbroken at the idea of being retired, of being held up from cavorting with the angels and enjoying himself on an "old stump" circuit, with the precarious salary of $400. And this salary is not what he begrudges and finds hard to give up, but it is the Sabbath sermon hour, the "lining" on of old Jerusalem hymns, and the bowed heads at revival time about the altar, drawn there by his words and prayers. He does not understand, nobody understands it, but thirty years on backwoods circuits in the Methodist itinerancy might make a poet of any man. And the old superannuate misses first and keenest the mighty swellings of the spirit when he is retired. There is nothing left in the order of things with which he is accustomed to riming. Another cares for his dear sheep. And he is an old shepherd left out "on the mountains wild and bare," to perish the best and quietest way he can. No bleating for him.

The manner of this perishing, however, is a glory and a transfiguration that the sun never can equal, no matter thru what "golden mists he went to his setting." Beruined, mortified with a grief that sits up with him in his dreams and "lurks" all day on the "outskirts of his thoughts," our superannuate suddenly recalls himself to his part in that great order with which bishops and elders may have so little to do. He remembers that he is a Christian soldier. Therefore he will make a good riding. He "will not be idle." He is about to deliver a lecture —we may safely wager that it is a cane bottom affair composed of old sugar-stick sermons! Also, he has written a book. Saints in heaven! how he looks about among the old hymn leaves of life for something to keep him busy, and what a fuss he makes; anything to distract his mind, to keep from entertaining those thoughts that "lurk in the outskirts." He is "resolved not to become a cynical old man." You observe that God, then, is still smiling in his face, which is a great honor, if you know what it means.

Moreover, he concludes, cheerful that as a superannuate his lines have fallen in pleasant places. This is a fact. Few retired itinerants have a home offered them or half the income this one claims, and that sets even folks of the world to thinking. For example, some years ago Congress voted a large sum in payment for damages done the Southern Methodist Publishing House at Nashville during the war on condition that the interest of this money should be divided each year among the superannuate preachers in that Church. It is alleged, however, that most of this money was used to start another publishing house in Dallas, Tex., and that the superannuates have never received a dollar from this source.

A Church, any Church, is in danger of becoming a queer thing when it is well planted and exceedingly well nourished. A beam gets in the spiritual eye of its leaders, and much of the money raised for salvation is spent spreading just the Church, the bricks and stones of it.

That Vacation Number

SOME weeks ago we told our readers of plans for the 1911 Vacation Number, which will be issued June 1. We want you to tell us in a few words, not over 400 of them, about some particularly amusing, recreative, inexpensive or merely enjoyable vacation, with pictures if you can supply them. As a matter of fact you will probably tell us about only a part of that vacation. We shall award prizes and you need not be a subscriber to win one of these. We also offer prizes for photographs unaccompanied by narratives, and we ask that these photographs represent people or places found in Insular America—the Philippines, Porto Rico, Hawaii, Samoa, etc. —or in Panama. To recapitulate:

The prizes for accounts of vacation experiences are $15 and $10. If you fail to receive a prize, you will receive, if we publish your article, a two years' subscription to THE INDEPENDENT, which we suggest that you share with some friend.

Prizes of the same amount are offered for pictures; and $2 for all the other photographs used.

It is none too soon to send us narratives and photographs. Certainly it is none too soon for you to put your adventures into shape, or to print from your negatives. Anything which we receive after May 1 is likely to be thrown out, simply because we have made an earlier selection. We know from experience that interesting outings have been enjoyed and afterward described as far away as the Himalayas, and almost as near home as next door. As for the photographs, our readers will be interested above all in those which tell a story or are locally characteristic. We don't want a picture of the post office somewhere or other, unless it is a mighty interesting post office, or unless the people in the foreground make it worth while to visit that post office.

Dr. Aked's Disappointment

Far be it from us to judge in the difference between Dr. Aked and the Fifth Avenue Baptist Church, of which he has been pastor for nearly four years. He is disappointed. The society has not built him the large institutional church he understands they promised him, and if they do not come to time in two weeks, as we presume they will not, he will accept the call of the First Congregational Church in San Francisco. The new church would cost perhaps two million dollars, for it must be on Fifth avenue, and must have an auditorium to hold two thousand people, with the institutional belongings. He does not want to be a family pastor to a church of moderate size. That would be a "meager" service compared with what was expected and the kind of work he did in England. We can't blame him; we do not blame them. It may be better for him to do larger service in a less humdrum place. That he should go from a Baptist to a Congregational pulpit is not remarkable; there is no difference between the two denominations worth noting since the Northern Baptists have ceased insisting on close communion. There is nothing left to keep the denominations apart. Neither cares how baptism is administered, any more than God cares; and as to infant baptism, in neither ranks is it held to be a saving ordinance, nor anything more than a form of parental consecration.

Los Angeles

In this and some other States a city does not have real self-government; it cannot make or amend its organic law. The State does not quite trust it, and it imposes its charter. That is not so in some other States, as in California. The city of Los Angeles has by vote of its citizens very materially amended its municipal charter, putting in all the new forms of popular control which we have learned from Oregon. The Legislature has the right of veto, but it never has exercised it. Already Los Angeles had adopted the initiative, referendum and recall, and the control of public utilities. Now it has added the right to acquire, build and run any business for the public service, telephone, telegraph, railroad, steam boats, water, quarries, warehouses elevators, pretty much anything needed for the public, and this ownership may reach beyond the city or State. We be-

lieve Los Angeles is well governed; at any rate the people are not afraid of trusting themselves. The process of election of officers is simplified in a way that will tend to make the people take interest in the nominations. All nominations must be by petition, and without party designations. If at the primary election any candidate receives a majority of votes that election is final; and if no one has a majority only the two highest candidates are voted for at the regular election. So Los Angeles leads the country in trusting the people, as Houston did in trusting a commission elected to rule a city.

Hawaii and the Yellow Peril

We are told that Orientals must not be allowed to be received freely as immigrants because they will not be naturalized and become American citizens. Well, it was once declared that if you put a fish in a dish of water the water will not rise. The question is, Is the assertion true? We know they do not become citizens, for they are not allowed to; but would they if they were allowed to? We have observed the following statements in a reputable journal:

"The Japanese, as shown in Hawaii, have no inclination to become American citizens.

"The Orientals will not make Americans; therefore Oriental immigration should be restricted."

The appeal is to Hawaii, and to Hawaii we will go. Hawaii shows exactly the opposite. There are hundreds, if not thousands, of Japanese in Hawaii who would become naturalized if they could. Of their children born in Hawaii 3,760 are registered American citizens, with 13 registered voters. Only a very few are as yet old enough to vote. There are 3,869 Chinese registered citizens, with 396 registered voters. In a few years the Chinese and Japanese boys will be voters. They are reported to us as making as good citizens as do the European immigrants. Hawaii holds the key to peace, not with fortifications, but by friendship. Asiatics are treated like brothers. The erection of Hawaii into a State of the Union, which is coming one of these days, will do more for the peace of the Pacific than any other one possible procedure.

Politics in a University

We have had occasion now and then to call attention to the meddling of politics with State universities, and in particular the removal of teachers whose advanced political or sociological views gave offense to those in power. A serious case has lately developed in the University of West Virginia, a professor of Greek, Henry S. Green. His son is publisher and editor of a Republican paper in the State, and the father writes editorials for it. That journal has severely criticised the fifteen Republican State Senators who fled the State to break up a quorum, and we presume Professor Green wrote the editorials. So angry were these men that they made it a condition of the annual appropriation for the university that Professor Green be removed, and the regents submitted and dismissed him. For five years he had been doing this editorial work, but no fault was found until these Senators were criticised, when they struck back. It was not their business to judge whether a professor was competent, but of the regents; so they held up the regents in this cowardly way.

Adjutant General Verbeck, of Albany, says that the military spirit in America is at a low ebb. It is true, and not a matter for regret. Every old man can remember when every town had its annual "training" on the village green; our boys never have seen one. He says it is difficult to get recruits for the National Guard. True, for the reason that it is not easy to show that the National Guard any longer is needed. He specifies the reasons for this neglect of the National Guard, Andrew Carnegie's peace fund, Lake Mohonk's conferences, the opposition of women teachers in the public schools to military drill, the objection of wives to their husbands giving time to military interests, commercialism, social obligations, and the ridicule to which military officers are subjected. But why the ridicule, why the decay of the military spirit? Because it is seen that war is no way to settle difficulties, and belongs to a vanishing age. Let the military spirit go and thank God.

The lady adviser for the girls at Cornell University indignantly denies that any ban is put on colored girls at Sage College, the girls' dormitory. She says that when two colored girls came to her to apply for rooms she simply advised them for their own comfort to go elsewhere, as it would be made unpleasant for them. That substantially supports the charge. Those girls could take the advice only as a refusal. The lady adviser ought to have talked to those who were likely to make trouble. Several years ago there were two colored girls in college who were popular enough and were chosen members of the girls' societies.

When the Sunday school lesson comes across the story of Elijah slaying the 450 prophets of Baal we do not like to see the expositors in the Sunday school journals defend it by telling us how in the course of nature God destroys people by the hundred or thousand by volcanoes, earthquakes, hurricanes and floods. There is a difference. Nor do we like to see the attempt to prove the miracle reasonable which tells us that Elijah was carried to heaven in a chariot of fire, by showing how miraculous it would have once seemed to see an airman flying in the sky. Neither helps faith.

We wonder if all the Catholic priests like the new order requiring them to take oath that they abjure all the errors of Modernism. Some of them must retch at it, while some will joke at it, as does the editor of *The Western Watchman,* of St. Louis:

"The Archbishop has sent out a copy of the new oath against Modernism which must be taken by all priests in charge of souls before the New Year. It is as long as the one taken by bishops at their consecration, and vastly more intricate. Many priests will see for the first time an explicit statement of the errors they forswear. Modernism must be a sly old fox if it takes all that paper to smoke it out."

What the journals generally published as a fact, that a cloistered nun had died in this city lately who had been under a vow never to see a man, and had only spoken to her father thru a thick curtain, we accepted as true and so published it. *America* tells us it is absolutely false. The woman had seen and talked with her father every fortnight for twenty-five years. We are glad we were mistaken, sorry we made the mistake, and we thank our courteous neighbor for correcting us.

The Roosevelt Professor publicly airs his grievances against the Harvard Exchange Professor, and the country laughs. It has no admiration for a scholar who spoils another scholar's social ambitions; nor has it any sympathy for another scholar who sheds angry tears in public because he was not invited to a ball. Ambassador Hill gave him good advice to keep quiet, but he was boiling over and couldn't. Now let the curtain fall on the farce.

The London *Times* is wrong in attaching so much importance to the letter it publishes signed "An American Exile," which asserts that an arbitration treaty such as President Taft advocates would be rejected by the Senate because of "Jefferson's" warning against "entangling alliances." The opinion of an American who has been exiled so long that he has forgotten Washington's Farewell Address is not worth much.

One would imagine that the laws of Nevada were lax enough, but both houses of the legislature have passed a bill making divorce easier. Residence before divorce is reduced to six months, with the privilege of leaving the State "when necessary" while establishing a residence. We give free to all applicants this advertisement, which comes from the Botany Bay State which pulled off the big prize fight.

It is pleasant to read in the Houston (Tex.) *Post* a strong appeal for the liberal support by individuals and the State of institutions for the higher education of negroes. The duty is thus well put:

"We have in Texas nearly 1,000,000 negro citizens, and their part in the future development of the State and its resources will be measured largely by the opportunities their children have to equip themselves for the duties of life."

INSURANCE

Report on Metropolitan Life

THE report of Superintendent Hotchkiss on the examination of the Metropolitan Life Insurance Company is full of interest. He believes that the interests of government require the industrial masses to have insurance, paid for weekly to collectors who go from door to door. It must be given them either by private corporations or by the State. The State must, therefore, permit corporations to write industrial insurance practically as it is now written, or else the State must prohibit the writing of such insurance by private corporations and write it itself. The State, in the judgment of Superintendent Hotchkiss, is not yet ready to assume such a burden.

The examination indicates that the company has progressed in many ways since the investigation of the Armstrong Committee five years ago. Certain criticisms then advanced still persist, tho in a lesser degree. Industrial insurance costs the insured more than ordinary insurance and the lapse ratio is very high. These elements are, however, inherent in industrial insurance, and all that can be expected of a company writing it is that it use every effort to lower these ratios. The campaign of the company against tuberculosis is spoken of with approval, altho the praise should have been still more emphatic. For a time the company was prevented from erecting a sanitarium under the State laws, but permission has recently been given to acquire land in Saratoga County for this purpose. The company states its intention of ultimately extending this hospital service to its policyholders, but at the outset it can be used only for employees. In a worthy enterprise of this character, every assistance should be rendered by the State authorities.

In concluding, Superintendent Hotchkiss states that the present need is not so much new laws on this subject, as the thoro supervision and frequent examination of companies of this class, coupled with the searching publicity of men and methods now rightly demanded of all corporate enterprises in the insurance field.

MR. L. G. FOUSE, president of the Fidelity Mutual Life Insurance Company, in his annual report makes the following comment on aviation mortality:

"The record of the past year, thirty-two lives having been lost as against five the previous year, is something appalling considering the small number exposed. Because of the progress made, the hight and speed attained, and the exhilarating effect of the sport, it is almost certain that the number of participants will greatly increase, and it becomes the part of wisdom for the life insurance interests to note the new peril and be prepared for it. While fredom from all manner of restrictions seems to be the order of the day, it is utterly inconsistent with the function of life insurance to disregard all measures of safety and transfer the cost of these hazardous ventures to innocent people who do not indulge in them. Public sentiment in this matter of aviation mortality should be aroused and the laws so modified that the interests of the people generally may be safeguarded. The idea that if a man take out an insurance policy all hazards should be assumed by the insurance company, no matter what the insured may do, is not just. The quicker legislators realize this, the better it will be for the interests of honest insurers."

THE city of Springfield, Mass, proposes to equip all its fire engines with motor power. It has been found that the motor costs less and gives more satisfying service than the horse. The Mayor of Birmingham, Ala., has recommended the purchase of motor engines.

THE Travelers' Insurance Company has prepared a table showing the cost of insurance in cents per day. The cost of the three principal forms of life insurance policies for $1,000, at the different ages, is given as follows:

Age	20	25	30	35	40	45	50	55
Ord. Life	.04	.05	.05	.06	.07	.09	.11	.14
20-pay. Life	.06	.07	.07	.08	.09	.10	.12	.15
20-yr. End.	.11	.12	.12	.12	.12	.13	.14	.16

WHILE boiler explosions are not a menace to most of us, their frequency is attested to by the report of the Fidelity and Casualty Company, listing 56 boiler explosions for the month ending January 24, 1911. During the same period there were 82 accidents recorded in elevators and 11 fly wheels burst. In one boiler explosion 17 men were killed, and a bursting fly wheel did $20,000 worth of property damage.

FINANCIAL

The Net Earnings Tax

THE tax on net earnings of corporations was proposed while the Payne-Aldrich tariff bill was pending in the Senate, and at a time when a movement for the imposition of an income tax had so much support that those who opposed it feared it would be successful. Pressure for an income tax was at once reduced. While the project was brought forward under such conditions, it is well known that it was earnestly promoted by the President because he desired that the power of the Government to inquire as to the financial affairs of corporations should be established and exercised. Revenue amounting to $27,000,000 a year is not to be overlooked, of course, but in the minds of those who proposed this legislation, the collection of revenue was not the chief object of it. The power has now been established, by the unanimous vote of the court of last resort. Thus far not much of it has been used. A much more extensive use of it may be seen hereafter. It is a power that permits Federal regulation of much that pertains to the conduct of a corporation, including accounts, capitalization, the issue of bonds, and the ways in which liabilities are incurred. So far as certain great corporations or combinations are concerned, the Government should have this power; so far as a large majority of the small corporations are concerned, it is not needed.

While the revenue provisions of the law are not yet especially prominent, they can be made so at any time by Congress. For example, if the rate of taxation should be increased from 1 per cent. to 5 per cent., the annual receipts would automatically rise from $27,000,000 to $135,000,000. We have not thought that the law was entirely equitable, because small corporations must pay a tax which is not exacted from partnerships or individuals engaged in the same business and competing with them near at hand. Moreover, it exposes to these untaxed competitors certain financial conditions as to which the corporations might reasonably prefer to avoid publicity. The court points, however, to several advantages due to the corporate form which deserve to be considered: the continuity of business, without interruption by death; the easy transfer of property interest by the disposition of shares, and the general absence of individual liability. But it is these advantages that are taxed.

*

....As the result of borings in the Talcahuana district of Chile, coal beds have been discovered that will yield 150,000,000 tons.

....The gold output of the Transvaal for the last five years has been as follows: 1906, £24,579,997; 1907, £27,403,738; 1908, £29,957,610; 1909, £30,925,788; 1910, £32,002,912.

....The Jefferson Bank has moved from Canal and Forsyth streets to the building on the Bowery and Grand street, and has also taken over the branch office of the Madison Trust Company, which was formerly at the corner of Bowery and Grand street. This arrangement has the approval of both the State Banking Department and the Equitable Trust Company.

....Edward T. Perine, the new vice-president of the Windsor Trust Company, was formerly an officer of the Third National Bank of Jersey City, and in 1893 became secretary of the United States Mortgage and Trust Company, and the following year its treasurer. Mr. Perine later became managing officer of the Audit Company of New York, and has recently been the Deputy Comptroller of the State of New York.

....President William N. Wood, of the American Woolen Company, in his annual report explains that the reduction of the company's net profits from $5,798,000 in 1909 to $3,995,000 in 1910 was due to the menace of tariff reduction. But he reports a gratifying improvement in the first months of 1911, "the orders now in hand being sufficient to guarantee work for all the carded woolen and all the worsted mills of the company for several months to come."

VOL. LXX NEW YORK, THURSDAY, MARCH 30, 1911 No. 3252

Survey of the World

Mexico's Cabinet Ministers Resign

All the members of the Mexican Cabinet resigned on the 24th, and it was predicted that only one of them, Señor Limantour, would be reappointed. Señor Corral, Minister of the Interior, retained the office of Vice-President, but it is said that he will soon withdraw from it and go to Europe. In an official statement it was explained that the reason for the Cabinet's action was a belief that it would "contribute to a restoration of peace and facilitate the reforms" which were "in contemplation." None of the Ministers was less than sixty-five years old; several were far advanced in years and partly disabled. All but one had been in the Cabinet a long time. This one, Señor Creel, Minister of Foreign Affairs, a man of great wealth, had become very unpopular, especially in his own State of Chihuahua, now the center of revolution. Immediately after Minister Limantour's departure from New York, it was predicted that his arrival at the Mexican capital would be followed by a reorganization of the Cabinet. The resignations showed that his counsel had prevailed. On the 25th it became known that Señor de la Barra, Ambassador at Washington, had been recalled and appointed Minister of Foreign Affairs, Señor Limantour preferring to retain his old place, and that the new Cabinet, soon to be completed, would press reforms relating to elections, the government of States and cities, and the distribution of land. It was said that General Bernardo Reyes would be recalled from Europe to serve in the Cabinet or with the army in the field.—— Señor Limantour arrived safely at the capital on the 20th, and had an enthusiastic reception. At once he began a series of conferences with President Diaz. To the press he denied that he was the bearer of proposals for peace. The revolutionists must lay down their arms. Every day the danger of international complications was increasing. Public opinion had placed a heavy burden on his shoulders, but he insisted upon pointing to President Diaz, "the illustrious statesman who had formed and developed the nation." All confidence should be placed in this "expert helmsman," whom all should aid in averting danger from without and in providing "the reforms, more or less urgent, required by the present political situation." It was absurd, he added, for Gustave Madero to say that he had returned to take the Presidency. It had always been his firm determination not to accept any position "in the militant politics" of his country. His remarks were disappointing to the rebel leaders, but one of them said the expression of such opinions might be required for the accomplishment of his purpose. In another statement, on the 22d, Señor Limantour said Mexico was facing a crisis greater than he had thought it could be, and that the Administration had no definite plans for solving the problems presented, altho it was considering reforms. Since his departure for Europe there had been a great change in the attitude of the people toward the Administration. There were two classes of the dissatisfied: one composed of intelligent non-combatants, and the other including Madero's followers. For the latter the Administration had no terms except those of the War Department. He was trying to find the cause of the feeling of opposition. There was a demand for a revision of the electoral laws, and revision must be made. But the Government could not yield to armed

forces.——After the resignation of the Cabinet he said he hoped for a solution of the problem in the near future. The President was prepared to propose reforms and to satisfy all legitimate demands.

Purpose of Our Government Explained

At the beginning of the week there were newspaper reports that the United States troops were soon to move to the border. Mr. Taft assured the Mexican Ambassador that there was no cause for alarm or irritation on the part of Mexico. The reports were denied, and orders were given that movements of the troops should be announced first at Washington. On the 21st there was published a semi-official statement as to the attitude and purpose of our Government. The troops were sent to Texas, prepared for any emergency, it was said, because of reports indicating that conditions in Mexico were approaching such chaos as at any time might threaten American lives and property in that country. Mr. Taft acted quickly, hoping thus to stay the threat of danger. He thinks he has been successful, that the presence of the army has had a sobering influence, and that Americans and their property will be respected. There will be no move toward the border "unless outrages so flagrant as to call for a protecting force occur," and even then the President "would not think of acting without the consent of Congress." But he felt that it was his duty to prepare for an emergency, so that, if Congress should be called upon to act, its orders could be carried out with the greatest possible speed. Any rupture of friendly relations with Mexico must come as the result of some overt act on Mexican soil. The United States has no desire to interfere in Mexico's internal affairs, and the President will not recommend interference to Congress "unless the circumstances become such as to permit no other possible course." Every possible chance to restore order will be given to President Diaz. The troops may remain in Texas "for at least four months." Mexico has made no protest against their presence there. Mr. Taft says he ought to be the last person in the world to be suspected of jingoism. He is prepared to defend his course in answer to attacks which are to be made in Congress.——Owing to sensational reports alleging that Japan was directly interested in the Mexican disturbance, Mr. Taft sent for Japan's ambassador, told him he knew the reports were false, and asked him to repeat his remarks to the Emperor, assuring him of our continued confidence and friendship The Emperor promptly replied in a personal message, saying that, while he knew the President had given no weight to the "false and wicked reports," he was glad to receive assurance that our relations with Japan had never been more cordial.——The War Department has called for 6,000 or 7,000 recruits, to fill vacancies in the regiments which were mobilized.

Course of the Insurrection

Madero has issued a decree, ordering that all persons who promulgated or who may enforce the Government's suspension of constitutional guarantees shall be regarded as guilty of homicide. ——Owing to lack of food on the Mexican border, insurrectionists have been raiding ranches and mining camps in Texas. Troops were sent to the relief of the people of Chisos, but the raiders were driven away before they arrived. Cavalry were also sent last week to protect the quicksilver mines at Terlingua, where the supplies were in danger. A guard was placed at the Southern Pacific's bridge over the Pecos River, five miles this side of the boundary.—— Hermosillo, the capital of Sonora, was menaced for a time, last week, but in an engagement the rebels were routed, with a loss of 36 men. It was said that Rabago, with 600 Government soldiers, had been trapped near Chihuahua, between two wings of Madero's army, but his defeat was not reported. An uprising at Morales attracted attention to the rich State of Nuevo Leon. Revolutionist leaders asserted that the insurrection was about to spread thru all the border States east of Chihuahua.——Among those killed in the Government's forces have been six students, of prominent families, from the national Military Academy. ——A report that four Americans had been executed by the Govern-

ment after a drumhead court-martial, proved to be false; also another that the Government troops at Ojinaga had intentionally fired upon American troops on the other side of the river.

From Washington

We comment editorially on tariff prospects and there is very little else discussed at Washington, except the organization of the new Congress, the distribution of committee memberships, etc., and the Mexican situation. The success of the postal savings bank experiment is, however, distinctly noteworthy. From January 3 to February 28 almost 4,000 accounts were opened in the forty-eight second-class post offices where postal banks were established on the earlier of these dates. The number of separate deposits is 6,861, and the average amount of deposits $21.50. The Postmaster-General is preparing to establish 250 additional savings banks, an appropriation of $500,000 by the recent Congress having made this extension possible.——Nine more States must ratify the proposed Federal income tax amendment before it can become a part of the Constitution, the amendment having received favorable action in the joint legislatures of twenty-six States, and the Constitution providing that proposed amendments, to become valid, must be ratified by three-fourths of the States. Three States—Vermont, Rhode Island and Utah—have refused to ratify the amendment at this year's legislature sessions, while New Hampshire has taken favorable action in one branch of the legislature only. The question is now pending in the legislatures of Connecticut, Louisiana, Maine, New Jersey, New York and Pennsylvania. It is scheduled to come before the Legislature of Florida next month. Arkansas, Delaware, Minnesota, Tennessee and Wyoming have postponed action or failed to consider it.

Workmen's Accidents and Their Compensation

The compulsory compensation law, passed by the New York Legislature last year, and providing compensation to workmen injured in certain specified dangerous employments, altho such injury occurred thru no fault of the employer and solely thru the negligence of the workman, has been declared unconstitutional by the Court of Appeals, on the ground that it deprives the employer of his property without due process of law, in violation of the Constitution. The law was modeled on the English workmen's compensation act of 1897, which has since been extended to cover every kind of occupational injury. It required employers of labor in such occupations as bridge building, operation of elevators, work on scaffolds, work on electric wires, work with explosives, on railroads, tunnels, or carried on under compressed air, to compensate their employees for any injury occurring in the course of the work. Admitting the force of the arguments adduced in support of the statute, the court points out that under our form of government all economic, moral and sociological theories must be subordinate in legislation to the Constitution. Here we are unlike England, where no written constitution bars the way to desirable reforms. The Wainwright Commission, authors of the act declared unconstitutional, are likely to "try it again," according to one of their members, John Mitchell. In expressing his disappointment he said:

"We aimed at an equitable measure by which workmen who were injured in the trades specified would receive compensation thru the automatic operation of the act instead of the tedious and uncertain alternative of a lawsuit."

One result of the decision of the Court of Appeals is to knock out a bill prepared some time ago by the National Civic Federation—a bill going further than the invalidated legislation, on which, however, it was based. This bill was to have been introduced at this session of the New York Legislature.——John Mitchell read a paper at the Berkeley Lyceum in New York March 21. His subject was "Industrial Accidents and Compensation." He cited statistics of the American Institute of Social Service showing that 536,165 workmen are annually killed or maimed in American industry, while the statistician of the Prudential Insurance Company has estimated the number of industrial accidents at about 2,000,000 yearly.

"It is a strange commentary upon our boast-

ed American civilization that in the United States nearly three times as many persons, in proportion to the number employed, are killed or injured in the course of their employment as in any other country of the world."

Fires produce a very great part of the loss of life in American industry, and last Saturday was marked by an appalling factory fire in New York City, commented upon elsewhere. The building had been recently inspected, and it was relatively fireproof, unless considered from the standpoint of human life rather than from that of property. Earlier on the same day another New York factory fire proved fatal to at least one workman. Six firemen lost their lives in a factory fire in Milwaukee, March 24.

The Railroads

The Interstate Commerce Commission holds that rates not open to all shippers alike are unlawful. The parties to the proceedings include practically all the Eastern coal producing carriers. These are ordered by the Commission to desist for two years from May 15 from their maintenance of tariffs on coal, the rates in which are restricted to shipments of or for certain consignors or consignees. "There are few commodities not purchased and used directly or indirectly by railroads," says the Commission, considering the question whether a railroad might legally grant special rates applicable to the transportation of property consigned for railroad use; "and if a railroad were accorded . . . favored rates . . . discriminations . . . would be injected into almost every field of commerce."——In accordance with its plan of retrenchment, the Pennsylvania Railroad has reduced the working time of its shop employees from 55 hours a week to 45 hours. About 1,200 men are affected.——Railroads centering in Chicago have a surplus of rolling stock. It is reported that there are twice as many cars idle as there were a year ago. According to the report of the American Railway Association, which brings its data up to March 15 of this year, there is a surplus at present of 208,527 cars, an increase over the last bulletin of 15,854 cars. This increase of surplus cars is principally in the East and South.——At least ten persons were killed and twice as many injured, March 25, when the southbound "Dixie Flyer" of the Atlantic Coast Line was wrecked at Alapaha, Ga.——The express strike in the New York metropolitan district has failed, and the strikers have begged for reinstatement, as individuals. Men with good records, unless prominent as leaders of the strike, are being re-employed.

New York: City and State

Fifty-eight ballots had been taken for a United States Senator to succeed Mr. Depew by the end of last week, and the end is not yet. Caucuses of both parties were, however, looked for on Monday night. At the Democratic caucus there was question of the withdrawal of Mr. Sheehan as a candidate. Mr Murphy, of Tammany Hall, promised an unbossed caucus, but his control of the situation is none the less apparent. Governor Dix has expected that only about six names would go before the caucus. It was not expected, on Monday morning, that Senator Franklin D. Roosevelt and his twenty followers who bolted the joint caucus for the nomination of a United States Senator on January 16, would enter the new caucus that night, altho they participated in the conference of the Democratic legislators which adopted the resolution by which the Senatorship caucus has been reconvened. As for Mr. Sheehan, he first refused to withdraw, altho it is understood that the Tammany boss told him that he had no chances of election; then issued a somewhat muddy letter "releasing" his supporters from their caucus obligation, in case the new caucus fixt on a different candidate.——Magistrate Joseph E. Corrigan, of New York City, has declared that crime is rampant in the metropolis, and he blames the demoralization of the police force upon the Mayor. Mayor Gaynor calls this statement "seditious," and threatens to bring about his removal. The New York press with practical unanimity supports the Magistrate's statement in so far as it reveals the facts that there is an unusual prevalence of highway robbery and various kinds of thievery, and that the excise laws are laxly enforced. The police hesitate to

THE TRIAL OF THE CAMORRISTS AT VITERBO.
The prisoners are confined in the large cage, with the exception of the priest and the woman, who sit in the foreground. The informer, Abbatemaggio, has a cage to himself.

make arrests except when they are positive of their ability to prove their case, and this is said to be the consequence of the Mayor's agitation against "unnecessary" arrests, and the alleged policy of the police department to "break" policemen who are responsible for making arrests in cases where guilt is not legally proven. It is charged, also, that "protection" is once more paid for, both by saloon keepers who "keep open" illegally, and by prostitutes. Magistrate Butts has exprest himself somewhat cautiously as in sympathy with the Corrigan statement, but thirteen of the seventeen city Magistrates have signed a document rebuking their associate, altho they do not deny his allegations. The possibility of a Grand Jury investigation is discust.

The Trial of the Camorrists

All parties concerned in the struggle between the Italian Government and organized criminality appreciate the dramatic value of their position, and the monastery church at Viterbo last week presented scenes quite out of character with American ideals of court procedure. The thirty-six prisoners in the big cage simultaneously burst into tears, or shout their innocence, or hurl defiance and threats at the court officials and the carbineers, while their sympathizers in the audience join them in lamentations and protestations. When the indictment was read several women fainted and one went into convulsions. Twice in the same day the judge was obliged to suspend the session because of the impossibility of obtaining order. The jury, procured with great difficulty and by threat of heavy fines for evading duty, is obviously nervous and fearful of the vengeance of the Camorra. A woman clairvoyant prophesied that a bearded juryman would die during the trial and one of the six coming under this designation was taken ill on learning of it, and the trial had to be postponed for the day. The gold ring marked "G. C." which was found in the mattress of

Salvi's mistress and was, according to the prosecution, intended to be sent to Arena as proof that the Camorra had complied with his request and murdered Gennaro Cuoccolo, aroused a great uproar when it was produced in court and held up by the judge with the declaration that it was Cuoccolo's ring. The prisoners shouted in chorus, "No! No! It is not Cuoccolo's ring!" The counsel for the prosecution advanced to the front of the cage and shouted back that it was his ring. The lawyers defending the prisoners joined in the war of words and denounced the opposing attorneys as bribers and hired assassins. Salvi accused the carbineers of hiding the ring in the bed for the purpose of manufacturing evidence and declared that it was absurd to think that the strong and dreaded Camorra would employ so small a man as he to murder an able-bodied woman like Cuoccolo's wife. The priest of the Camorra, Ciro Vitozzi, during the indictment, raised his eyes heavenward and murmured, "I offer my sufferings to relieve souls in purgatory." When he rose to protest his innocence he fell in a faint and the court adjourned again. He has written his memoirs and prison experiences, which he calls "the cry of a martyr whose spotless conscience must appeal to justice." The priest, when asked to explain how he came to have obscene photographs among his papers, said he did not know, but when his lawyer suggested that they might have been left by some penitent he agreed, and added to the lawyer, "God enlightens you." The chief evidence produced so far is the testimony of the informer, Gennaro Abbatemaggio, who came out of his private cage and told his story with a loud voice and dramatic gestures. He declared that he had gained membership in the Camorra at the early age of nineteen, only a year after he had begun his criminal career, and that he was as proud of it then as he was now ashamed of it. He testified that the Camorra not only planned and executed robberies and murders, but ran gambling houses, engaged in the white slave traffic, controlled the police and local government of Naples, and carried parliamentary elections. The defense will endeavor to prove that Abbatemaggio is insane, and Professor Ottolenghi, from the University of Rome, has been subpenaed for that purpose.

A New Italian Cabinet

The fall of the Luzzatti Ministry occurred at an unfortunate time because it leaves the Government without an executive head just when the fêtes of the jubilee of Italian independence are beginning. Premier Luzzatti has been in power only a year, tho that is longer than the term of his predecessor, Baron Sonnino, who held office only three months. The office is now offered to Signor Giolitti, who resigned it in December, 1909. Signor Luzzatti was not formally voted out in Parliament, but resigned because of the increasing dissatisfaction of the radical wing of his supporters. They demanded universal suffrage and this the Government was willing to concede, provided voting was made compulsory under heavy penalties. The object of this was to compel the Catholics to vote. The Pope has opposed the participation of Catholics in the elections of the kingdom, and conservative Catholics have generally complied with his request. By universal suffrage, made compulsory, therefore, the radicals would be likely to lose rather than gain. Two radical members of the Luzzatti Cabinet—Credaro, Minister of Public Instruction, and Sacchi, Minister of Public Works—insisted on resigning, and this brought about the dissolution of the Government. They will probably be retained in the new Cabinet. The King caused great surprise by calling to the palace for consultation Deputy Bissolatti, leader of the Socialists in Parliament. Bissolatti is an anti-monarchist, and during the disturbances of the Chamber of Deputies in 1900 he shouted three times, "Death to the King!" King Humbert was not long after assassinated by an anarchist. Bissolatti and perhaps other Socialists will go into the Giolitti Cabinet.

Russian Affairs

It was announced on Monday of last week that Premier Stolypin had resigned and that a new Cabinet was to be formed under the leadership of V. N. Kokovsov, Minister of Finance. Be-

fore the end of the week, however, the Czar had determined to give Stolypin his own way and to remain in office. Trepov and Burnovo, the reactionary members of the Council of the Empire, who had blocked Stolypin's plans, are suspended by Imperial decree from all sittings until next January. Another ukase decreed the enactment of the law establishing zemstvos or local legislatures in the Western provinces. It was this bill which Stolypin had insisted upon carrying thru in spite of the opposition of the Council of the Empire. The establishment of the zemstvos is believed to be one step in the development of the plan for an efficient system of administration which Premier Stolypin has made the object of his policy. Stolypin's triumph and high-handed action has aroused great opposition to him, both in the Court circle and in the Duma.——The Chinese Government was notified on March 25 that the concessions offered by China were unsatisfactory to Russia. The Chinese reply was accused of being vague and evasive, and the Russian Minister at Peking delivered an ultimatum declaring that unless China formally accepted all of the points in the Russian note of February 16, within three days, the Russian Government would "reserve to itself freedom of action and make the Chinese Government responsible for the obstinacy displayed by it." Within two days after the receipt of this, the Chinese Government made an unconditional surrender of all points at issue and exprest a willingness to conform to the requirements of Russia. This gives Russia free and equal trade rights in Mongolia, extra-territorial privileges for Russians residing in China, the opening of Russian Consulates at important points, and the right to acquire real estate and erect buildings in Mongolia. ——The more oppressive restrictions and severe enforcement of the laws on the Jews in Russia have resulted in an increased emigration. According to the report of the Central German Jewish Relief Association 120,000 Jews were driven out from Russia during the year 1910. Of these 93,107 emigrated to the United States, or 25 per cent. more than in 1909.

Morocco The new French Minister of Foreign Affairs, M. Cruppi, in his first speech before the Chamber of the Deputies, March 24, announced that he would carry out the policy of his predecessor, M. Pichon, in regard to Morocco. The army under General Moinier, at Casablanca, will receive sufficient reinforcement to make an impression upon the insurgent tribes and the French Cabinet will grant equal trade facilities to all nations in the Shawia region and other parts of Morocco within the French sphere of influence. The Minister did not state what action would be taken by the French troops to avenge the murder of Lieutenant Marchand and his four companions by the Zaer tribesmen. It was reported that the Briand Ministry had refused to approve of General Moinier's plan for a raid into the interior in pursuit of the Zaers. There are numerous disturbances in various parts of Morocco and reports of a formidable rebellion against the authority of Sultan Mulai Hafid. The tribes about Fez are reported to be in revolt. The disorders in the neighborhood of the Spanish post of Melilla are renewed and an army train escorted by troops was attacked by natives on March 22. There is great jealousy between the French and Spanish in Morocco. The French accuse the Spaniards of monopolizing the Riff district and of refusing to permit the representatives of French mining companies to explore the country. On the other hand, the Spaniards are much worried over the commercial invasion of Morocco by the French, particularly over the proposal to construct a railroad from Tangier to Alcazar Kebir. The State Bank of Paris has advanced to the Sultan $1,000,000 a year for three years for the purpose of strengthening his military forces, and will make a loan of $8,600,000 to Morocco for public works, particularly the improvement of the harbor facilities at Tangier and Casablanca and the construction of the railroad mentioned above. The reorganization of the army and the construction of public works will, of course, be carried out by French officers and engineers.

Durham, North Carolina, a City of Negro Enterprises

BY BOOKER T. WASHINGTON, LL.D.

PRINCIPAL OF TUSKEGEE INSTITUTE.

FOR a number of years I have made what I have called "Educational Pilgrimages" thru various Southern States, including Arkansas, Oklahoma, Mississippi, South Carolina, Tennessee, Virginia, Delaware and North Carolina. These tours have been undertaken for the purpose of seeing for myself something of the progress being made by the Negro people of these various States, the actual relations existing between the races, and also for the purpose of saying whatever I can to help cement friendly relations between the races. Both races in the South suffer at the hands of public opinion, because the outside world hears of its disgrace, its crimes, its mobs and lynchings. But it does not hear very much about the many evidences of racial friendship and good will which exist in the majority of the communities of the South. I do not believe that one can find another section of the globe where two races which are dissimilar in many respects dwell in so large numbers where they get on better in all the affairs of life than they do in our Southern States.

The last of these trips was made thru the State of North Carolina during the fall of 1910. I was unusually impressed with the general prosperity of the colored people in the rural villages and smaller towns. Farms, truck farms, well-kept grocery stores, thriving drug stores, insurance houses, and beautiful tho modest homes greeted me continually. Again and again I exprest to the Negro business men in charge of my trip that here were in many ways the most encouraging signs of Negro development that I had seen. But again and again, as often as I said this there would come back from several members of the party the answer, "Wait till you get to Durham."

Now, Durham is one of the large cities of North Carolina, and knowing from my early experiences something of the superficial and hand-to-mouth living of the average city Negro, I became more and more curious to see what Durham had in store for me.

Arriving there about four o'clock on a bright afternoon in October, I found every preparation that was necessary to sweep me from my feet with the conviction that sure enough this was the city of cities to look for prosperity of the Negroes and the greatest amount of friendly feeling between the two races of the South. In one town on my way I had actual roses strewn in my path, but here, if all I saw and heard was genuine, were the real roses that I had been seeking now for more than thirty years. Well, and not foolishly, dressed colored people, colored people representing all manner of business, from the small store to the thriving, thorogoing business enterprise, colored people seated in one and two horse carriages with rubber tires, stood eager to welcome me. Still I was not convinced. I had more than once seen members of my race who paid their last dollar for display, not having enough left to purchase a good meal or even to buy fuel to cook with. But I was assured that these people owned all they claimed to own and that I would be shorn of all my doubt before many hours had passed, and I confess that two hours of driving and visiting more than robbed me of all my skepticism.

In addition to many prosperous doctors, lawyers, preachers and men of other professions, I found some of the most flourishing drug stores, grocery and dry goods stores I had ever seen anywhere among Negroes. I found here the largest Negro insurance company in the world, with assets amounting to $100,000, owning its building, a large three-story structure, and being operated with nothing but Negro clerks and agents. Here is located the Durham Textile and the Whitted Wood Working Company,

manufacturers of doors, window frames, mantels and all kinds of building materials. Here, too, is the Union Iron Works Company, a Negro company which manufactures general foundry products, turning out plows, plow castings, laundry heaters, grates and castings for domestic purposes, and it was refreshing to learn that in this enterprise as in others that I shall mention there was no evidence of the color line drawn on the part of the purchaser. Each groceryman, each textile manufacturer, each tailor, in fact, all the Negro tradesmen and business men numbered many white customers among their most substantial purchasers.

I began by this time to believe that Durham was a city of Negro enterprises, and, quite convinced now, I was ready to go home, but they wanted to show me one more successful Negro plant. This was the plant known as the Durham Textile Mill, the only hosiery mill in the world entirely owned and operated by Negroes. Regularly incorporated, they operate eighteen knitting machines of the latest pattern, working regularly twelve women and two men and turning out seventy-five dozen pairs of hose each day. The goods so far are standing the test in the market, being equal in every way to other hose of the same price. They are sold mainly by white salesmen, who travel mostly in North Carolina, New York, Indiana, Georgia, South Carolina and Alabama, and again, so far as I have heard, there has been no man to raise the color question when he put on a pair of these hose made by Negroes.

Aside from these flourishing enterprises Durham had many individuals, such as tradesmen and contractors, who were shining examples of what a colored man may become when he is proficient and industrious. I found that Payton A. Smith, a general contractor, had put up some of the largest buildings in the city, that P. W. Dawkins, Jr., who had learned the carpenter's trade at Hampton, and Norman C. Dadd were not only never out of work, but kept jobs always waiting for them.

It was exceedingly interesting, too, to

BUSINESS BLOCK OF THE NORTH CAROLINA MUTUAL AND PROVIDENT ASSOCIATION, AT DURHAM, N. C.

THE DURHAM HOSIERY MILL: OPERATED EXCLUSIVELY BY NEGROES DURING SIX YEARS.

find here two individuals owning and operating brickyards. Colored people for years and years have been operating brickyards for other people and it was highly encouraging to meet here two men who had grasped the American principle of things, that of advancing from common laborer to owner and operator. With a business amounting to $16,000 per year, R. E. Clegg, manufacturer of all kinds of brick, turns out per season about two million brick. But the pioneer in brick making in Durham is R. B. Fitzgerald. Beginning thirty years ago, Mr. Fitzgerald has supplied the material for many of the largest brick structures in the city. I cannot refrain from emphasizing once more the absence of color discrimination in a work of this sort. This case in particular warrants it, as Fitzgerald owes his success almost entirely to Southern white men. One man in particular, Mr. Blackwell, the great tobacco manufacturer, said to him, "Fitzgerald, get all the Negroes and mules you can and make brick. I will take all that you can make." Fitzgerald followed the instruction and today he not only turns out 30,000 brick a day from his $17,000 plant, but owns besides 100 acres of land within the city limits and has $50,000 worth of real estate.

A Negro bank is no longer a novelty, there being more than fifty in America at the present time, but the one at Durham, in addition to carrying resources of $400,000 and deposits of $20,000, is an instance of what the white Southerner often does to help Negroes. When this bank was opened, the cashier and teller of the leading white bank came over and without charge, helped the colored bankers open and close their books.

With all this prosperity, with flourishing insurance companies, a bank, brickmasons and men in the professions, it was not remarkable that this class of persons should own beautiful homes. It was more of a question of overdoing than not doing enough in their furnishings. And so while I was now ready to believe anything about the prosperity of Durham

Negroes, I was curious to see if wealth had driven the people into extravagance. Far from it. With electric lights, steam heat and baths and all the modern equipments, these residences presented a modesty of taste that was more than gratifying. No baubles, no tinsel of furnishing that often represent the abuse of wealth, but conservative and tasteful furniture I found everywhere. Wealthy negroes like Dr. A. A. Moore, C. C. Spaulding and John Merrick could have fitted up their homes to dazzle the eye and evoke the envy of both white and black, but instead they have rather set a standard of good taste and good judgment to all who know them.

I must here call especial attention to Mr. John Merrick, recognized as the leading Negro of Durham. Mr. Merrick began as a poor man, borrowing money from General Julian S. Carr, a leading white man, to begin his first business. During all the years he has lived in Durham, he has continually expended time and money to promote the interests of colored people, aiding them in securing homes and in establishing organizations of protection. In 1883 he founded the Royal Knights of King David and in 1898 he founded the North Carolina Mutual and Provident Association. He aided in establishing a hospital here for Negroes, is a trustee of the bank, a steward in the St. Joseph A. M. E. Church and president of the Christian Endeavor League. In addition to this he is the largest Negro owner of residence property in the city, collecting per month rents amounting to $550. That all this draws no envy from the white people is illustrated by the fact that a few months ago at the marriage of his daughter more than three hundred of the best white people were present, bringing with them costly presents for the bride.

But with all this prosperity, some doubt still assailed me. The exceptional man is everywhere and among all races. He has always been in evidence among the people of my race. In slavery days one Negro could gain his freedom and himself become a slave owner while his own brethren remained in bondage. These Durham men of whom I am talking had had their opportunities. They had been to college, to medical schools, to dental schools, to schools in the North, enjoy-

THE ONLY HOSIERY MILL IN THE WORLD OWNED AND OPERATED BY NEGROES.

THE MEN'S DORMITORY AT THE NATIONAL RELIGIOUS TRAINING SCHOOL AND CHAUTAUQUA.

ing everywhere contact with the best minds and spirits that the nation possessed. It was not so much wonder after all that, given a fair chance, they could create and develop enterprises and enjoy the blessings of life.

But what of the poor man, the unlettered man, the man against whom because of age or adverse circumstances, the door of training had been tightly closed? What was he doing and how was he living? This was my last question put to the city of Durham. If it could answer me this satisfactorily I would yield; because I knew that in this query lay the crux of the whole race situation in the South; for it is with this class that the white people of the South have to deal, and upon the conduct of this class that the real estimate of my race is generally formed.

It is written that we have the poor always with us and it was this poor that I wished to see. I drove through their section of the city, observing closely their homes inside and out, their yards, their fences, their window curtains, their furniture, and I own that in many cases I almost doubted my eyes. The one time hovel and the shack with rags sticking in the windows and fences rotting away, with little gulleys washed in the yards and half clad children standing in front of the door were all gone. I saw no dead dogs or cats or dead fowl in the streets as I sometimes see in our larger Southern cities and I sniffed no feverish odors from dens and dives. Neat cottages stood where in many cities still stands the tubercular shack, and well cared for children in clean yards, many of which were adorned with flower beds, everywhere greeted me. There were windows with clean curtains and clean shades and substantial furniture devoid of the cheap shimmer of the installment house,

Surely I felt there must be something at the bottom of all this and I set myself to inquire what was the secret of this general healthy appearance. Of course, the wealthy doctors, the prosperous

school teachers and well-to-do ministers were no longer a mystery or a surprise. If the so-called poor were thus situated the professional man, I well know, was bound to flourish like the proverbial bay tree.

As this was the class that came most in contact with the white people I asked what was the general spirit existing between the two races. Of all the Southern cities I had visited, I found here the sanest attitude of the white people toward the black. Disabused long ago of the "social equality" bugbear, the white people, and the best ones too, never feared to go among the Negroes at their gatherings and never feared to aid them in securing an education or any kind of improvement. I have already stated that the wealthiest and best thought of Negro in Durham began his business career upon a loan of money from General Julian S. Carr. Perhaps a still stronger instance is that of the Duke family, the famous tobacco manufacturers. The members of this family have always given generously to support the colored schools and churches of the town, and Mr. Washington Duke during his lifetime took such interest in and attended so regularly the African Methodist Episcopal Church, that the colored people counted him as one of their own members. This is a glowing example of what I mean by a sane attitude toward the colored people. If the white people thruout the South, indeed if the employers everywhere, would encourage the Negroes by their presence and personal interest in their undertakings, there would be day by day fewer complaints of the dissolute Negro laborer and the trifling Negro servant. Nobody, white or black, has ever argued that Mr. Washington Duke was in any way contaminated by his contact with the African Methodist Episcopal Church; rather the Negroes are inclined to vie with the whites in doing his memory honor and reverence.

Another example of the substantial encouragement the white people of Durham give the Negroes is found in the attempt last summer to found in the city a Negro Chautauqua. When the colored

LINCOLN HOSPITAL: A GIFT OF WASHINGTON DUKE.

people showed that they were really in earnest, Dr. James E. Shepherd, founder of the school, laid his plans before the white people, who immediately took steps to aid him, the Merchants' Association and Mr. B. L. Duke donating to the institution twenty-five acres of land valued approximately at $7,000.

The white people here further show their fine spirit by holding open everywhere the door of opportunity to the Negro. Ignoring color or race, they demand only efficiency. I never saw in a city of this size so many prosperous carpenters, brick masons, blacksmiths, wheelwrights, cotton mill operators and tobacco factory workers among Negroes.

In the larger white mills and the like the Negroes in several instances are the only ones employed. The hook and ladder company of the fire department is manned entirely by black men, showing not only a liberality of spirit, but a recognition that courage can lodge in the breast of a black man as well as in that of a white man. I have referred to the hosiery mill owned and operated solely by Negroes; there is one here also owned by a white man, but operated exclusively by colored men. The proprietor is Gen. Julian S. Carr, to whom I have already referred. General Carr employs 150 women and a few men, and it argues the generous spirit typical here that he was willing to admit a rival Negro mill right here in his neighborhood, many of whose workmen had received their training from him.

But the company that has done most for the Negro, both in employment and in general help, is the W. Duke, Sons & Company, branch of the American Tobacco Company. This company employs more colored laborers than any other firm in the city, keeping steadily at work 1,548 negro men and women, at an average of 93 cents per day, or paying out $1,400 per day or $440,000 a year to colored people. And it is highly to the credit of the colored people that thru all the changes in the system and in the introduction of new and complex machin-

ery they have been able to hold their positions and give increasing satisfaction to their employers.

Indeed this satisfaction has been so genuine that the American Tobacco Company has for some time been pursuing the policy for its colored employees, which, if adopted by many of our large corporations thruout the country would spare the nation many strikes, lockouts, bloodshed and the suppression of general prosperity. This company has established an employees' bounty, which upon the death of the employee, is paid to the latter's family. The company donates in cash to the person who has been before designated by the employee a sum of money equal to the wages paid to the deceased during the last year of his life; not exceeding, however, in any case, the sum of $500. Tho recently inaugurated this scheme has already allowed to be paid out more than $3,000 to the beneficiaries of the colored employees. In addition to this the company takes cognizance of its employees' health, seeing, no doubt, that better health conditions insure a constantly higher grade of service. The Lincoln Hospital here, a place for the sick colored people and for the training of colored nurses, received its grounds and building, valued all told at $75,000, from Mr. Washington Duke, the founder of the Duke Tobacco Company, and it is in co-operation with this hospital that the firm is now taking active interest in the improvement of the home life of its employees by securing a visiting nurse to work in the Negro section of the city. That thruout all the Negro efforts in Durham these companies have been willing to entrust their money and donations of buildings and grounds to the hands of colored men shows how thoroly established is the confidence of the white men in the honor and efficiency of the Negro doctor, the Negro school teacher and the Negro minister.

Nothing in all this appealed to me more than the information that the white people everywhere encouraged the Negroes to buy and own property. Surely nothing binds a man to the general welfare of a community more than to tie up his interest there in a piece of property, no matter what kind it may be. That so large a proportion own their homes, that the most of those renting rented from Negro landlords, that the southern part of Durham was inhabited almost entirely by colored people, and that Negro possessions in the city amounted to one million dollars, was the key that unlocked for me much of the mystery of prosperity and good feeling between the two races. Two or three far-sighted white men had encouraged some few struggling Negroes to invest in a piece of property. The influence spread itself until out of men whose spirit was comparatively indifferent to their surroundings have been molded loyal, patriotic, law-abiding black citizens.

I found as a result of an interview with several of the white men of the town that the good opinion of the colored men was growing more and more general. Mr. W. T. Bost, the city editor of the Durham *Herald,* spoke in the highest terms of the general thriftiness of the colored people. Mr. Bost, as it happened, had lived in a number of other cities in the State and it was his experience that the Negroes at Durham were more law-abiding than in any other city in which he had lived. There was also less vagrancy here than in any other city. And indeed this might well be, for at the very moment of this interview, Mr. J. F. Freeland, chief of police, was making an active canvass among the colored ministers and others of influence to assist him in a movement to improve further the condition of the lower class of colored people. But to continue with Mr. Bost, the city editor said that it made no difference in Durham when it came to business. "Fitzgerald," he continued, "makes better brick than any other man in town; therefore the people buy Fitzgerald's brick. The Whitted Graded School makes the best furniture in town and so it is always in demand at a good price."

Major W. A. Guthrie, one of the leading lawyers of the city, stated that there was a better feeling between the races than in any other city in the State. "Conditions here," he declared, "are pleasing to both races. The whites have learned that it pays the town to have educated

ministers and teachers and such colored business men as John Merrick." Major Guthrie, it may be said here, was for a number of years chairman of the City School Board. Some thirty years ago, on the day that, as chairman of the board, he selected the spot on which to erect the Whitted Graded School, a race riot was taking place in a nearby town. Major Guthrie said to the other members of the board, "I think it is better to buy land and build a schoolhouse for the Negroes than to shoot them down." Thirty years of experience has proved that he was correct.

TUSKEGEE, ALA.

Listen, Brothers!

BY MARGUERITE OGDEN BIGELOW

LISTEN, brothers, for I claim your attention, in behalf of your sisters and mine!

In primitive forests we fought the wolves to protect your children, and when clans were born out of social chaos we founded industry in the open field and in the cave that was home.

In the days of despots we sweated and suffered with you, and not less than you. We bore the taskmaster's lash on flesh made tender in your service. Our wounds festered in the sun.

In ages of intolerance and superstition we were persecuted, as you were, for Truth's sake, sawn asunder, burned as witches, fed to ravenous beasts, martyred in vile ways innumerable.

Throughout all ages we have shared your poverty and your mischance, your doubt and your sorrow, your oft thwarted passion for beauty, love, advancement, freedom and ideals.

We have borne you and suckled you, rocked you in cradles, carried you from place to place, on our backs and in our arms, nursed you in sickness, fostered you in health, inspired you in battle and comforted you in death. There has been no darkness thru which we have not gone with you hand in hand.

But now you are coming into your own proud heritage, my brothers, and a new morning dawns, gladdened by freedom and opportunity. Have we no share in the morning?

By our blood and by our tears freely spent for you, by our labor and our births, by our love inexpressible, we claim fullest human rights in this your morning of freedom.

Listen, brothers, for I speak for all your sisters, for the weak as well as the strong, for those who understand and for those who do not understand, and I say,

Give us a share in your Democracy, that we may show you ours!

SUPERIOR, WIS.

Desertions from the Army

BY A RETIRED OFFICER

HOW to discourage desertions from the army is a question which has been debated in military circles for many years. That no conclusion has been reached which points to results of lasting benefit to the service is, perhaps, not surprising. Just now the subject is somewhat conspicuously before the public in the magazines and newspapers. In his annual report, lately published, Secretary Dickinson, of the War Department, discusses it at some length, but in a manner not likely to be quite satisfactory to the citizen without army affiliations. He has more to say about the eager pursuit, inevitable capture and rigorous punishment of deserters than about the causes for desertion or their correction. From his report, however, we learn that the number of desertions in 1910, up to about the 1st of December, was 3,464, or 3.66 per cent. of the total enlisted force, and it is deemed a cause for congratulation that it compares favorably with the 4.97 per cent. of 1909. Such fluctuations, comparing one year with another, are unimportant. The fact remains that, during the past twelve years, about 50,000 soldiers have deserted, so that the total for 1910 represents a fairly constant average.

From the point of view of the army officer, desertion is both inexcusable and inexplicable. Perhaps, if it is studied from the point of view of the enlisted man, the questions it suggests might easily be answered. The testimony of both would be to some extent *ex parte*, and strongly colored by class prejudice. I feel the better qualified to discuss it with something like judicial impartiality by reason of the fact that, in the course of a somewhat eventful life, I have occupied both standpoints, beginning my military career by enlistment as a private, and ending it with field rank won by hard work, and without skipping a grade. While by no means the only one who has done as much, or more, the number of those promoted from the ranks who have gone beyond a first lieutenancy is not great. Comparatively few of the young men who enlist have had the elementary education needed to enable them to qualify for commissions. The exceptions are mostly wayward sons, the "black sheep" of their families, who in one way or another have sinned beyond hope of easy forgiveness, and in a moment of penitence and dejection have elected to efface themselves by enlistment. Such young men commonly lack the character and capacity for self-restraint which are indispensable to a successful military career. Recruits from the farming districts or the industrial centers rarely have the ability to study the subjects they must learn thoroly to permit their claims to be considered by an examining board.

In years of peace enlistments in the army are largely made up of three well-defined classes. By far the largest class consists of young men with little education and no special training in any line of profitable industry, who, finding the restraints of home irksome or its opportunities unattractive, seek the cities in search of employment. Not finding it to their liking, and perhaps not at all, they are confronted with the alternative of playing the role of the prodigal son without the agreeable accessories of the robe, the ring and the fatted calf, or of enlisting, so they don the uniform. As the rule, they are healthy and well-disposed lads, with undeveloped chins, and are the best of the recruits secured. The next class is composed of confirmed prodigals who are weary of husks, and for whom nothing in the way of choice remains save enlisting or becoming tramps. Not a few of them have tried amateur tramping and found it anything but pleasant. As the rule, they do not care a great deal what becomes of them, if assured regular rations and a little money at intervals for such dissipation as there may be opportunity for. They are generally undesirable recruits and rarely make good soldiers. A third class comprises those who are somewhere "wanted" for minor violations of law, wrongdoers in a small way, by the accident of circumstance rather than because of a criminal bent. Lacking the courage

to face the consequences of their conduct and perhaps considerate of parents and relatives, they enlist in haste and it may be repent at leisure. Most recruits do. A few are gained from sources outside of these classes, but their number is not great enough to entitle them to separate classification. Part of this annual ingathering is very good material, especially those of the first named and largest class, but the recruiting officer gets a great many from whom about all that can be expected under present conditions is reluctant service and irresponsibility.

There will always be deserters, and no penalties can be devised which will be wholly deterrent. The experienced and observant company officer can usually pick out those likely to desert when opportunity offers, and if really interested in his men will do all in his power to make self-respecting soldiers of these human invertebrates. Not always can he succeed, but success is possible in more cases than would seem probable to one who has not seriously made the attempt. The guardhouse is an extremely poor training school for the soldier. The man likely to desert responds to the sick call on any plausible pretext, and displays no little ingenuity in devising expedients to shirk military duty. The consciousness of official distrust and disfavor operates as a perpetual deterrent from effort to rehabilitate himself, and he soon comes to feel that anything is better than dragging out to the bitter and indescribably weary end the term of his enlistment. To the conscientious company officer such a man is a constant anxiety, and when finally reported "absent and unaccounted for" he is likely to consider it rather a cause for congratulation than for regret. It probably never occurs to his captain that he is himself in any degree to blame for the deserter's failure and disgust with the service, but in the last analysis it may be found that he and his lieutenants are chiefly responsible.

It often happens that ill-advised and unintelligent severity of discipline drives to desertion men who would not otherwise have thought of it. The martinet is rarely a good officer, and is much more likely to spoil the average man than to make a good soldier of him. No captain who keeps his company well in hand and establishes a reputation for kindness of heart, human sympathy and level justice without favor or weakness, needs to be a martinet to get out of his company the best there is in it. Deserters of the better class are usually driven to desperation by official brutality, not often of the kind which a regimental or brigade court martial would feel itself called upon to deal with, but intolerable to sensitive men and utterly subversive of the best interests of the service.

My study of the question of desertion has led me to believe that the reforms most needed in the army must begin with the line officers. The unit of military organization is the company. Without good companies good regiments and good brigades are impossible. Each company has a captain and two or more lieutenants, according to the branch of the service. All below the rank of lieutenant are enlisted men. The non-commissioned officers—sergeants and corporals—must be selected from the ranks, and men fitted for these positions are not always to be found. As a matter of fact, however, the character and efficiency of a company is more often than otherwise what its non-commissioned officers make it. Often a great deal too much is left to them because it is easier for the commissioned officers to delegate authority than to exercise it.

To change all this would involve measures of reform which the line officers would doubtless resent as derogatory to their dignity as gentlemen. But exactly those reforms are demanded. No line officer is fit for the position he holds if content with the performance of the prescribed duties of his rank, and willing to leave pretty much everything else to his first sergeant. Certainly he is not commissioned to loaf in his quarters, drink commissary whisky, play cards and read novels until it is time to assume his best regalia for dress parade. The regimental commander who does not feel it incumbent upon him to make it clear to his line officers that he means to hold them individually responsible for the discipline, efficiency and health of the men immediately under him invites retirement. It should be understood that there is no time in the twenty-four hours when at least one company officer is not to be on duty at the company headquar-

ters, and in personal touch with everything that happens. The captain should know every man in his company at least as intimately as the conscientious teacher knows the pupils of his class. He should make it his business at all proper times to be much with his men, not in a way involving any sacrifice of personal or official dignity, and certainly not in a way to invite characterization by the small wits in the ranks as "a little tin god on wheels." He needs to be a soldier at all times. He should recognize worth and efficiency among the men, and make those who show these qualities feel that the difference between them and their officers is not one of caste or "divine right," but an accident of circumstance, and that the soldier who tries to be a gentleman is entitled to expect, and will receive, the treatment due a gentleman. The slouch and the shirk should be called aside and talked to kindly but firmly. The effort should be to make it appear to them that fidelity to duty is the path of least resistance; that the standards are not too high for the general good, and the welfare of the service; that any man who is a good soldier, with the respect and confidence of his officers, finds life easier and more comfortable than one who is not; and that the man who can do his duty and will not, has only himself to blame if it goes rough with him. In all matters of soldierly deportment, gentlemanly speech and prompt attention to duty, the captain should be the exemplar and should exact from his lieutenants like behavior in all circumstances. Punishment should never be inflicted without ample reason, and by order of a non-commissioned officer only when such non-commissioned officer is in command. Even then it should consist of nothing more formidable than detention in the guardhouse until the titular commandant can be communicated with. The greatest care should be taken to avoid anything which looks like injustice. This would tend to place a wholesome check upon petty tyranny on the part of the non-commissioned officers, and that result attained, the principal cause of desertions would disappear. It is possible only when the captain of a company knows so much of his men, their characters and their actions, that he cannot easily be misled by false reports, or made the agent for the gratification of spite and malice.

The response to the morning sick call is a very good indication of the general condition of a company and the way it is looked after. If a company commander does not know how to keep his men well, any army surgeon would find pleasure in telling him. There should be in every post a school for officers in the hygiene of the barrack, tent and mess room or company kitchen. Regimental and post commanders would find it instructive carefully to examine the daily reports of the sick call by companies, and if in any case the quota of a company is larger than it should be, a little discreet "jacking up" of the captain or lieutenant commanding would be repaid.

There are police duties connected with camp life which are more or less disagreeable of performance, but they are necessary, and may be dignified if undertaken in the proper way. No company officer should for a moment hesitate to take part in the sanitary policing of so much of the camp as his company occupies, and of such other parts as are for the common convenience, and to see that no one neglects any duty to the disadvantage of the men for whom he is responsible. It should be his business to know the food supplied to his men is sufficient and of good quality, that it is properly cooked, and served as well as possible. To accomplish this he must give these matters personal and intelligent attention, never relaxing his vigilance. He should carefully avoid asking or demanding of one of his men a personal service of a menial character. To see an enlisted man wheeling the perambulator of an officer's baby, or doing housework for an officer's wife, is not a sight calculated to stimulate martial enthusiasm. Those who do not want to perform such services should not be asked to do so; those who do, should be made to understand that they are soldiers and not housemaids or nurses. The officer who imposes such tasks upon enlisted men should be promptly courtmartialed, and, if found guilty, given a chance to resign. Dishonorable dismissal would, perhaps, be too drastic a corrective of an ancient abuse.

How is it with the typical line officer of today? He enters the service from

West Point, or by appointment from civil life through political influence and favoritism. The moment he dons the uniform of his rank he becomes a superior being. To notice an enlisted man is sometimes a disagreeable duty, but invariably it is a gracious condescension. He breathes a different atmosphere, walks on a different plane, and if of a devout habit—which he seldom is—thanks God with unction that he is not as other men of the grade below the dividing line which separates him from the enlisted. He is an officer and a gentleman; they—well, they are just men. Perhaps it would not be an exaggeration to say that he looks them over as the farmer might his horses, cattle and swine, and rates them at much the same relative valuation, since a horse is worth more than a steer, and a steer than a hog. His time is passed largely in self indulgence, and, if required to perform military duty and exercise command, he curses the disagreeable necessity and disposes of it as lightly as he deems safe. With his associates he discusses chiefly the conditions which favor promotion. That he should earn advancement by the faithful discharge of his initial responsibilities rarely occurs to him. He is as much away from company headquarters as the post rules will permit, and welcomes taps, since he may then "sit into" a congenial game and get as "full" as he pleases, while assured that his noncommissioned subordinates will see to it that all lights are out and quiet reigns in the quarters of the inferior creatures of his command. With more or less profanity he awakes reluctantly to the duties of the succeeding day, dispenses what he is pleased to call justice at the suggestion of his first sergeant, conducts a drill if he must, and disappears until he emerges resplendent for the great ceremonial function of the day. Meanwhile his company shifts for itself. He is not a coward, and would resent being called a shirk. If the long roll sounded he would be at his post, ready to die if necessary, but then, as at all other times, incapable of commanding effectively, for the reason that between himself and his men no sympathy exists, and he is obeyed because obedience is the duty of the soldier, even tho the soldier thinks that the man who gives the order is incompetent and a fool. He may have passed his examinations with credit, and know a great many things which are hidden mysteries to those less favored with opportunities for education, but he knows very little of what an officer in command of troops should know, and seems, as the rule, quite indisposed to learn it. His men rarely take him quite seriously. If he is easy going, they laugh at him; if he mistakes unreasoning severity for discipline, they hate him. Rarely do they respect, and still more rarely love him. That he cares very little what they think of him is the best evidence that he is unfit for the position he holds. In time and with larger responsibilities, less directly connected with the interests of enlisted men, he may become useful and serviceable to his country, but never as completely as if he had begun his career by learning thoroly the duties of the company officer and getting into touch with the enlisted man, who, after all, is the army.

Do I exaggerate? I think not. It is because subalterns and captains are not made immediately and directly responsible for the welfare and contentment of their men, and that it is possible for coarse natured and often brutal "noncoms" to exercise the authority they should not have, that the army is demoralized and desertions are a national scandal. It is for exactly this reason that our Spanish war was a horror, not because its battles were in any sense important, but because every camp was a Golgotha, and men rotted in filth for the reason that neither they nor their officers knew the first principles of self-protection. Had the severest penalties known to the law for criminal negligence been visited upon some thousands of line officers when that war ended, it would have been its proper finish.

If the dignitaries in Washington really desire to know how the service may be made agreeable to enlisted men, they need be at no loss to learn. Every problem which now bewilders them was solved sanely and practically about one hundred and twenty years ago by the cleverest of Americans, Benjamin Thompson, the New Hampshire farmer's son, who became Count Rumford of the Holy Roman Empire, and whose work in Bavaria is, perhaps, the most re-

markable chapter in the world's history. This extraordinary man reorganized a demoralized army of conscripts, made it self-supporting and a national blessing, inspired every man in its ranks with a wholesome pride in his uniform, and made enlistment desirable for all who were eligible. This could be done again, but not while politics subordinates patriotism and the Congress has reasons of its own for preferring existing conditions.

Is Christianity Ethics or Religion?

BY SIMON N. PATTEN, LL.D.

AUTHOR OF "THEORY OF SOCIAL FORCES," "HEREDITY AND SOCIAL PROGRESS," "THE NEW BASIS OF CIVILIZATION," ETC.

CHRISTIANITY has had a long evolution and many opposing interpretations. Of its many crises none has been more important than the one it is now facing. The theory of evolution has undermined familiar doctrines and has made uncertain old plans of defense. A strong tendency has therefore arisen to reshape Christianity in such form as to enable it to avoid the attacks of science. Christianity, it is said, offers the ethics of Christ as its fundamental proof. Why dispute about cosmic dogmas and biologic origins when a realm of such magnitude is open for occupation? Many have accepted this easy road to success and even assume a tone of superiority over those who will not walk in the path offered by scientists. It seems important, therefore, to accentuate the difference between ethics and religion so as to estimate the loss as well as the gain following from the identification of Christianity with ethics.

At the start we find that ethics is not a unified realm, but a composite made up of distinct parts. A large part of its field is better described by calling it culture. All education is cultural and makes its appeal thru history, language and art. The organ of culture is thus not the Church, but the school, the college, the theater, the opera and the art gallery. The department store and the street offer more cultural education than does the Church. Even church people get their cultural standards from secular institutions. Culture does not need the Church. It is carried along as a part of our social atmosphere, and thru its all-pervading influence is a factor in social uplift. Culture is its own reward; it demands neither sacrifice nor missionary zeal. Culture progress will go on as well without the Church as with it. If the Church has no other mission, church doors will soon be closed.

A second element in ethics is personal goodness. By this I mean the qualities that each one manifests in his personal relations. Goodness means the suppression of primitive instincts and the elevation of good will, sympathy and love into the supreme place. Anger, envy, passion, brutality and greed must be displaced to create the social bonds that make society happy and prosperous. But what agents affect these ends and what is the part played by the Church? The prime factor would seem to be social intercourse. The isolated man may indulge his primitive instincts without serious detriment. War, struggle and strife are universal conditions in early society, and those succeed best who act in a forceful way and dominate thru their energy and power. Peace, commerce and industry alter the conditions of survival and give the advantage to those who are friendly and sympathetic. No one can enter effectively into co-operative enterprises who does not suppress expressions of passion and smile at what in a primitive man would excite anger and strife. Modern goodness attains its best expression in family life. The primitive family was dominated by the man, and permitted him to retain his boorishness at the expense of wife, children, servants and retainers. Today the family has no ruler, but is held together by bonds of affection and interest. This means the disruption of inharmonious families, but

at the same time it brings out goodness, restraint and love in those families where harmony dominates over disruptive antagonisms. The personal character of modern peoples has been molded by the need of social and family restraint. Goodness has gradually displaced primitive self-assertion and there is no likelihood that it will lose its control so long as social and family life have their present organization. The Church is a negligible factor either in the change or in its perpetuation. Goodness will become more emphatic with each increase of social co-operation and family affection. The crowded street car that brings out a smile instead of anger at common ills does more to develop personal goodness than the Church can do with its most effective preaching. Goodness comes from contact, not from argument or appeal.

A third element in ethics is industrial morality. Habits are acquired that increase efficiency and inculcate sound principles of conduct. The basis of this development is utilitarian. Interest and personal advantage are the prime motives for adopting the moral code that brings success in industry, trade and commerce. Back of honesty, frugality, temperance, punctuality and like virtues is a force that steadily increases their power and induces more people to live up to their demands. Personal advantage will always be the motive for their acquisition, and no outside agency can in any material way modify their workings.

Ethics is made from three elements—culture, personal goodness and industrial morality. Each of these has special agencies for its perpetuation that in the main are independent of Church influence. These agencies fail to make ethics a force controlling every one, but there is no reason to assume that they will not be increasingly effective with every improvement in social conditions. If the Church is to perpetuate itself it must seek some other basis than that which comes from doing work which other agencies can do better. Christianity as ethics would die out; it must remain a religion and fight the battle of religion to keep the ascendency it has won. What, then, is Christianity as religion?

The difference between ethics and religion is that ethics has to do with social advance, while religion has for its problem social reconstruction. The theme of the religious teacher is always that of lost ground to be regained by energetic action. We have fallen, but we may rise again; we have sinned, but we may be redeemed; we are depraved, but we may be made pure; we are degenerate, but we may be born again. These are the contrasts found in all religious doctrine. It is not the thought of a steady rise thru normal agencies, but of bitter defeat, the danger of a fall and the hope of a glorious victory. The regenerative agencies are thus made emphatic and more attention is given to the social outcast, whose actions and character justify his doom, than to the man with many virtues. Nature rewards success and eliminates the unfit. Is a scheme that would burden the virtuous and make the sinner his equal worthy of consideration? Why cannot the world be made better more rapidly by favoring the good than by elevating the bad? These questions have to be answered to justify religion. It will fail if the social wreckage due to past conditions cannot be reconstructed; if the unfit cannot be made over; and if the social outcast cannot be elevated into full brotherhood. We must either eliminate or succor the unfortunate; with our decision religion is either displaced or raised into a commanding place among redemptive agencies. If there has been no fall, the increasing force of culture and morality, coupled with a steady elimination of the unfit, will elevate man and gain for the race all that progress can give. Only strong retrogressive tendencies justify a religious program.

The proof of this first premise must be sought in science instead of in myth, tradition and scriptural authority. Depravity as a doctrine has lost favor, but if degeneration be put in its place, the same thought is advanced in a form that commands support. It is admitted that the physical improvement of the race has ceased. Social improvement continues; but if new and better physical traits cannot be developed in men, social progress will also cease. There are many ways of stating this fact, but the one most readily understood is the claim

that the elimination of the unfit has been thwarted by the action of human sympathy. In the primitive world the weak and defective failed in the struggle with the strong, and thru their elimination the race was gradually improved. Now, thru the many agencies for keeping the weak alive, the level of the race is lowered. A fall or degeneration has thus set in which needs active counteraction.

Such are the facts. Shall we by favoring the strong build up the race, or can religion by checking the fall open up a road to progress? The two plans are thus brought into sharp contrast. Either the self-centered, aggressive man will dominate thru exploitation of the weak, or the strong must accept service rather than personal advantage as an ideal, and work for a social uplift that counteracts degeneration. The first program is that of the superman who is evolving an ethics justifying his aggression. The second is that of Christ and of religious reformers.

To make a program of service effective the causes of degeneration must be found in social conditions instead of in personal depravity. If vice is a condition imposed by poverty, misery and disease, society can remedy these defects and permit the natural qualities of the weak to assert themselves. Evil and sin have local definite causes, usually economic in origin. These energy, forethought and co-operation can remove. Religion can offer a remedy for the present situation if it induces the economically prosperous to work for society instead of their own aggrandizement.

Christ's ideal never was so practical as today. Its application is much clearer in an economic world like ours than it was in a degenerate age like the Roman, when service meant only the palliation of distress. The whole energy of society can now be turned toward social reconstruction. The root of all evil being in the environment, service can set the wheels of progress in motion and elevate humanity into a normal state.

This is the first plank of the religious program. The second is equally important. Social work will not attain its end unless social justice is made its complement. Service can give but temporary relief unless justice limits the future aggressions of the strong and keeps for the public the rights each age should receive from its predecessors. Each generation has its birthright; each individual his duties. Religion must combine the righteousness taught by the prophets with the social service emphasized by Christ to get an effective program for twentieth century activity. Culture, goodness and morality will remain the possessions of the few unless service and righteousness are raised above them by a revival of religious zeal.

Such is the social program of religion based on an analysis of present evils and appealing to the deepest and purest human emotions. It has also a personal program which lifts man above the social into touch with the divine. The full man is not made active by service unless inspiration evokes all of his powers. Man becomes the superman not thru personal aggression, but thru the consciousness of divine love. Fellowship with God completes the force that carries the believer beyond the normal and gives him the faith that makes him a leader. God needs prophets to make his love effective and to interpret to the less fortunate the books of nature and of revelation. *There is but one true God and you are His prophet.* This doctrine arouses more power, earnestness and devotion than any other claim of religion. So long as Mohammed, Paul, Calvin or Wesley is thought of as the true prophet who interprets religion to the less favored, tradition will control the Church; servility will characterize its members.

Thru inspiration we can all be supermen and see the promised land into which the race will enter. To be first over the border and to return with a message of cheer to those of good intent but of less courage is an ambition every one should foster. First service, then justice and then inspiration; this is the gospel of religion. Why should we stop with culture, goodness and morality when a nobler goal is plainly in sight? The difficulties and opposition it evokes are worth the sacrifice. The superman is coming, but he will appear as the embodiment of service and not as a self-satisfied exploiter. "He who would save his life must lose it."

UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA.

An American Opera in Boston

IF, as many believe, the great American novel has not yet been written, it is hardly to be wondered at that in the realm of operatic composition, which is so much younger an art than the writing of fiction, so little that is worth while has been done in this country. The late John K. Paine, of Harvard, devoted the last ten years of his life to writing an interesting operatic score entitled "Azara," which has been printed by Breitkopf & Härtel, in Leipzig, at a cost of $2,000; but, unfortunately, it still awaits its first hearing. Walter Damrosch (who, tho born in Germany, may be considered an American by right of long residence) was somewhat more fortunate. At the time when he was the manager as well as the conductor of an opera company, he kindly accepted for performance his own "The Scarlet Letter" and produced it in Boston and New York; but no other manager has had the courage to follow his example.

More than half a dozen other attempts have been made in New York and elsewhere to launch home-made operas, by W. H. Fry, Pratt, Gleason, Coerne, Howland, Hadley, etc., but never with lasting success. Two Americans, Henry Waller and Arthur Nevin, have had the distinction of having their scores produced at the Royal Opera in Berlin. Mr. Nevin's "Poia," indeed, came near being a *casus belli* between Germany and America, as the chauvinists hissed it because the Kaiser had ordered the mounting of this opera by a mere American when so many supposed German masterworks were eager to emerge from their manuscript stage. "Poia" was sung five times and then shelved; but it is worth while noting that two such eminent experts as Humperdinck (whose "Königskinder" is the "star" opera of our present season) and Carl Muck were in favor of its production. Dr. Muck, by the way, is to return to Boston next season as conductor of the Symphony Orchestra.

The Boston composer, Frederick S. Converse, succeeded last season in having his opera, "The Pipe of Desire," accepted by the directors of the Metropolitan Opera House. It has not been revived this year because it proved to be an immature production, not sufficiently entertaining in either its plot or its music to survive in the operatic struggle for existence in our fastidious metropolis. In Boston it has been, however, sung this season; and there, also, Manager Russell staged the same composer's new opera, "The Sacrifice." Like Paine, Mr. Converse wrote his own libretto in this case—a procedure not to be commended as a rule, for up to the present time Richard Wagner is the only composer who has proved to have a right to be classed with dramatic poets.

The plot of "The Sacrifice" is simple and not ineffective, except in the first act, which is too devoid of happenings. The scene is placed in California, in 1846. There is an American officer, Burton, who, in accordance with operatic tradition, is a baritone, for he loves in vain the Spanish beauty, Chonita, who, as a matter of course, prefers the tenor, Bernal, a Mexican officer. In the end Burton sacrifices his life in order that Chonita may marry her lover and be happy.

The present writer did not witness the performance in Boston, but, judging by a perusal of the printed vocal score and the remarks of the Boston critics, Mr. Converse has made a step forward without quite reaching the goal. He is still a writer of good symphonic music rather than of dramatic; he knows how to orchestrate much better than how to originate vocal melodies that speak to the

heart or that are closely associated with the moods of the story. However, he may console himself with the reflection that this is only his second opera, and that even the illustrious Verdi had to try five times before he won a success (with "Ernani"), and that Mascagni has written nearly a dozen operas, only one of which has "caught on" with the public.

Victor Herbert's "Natoma"

Victor Herbert has every reason to be satisfied with the success, so far, of his first grand opera, "Natoma." Its first seven performances — in Philadelphia, New York and Baltimore—were given before crowded audiences. It had the benefit of the popularity of Mary Garden, Mario Sammarco and John McCormack, and of the indefatigable conductor, Cleofonte Campanini; but even with these advantages it could not have been floated had not its inherent merits buoyed it up.

Nor could it have succeeded if the libretto had been so unsatisfactory as most of the critics said it was. Abusing the libretto is a favorite amusement of the musical journalists; it is so easy to take a few detached verses and make fun of them. Mr. Redding, who wrote it, must have been equally amused and consoled when one of the speakers at a dinner to Victor Herbert a few days after the first New York performance of "Natoma" recalled the fact that, after the first performance of Wagner's "Tristan and Isolde," prominent German critics had written of it: "It is the most unfortunate choice of a textbook ever made by a really prominent composer." "The first act is intolerably tedious." "Considered purely as a poem, few will be able to read it without comic emotions." "The poem is in every respect an absurdity."

Very similar things were printed about "Natoma," and while its libretto is very far from being a "Tristan," which has been called "a poem for poets," it by no means deserves the onslaughts made on it. It is foolish to judge an opera book by purely literary standards; its verses are written for music, which softens its defects and enhances its beauties. The main question is, therefore: "Has it a coherent plot and does it give the composer sufficient opportunities to write effective dramatic music and lyric episodes?"

Both these questions must be answered in the affirmative. Joseph D. Redding, the writer of the libretto, being a Californian, naturally chose his State as the site of the plot, not only because it is the most romantic of all our States, but because it afforded the composer chances

AN AMERICAN OPERA: A SCENE FROM "NATOMA."

to write music in the Indian and Spanish style as well as in that peculiar to the white man. The heroine, Natoma, is an Indian girl, the last of her tribe. She is the companion of Barbara, a beautiful Spanish girl, the daughter of Francisco de la Guerra, who dwells on the island of Santa Cruz, off the coast of Santa Barbara. Natoma has fallen in love with an American naval officer, Paul, whose ship is anchored near that town. But Paul falls in love with Barbara, and she with him, to the despair and anger of her Spanish cousin, Alvarado. During the festivities held to celebrate Barbara's return from the convent school, Alvarado tries to carry her off; the horses are ready, but Natoma discovers the plot and stabs Alvarado. In the last act she goes to a nunnery.

Dramatically, this last act is an anti-climax; musically, it eloquently attests Victor Herbert's ability to write in the grand opera style. It begins with a sort of lullaby, sung by Natoma—one of the finest things of the kind in existence—a number which haunts the memory. Equally effective is Natoma's monologue, "Lonely Am I," in which she bewails her fate and that of her tribe, and invokes the Great Spirit to help her destroy the white invader. Her conversion, thru the exhortation of Father Peralta, followed by the singing, by choirs of monks and nuns, of genuine medieval strains, produces an atmosphere of religious exaltation of which any European opera composer might be proud.

Perhaps the weakest of the three acts is the first; in it there are some suggestions of the operetta style which Mr. Herbert created for himself in his lighter works: "The Idol's Eye," "The Wizard of the Nile," "Babes in Toyland," etc. Of great charm is Natoma's legend of the amulet, "Would You Ask Me of My People," which is likely to become a popular parlor number. Love songs, choruses of sailors and convent girls give variety to the score. In the second act every one is enchanted by the diverse dances, including a minuet, a pañuelo, and especially a genuine Indian dagger dance, which Mr. Redding found in his researches among the tribes, and which Mr. Herbert has doubtless harmonized in the way the Indians themselves would have done it, had they known harmony or used orchestras like ours. This dagger dance, as done by Mary Garden, is the sensational feature of the opera, the feature which will help to keep it afloat until the public has become familiarized with its beauties as a whole and demands it for their sake also. "Natoma" deserves to live; it is much better, musically, than Puccini's last work, "The Girl of the Golden West."

"Suzanne's Secret"

A few years ago the Oratorio Society produced a setting of Dante's "La Vita Nuova," by a young composer named Wolf-Ferrari, half Italian, half German, as the name indicates. It was favorably received, but nothing more was heard of him until Andreas Dippel and his Philadelphia-Chicago Opera Company produced his one-act opera, "Suzanne's Secret," as a curtain raiser for Massenet's "Jongleur de Notre Dame," at the Metropolitan Opera House. Its success was such that Mr. Dippel at once cabled for the rights to produce one of Wolf-Ferrari's longer operas next season.

Wolf-Ferrari has been living for some years in Venice, "wholly unknown," as a biographer has remarked, "to musical Italy today, with whose leading spirits he has not a breath in common." It would indeed be impossible to think of anything more different from Mascagni's "Cavalleria Rusticana," Leoncavallo's "I Pagliacci" and Puccini's "Tosca" than "Suzanne's Secret." Instead of blood and thunder in general, we have in this opera simply a domestic tempest in a teapot, due to the fact that a husband suspects his wife of receiving the visits of a rival, because he smells smoke. In the end he discovers that it is the wife herself who indulges in cigarettes, to quiet her nerves and while away time while he is at the club. So he lights a cigarette himself and all is forgiven.

As light as this plot is the music. In its essential traits it recalls Rossini, Mozart and the still older Italian writers of opera buffa; yet in coloring and harmonization it is quite modern. This makes a pleasing mixture, which the audience thoroly enjoyed. Even the critics were pleased, strange to say.

"SNOW-CLAD HUDSON."
From the painting by George Bellows.

At the Academy and Elsewhere

With the question of the site for its future home still undecided, the Academy once more invites us to view the showing it can make under present conditions. Mr. Alexander, its president, has, since giving up the Bryant Park site, put forth the project of having the city condemn the two blocks opposite the Public Library on Fifth avenue, so that they may be acquired by the Academy for a building. A suggestion has also been made that the Lenox Library building be donated to the Academy by Mr. Frick, and altered for its purposes. The first idea would, of course, give a chance for an architectural work on the scale of the library itself, but there is little likelihood that the city can be induced to accede to such a request from this body of artists, who somehow never seem able to make themselves beloved by the city. Of course, there should be a great palace of art in New York, and if the Academy can bring it into existence, might there not develop a generation of artists greater than those of the present?

At the present exhibition the most thoroly satisfactory picture in being what it sets out to be is C. W. Hawthorne's "The Trousseau." A suggestion that hangs about it of danger in the future of this painter of declining to the sweetness so disastrous to genre painters, is all that can be said in adverse criticism. Lovely in color, sensitively felt in the sentiment attached to the young face with its lifted eyes, whose look hangs in space, and very skilful it is in its arrangement of tones and masses. No one can fail this time to agree with the jury of selection who gave the $300 Thomas B. Clarke prize for the best figure composition to Mr. Hawthorne, nor with the authorities of the Metropolitan Museum who have bought the picture out of the Hearn fund for the permanent collection. The Saltus medal for merit was given to Mr. John C. Johansen for his large and ambitious canvas called "In a Garden," with its many cleverly painted figures in sunlight and shadow easily yet skilfuly grouped and characterized. His wife, who was Miss Jean McLean, shows a single figure in a golden light as vig-

orous as the many good things in her recent exhibition in the Folsom Galleries. The three Hallgarten prizes of $300, $200 and $100 go this year respectively to Lillian Genth, for her "Depths of the Woods," a decorative combination of nudes and landscape, with a jewel-like color recalling Diaz through a modern envelopment of light; to Joseph Pearson for a faithful presentment of a group of geese — genuine portraits — excellently composed, and to Leslie P. Thompson for an interior; "Tea," neither very good nor very bad. The Julia Shaw memorial of $300 for the best painting by a woman is awarded unwisely to Mary Van der Veer for "The Geography Lesson," which has a rather decadent harmony of colors, but some unforgivable faults, such as a hand like a rake on the window sill. The Inness gold medal for the best landscape goes by turn rather than by merit. this time to Elmer Schofield. The best landscape is really that by George Bellows, the "Snow-clad Hudson," hung in the small Academy room. Here the dazzling quality of sunlight on snow, and unusual choice of lines and a pleasant spotting of figures to make the repeated horizontals possible, make this picture of Riverside Drive and the Hudson a canvas for ownership of which the Savannah Museum of Art is to be congratulated. Mr. Bellows has another landscape in the South Gallery that is almost as bad as this one is good It is called "New York," and shows a conglomeration of buildings looking like various shapes in unwholesome candy. With his method, if he fails to hit a thing exactly, the result is atrocious. An Arizona landscape, "The Golden Cloud," by A. L. Groll, in the Center Gallery, is a good example of this artist's rather dramatically beautiful handling and selection. Ernest Lawson who has too early developed a mannerism of color that shows a limited outlook, is represented by two canvases. L. J. Waugh has two strong marines, and there are the usual

A PRIZE PAINTING BY JOHN C. JOHANSEN.
The painting, "In a Garden," from a photograph of which we reproduce this illustration, received at the spring exhibition of the National Academy the Saltus Medal.

number of faithful impressions of all parts of America and traveled lands by uninspired but good craftsmen. Good portraits are very scarce. Mrs. Kenyon Cox's large canvas of her three serious looking children is sincere, and in some ways the best thing she has done, tho awkward in the design. A. L. Kroll's portrait of Dr. Barney is fair. Sergeant Kendall is becoming too academic. Helen M. Turner has a "Belle Creole" that is so good as to show great strides in her work and promise much. Frank Fowler, whose memorial exhibition at the Century Club took place recently, is represented by a good head of G. McAdoo. There are two portraits of John Burroughs, the naturalist, neither of which are works of art. A little girl named Bettie Holter is most lovingly painted by George de Forest Brush. Among the sculptures, which are few, a little statuette called "Pippa Passes," by L. Gardin, is an individual bit. The medallist Brenner has three nudes, all of which show over-elaboration of detail in the faces and lack of harmony between figures and bases, but good modeling. Miss Eberle scores again with "The Little Mother." W. Mazur, a new comer, shows a very low relief plaque, "The First Plaited Hair," that is unusually delicate and simple. We must expect the "Independents," who are to show next month, to give us something more exciting than the Fifty-seventh street exhibition. In the meantime, and by way of contrast with the Independents, we have "The Ten."

There is a choiceness, of course, in the little exhibition at Montross's which no larger group, however able, could be ex-

pected to attain. Not all the pictures are masterpieces, but none are mediocre. Again Alden Weir and Dewing prove themselves the most original masters in the group. Chase gives no sign of weakening; in fact, the portrait here is one of his best. De Camp has a fine portrait and a charming study of whites against the light. Hassam's "Breakfast Room in New York" is very beautiful, tho his street scene, "Nocturne," is not so unusually beautiful as Weir's. Tarbell's portraits and Metcalf's landscapes are typical, but not extraordinary for them. Benson and Reid are the only two who never seem to deepen in interest with the years.

New Plays and the New Theater

When all is said the season which is drawing to a close has not been brilliant in the theater. It would be easy to talk about some of the revivalists—Miss Barrymore, for instance, who is better in Barrie's delicious "Alice Sit-by-the-Fire" than she was a half dozen years ago, and who offers as a novelty the one-act play by the same whimsically satiric author, "The Twelve-Pound Look." But "The Twelve-Pound Look" is too slight a piece to call for serious analysis. Also, it is unnecessarily attenuated. The main point is that the little play is one more thrust at the smugness of mankind—married mankind. Mr. Barrie is keen at this pastime. And Miss Barrymore is the charming typist who is an alderman's ex-wife and happy to be "ex."

Of the new plays weightier than "The Twelve-Pound Look"—we do not say that they are better weight—only two or three need detain us. "Everywoman," by Walter Browne, is called by its producer, Henry W. Savage, "a modern morality play." Whether it is or not depends on the sense—not the sense of the word, but the sense used in the theater. If you shut your eyes and listen you would call it a morality play, because in language and the quality of its verse it resembles a play of the time of "Everyman." But if you stop up your ears and open your eyes you would take it for a modern comic opera. If you keep both eyes and ears open—but we will not venture to say what the effect would be upon the reader nor what it was upon us. The lesson is, as beseems a morality play, simple and obvious. Everywoman, when she sets out upon her pilgrimage in search of Love, has three charming companions, Modesty, Beauty, and Youth. What more can Everywoman want? But when she goes upon the stage and listens to the suit of Passion and is feted by Wealth, she first loses Modesty, and then Beauty dies, and finally Youth deserts her when Time, the call-boy, comes to her door. Returning to her own fireside she finds King Love the First still waiting for her—a more happy ending than is usual in real life. The play is lavishly and beautifully staged, and two of the characters are out of the ordinary: Nobody, who acts as the interpreter, and Conscience, a sweet-faced companion, who stays close by Everywoman thruout.

Augustus Thomas's new play was originally to have been named "The Jew," but on second thoughts the author called it "As a Man Thinks." His play is undeniably interesting. We have opposed, first of all, a good Jew and an evil Jew; next, two love intrigues, the one leading up to, the other all but leading out of wedlock. We have in too vague conflict mother's love and passion. We have the exposition of problems of mixed marriages (speaking of religions and bloods), and of the so called double standard of morality. These somewhat various matters and the incidents which illustrate them afford Mr. Thomas more than enough material for four acts. This becomes obvious to the theatergoer, for his product is woefully wanting in definition. The knots into which Mr. Thomas ties his action are cut by an apocryphal Fate — one Sentimentality, not mentioned in the mythologies. In both the love intrigues at which we have hinted, it is the evil representative of Israel who is the trouble maker, playing, respectively, suitor and third party in the inevitable domestic triangle. For those who still go to the theater to see a character instead of a play there is compensation for every shortcoming in the noble character of the Jewish physician, Dr. Selig, whose daughter is engaged, against her will, to the rascally Jew just referred to, but ends by elop-

ing with a pagan lover of Christian birth, just as Jessica did before her. John Mason, well trained in the school of "stock," proved, as ever, an exemplar of artistic reserve and distinction. With the part of Selig, sympathetic tho it is, taken by an actor less dignified, less manly, or less sure of his art, the play might easily have fallen flat. Mr. Thomas has imagined a great drama, but has not written it. Possibly this is because he feared to follow out to the logical conclusion any one of the social, racial and moral problems or conflicts involved. He has succeeded, however, in writing a play of more than common interest, interpreted by a company decidedly more competent than New York is wont to see, the cast including the ingratiating Vincent Serrano, Walter Hale, John Flood and Miss Chrystal Herne.

The most interesting news of the New Theater is the announcement that the present building, which has been admittedly too large to favor the original purposes of the enterprise, will be abandoned at the close of this season. The building on Central Park West has been leased for the coming year to George C. Tyler, a New York manager, who plans to open his season in producing a dramatization of "The Garden of Allah." Later in the year Mr. Tyler will entertain there Madame Simone, formerly the wife of M. Le Bargy, of the Comédie Française, whose New York season opens in October at a Broadway theater, but who, somewhat later, will take part in an English version of Rostand's "Princesse Lointaine."

Let it not be thought, however, that the New Theater enterprise itself will be abandoned, once the great auditorium is turned over to Mr. Tyler. The founders have arranged for the construction of a much smaller house on a site adjoining the Hotel Astor, between Forty-fourth and Forty-fifth streets. In a house whose proportions will favor the presentation of social comedy and plays dependent upon something more personal than stage effects, we look for a much more interesting series of performances than the New Theater has already given us; and we pride ourselves that, from the beginning up to the present moment, THE INDEPENDENT has seen the merit of the performances so conscientiously, if not always brilliantly, produced under Mr. Ames's direction.

Since our last review of the drama, the New Theater has produced "The Arrow Maker," a play by an American author, Mrs. Mary Austin. Here all the characters are American Indians. The scene is laid in the foothills of the Californian Sierras before the advent of the white man. The text is written with noteworthy fidelity to Indian character, ethnology and archeology. We doubt if any play recently produced in New York has surpassed it in scenic effects. The Indian music, war dances and bridal dances were especially well done. The plot of the play, however, which centers about the love of an Indian priestess for "The Arrow Maker" scarcely carries conviction to a pale face audience. The Indians are only too obviously white men and women in disguise. If the play does not make a wide appeal it will be on this account only, for in acting and accessories it fascinates the discriminating.

NEW YORK CITY.

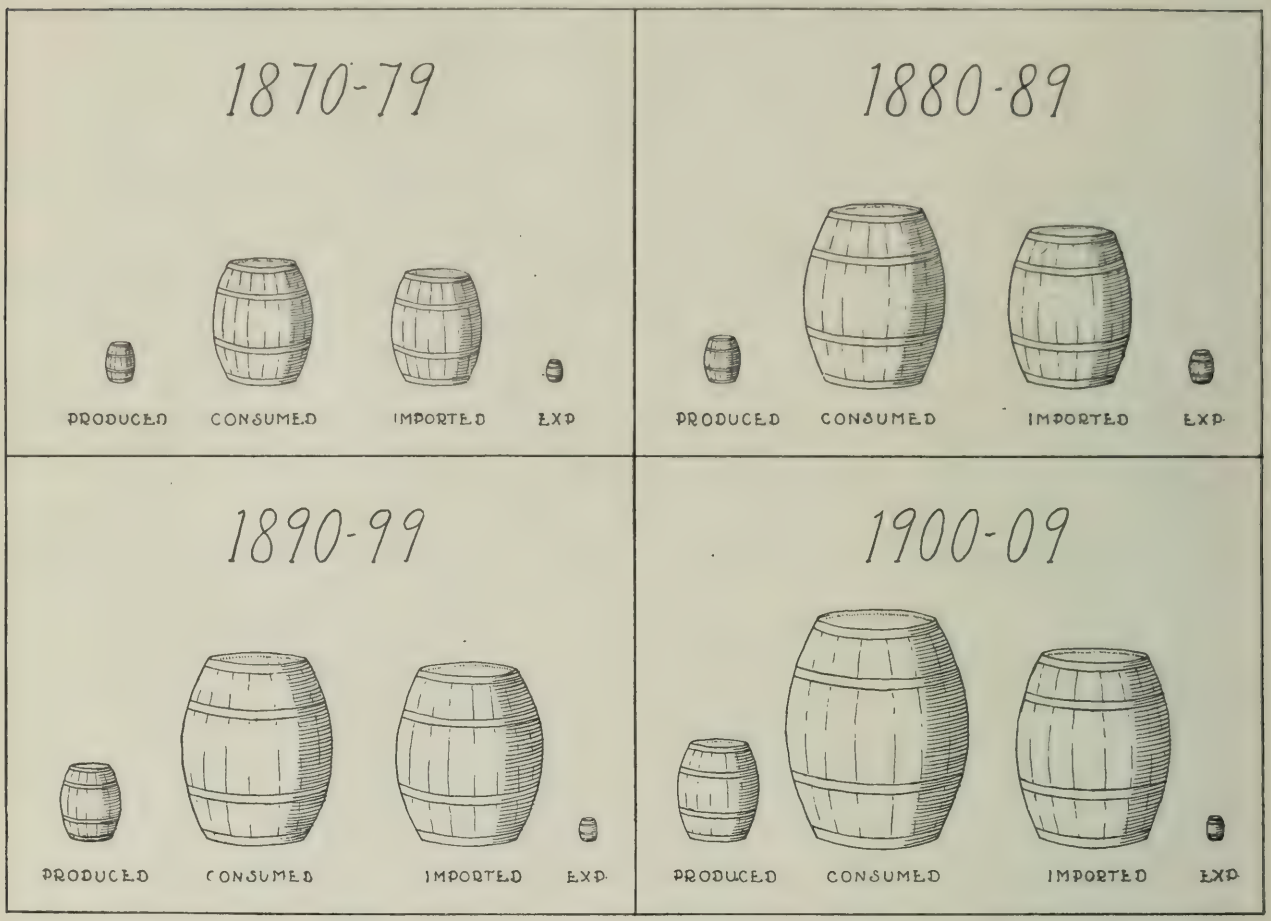
Rich and Poor

BY MARGARET ROOT GARVIN

I WAS rich when I was born,
I'll be rich again when I die;
So there still is cheer in this famine-year,
So long in the passing by!

So long in the passing by—
So foreign-faced, and lone:
Where not one I meet, in the door or street,
Is ever one of my own!

I was born to the wealth of a home,
To the heart-hoards Love doth spend;
I shall yet lay hold of that buried gold,
At the tear-tint rainbow's end!



I am miser of memories now
(The gold with a grief alloy),
But some Heaven-day shall my want repay
With the spendthrift hand of Joy!

WHITESBORO, N. Y.

Our Sugar Crop

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

THE domestic production of wheat meets the needs of this country with a constantly decreasing proportion for export. The domestic production of cotton is so great that it supplies the home demand and enables us to export about twice as much again. When we turn to sugar we are confronted with different conditions. The (1) production, (2) consumption, and (3) imports per annum in millions of pounds have been as follows since 1870:

	(1)	(2)	(3)
1870-79	165	1,677	1,651
1880-89	271	3,446	2,463
1890-99	592	4,267	3,715
1900-09	1,213	6.060	4,883

Over one-third of the imports come from Porto Rico, Hawaii and the Philippines. The quantity of cane sugar imported from Hawaii now exceeds our own production of cane sugar. Exports reached a maximum in 1885, and are at present less than 2 per cent. of imports. At present the production of cane and beet sugar in this country is about equal. In 1909, out of a total production of cane sugar amounting to 829,000,000 pounds, over 795,000,000 pounds came out of Louisiana alone. The only other State with a considerable production of cane sugar is Texas. The production of cane sugar in Louisiana in 1861-62 was over 500,000,000 pounds. In 1864-65 it fell to less than 11,000,000 pounds, and not till 1893-94 did production again equal the figures for the years before the war.

The domestic production of beet sugar first reached 10,000,000 pounds in 1892, and when we consider that from 1907 to 1909 it averaged over 900,000,000 pounds per annum, some idea of the rapidity and magnitude of this increase can be gained. Nearly one-third of the beet sugar comes from Colorado, while Colorado, California and Michigan together furnish about three-fourths of the beet sugar produced in this country.

Our per capita consumption of sugar today is about 80 pounds, having doubled since 1870. In Great Britain alone is the per capita consumption of sugar greater than in the United States.

New Haven, Conn.

LITERATURE

The Making of Laws

PROFESSOR STIMSON writes learnedly, but carelessly and often injudiciously, of the making of laws from Anglo-Saxon times to the present.[1] Vast research is evident in his work. He delves alike into the oldest and the most recent laws, and patiently traces principles and tendencies. But he writes with a jaunty self-confidence which betrays him into frequent error and contradiction. He has, moreover, two pet prejudices—trade unionism and Socialism; and he loses few opportunities—indeed, he may be said to make opportunities—for bringing them in for sarcasm or censure. His exposition, moreover, is often confused, sometimes from defective construction and sometimes from partial or complete contradiction of statement.

The first two chapters may prove to the average reader somewhat puzzling. The fact that the older legislation took the form of declaring what the laws were rather than of making new laws is rendered, by frequent repetition, fairly clear. Nevertheless, many of the statements are more or less conflicting. "The English Parliament," he writes (p. 4), "as you doubtless know, was the successor, or grew out of, the old Witenagemot, the old Saxon Great Council." The English Parliament, by the way, dates from 1264-5. Yet we are told on page 3 that "legislatures themselves are fairly recent; that is, they date only from the end of the Dark Ages, at least in Anglo-Saxon countries." There is no harmonizing these two statements. Nor is it possible to harmonize either with another statement (also on p. 3) that "a thousand years ago they [the people] never said that a legislature *made* laws." A thousand years would take us back to A. D. 910, a time according to the author long before there were any legislatures. On page 11 the statement is made that "it took more than one century for the Parliament, after the Norman Conquest, to revive as a Parliament at all." It actually took within two years of two centuries. On the same page it is said that two or three more centuries were required before Parliament "established the principle that it had anything to do with the making of law," while on page 15 it is said that "Parliament began avowedly to make laws in the thirteenth century." It is further confusing, moreover, after being told on page 17 that Edward the Confessor was called "the English Justinian," to be told on page 46 and again on page 54 that that appellation belongs to Edward I. A dozen more statements, equally conflicting, may be pointed out in the first sixty pages.

Of more direct and unequivocal errors there is also a goodly number. On page 66 we are informed that Thorold Rogers "tells us that these [about 1364], after all, were the happy days of the laborer." As a matter of fact, Rogers placed his "golden age" in the fifteenth and first quarter of the sixteenth centuries, with a particular emphasis on the last quarter of the fifteenth, or, say, more than a hundred years after the less favorable period given by the author. On page 74 Jack Cade's rebellion is dated 1452; on page 79, 1450, and on page 284, 1452 again. Cade was killed July 12, 1450. Mary Wollstonecraft (not with one "l," as the author spells it) is said (p. 336) to have published her famous book "about 1812." The 'Vindication of the Rights of Woman" was published twenty years earlier, in 1792. The curious statement is also made that it contains not a single word about votes by women, or the right to the ballot. Miss Wollstonecraft proposed, in fact, a further step than the suffrage, and that was parliamentary representation for women (p. 154, Humboldt Library edi-

[1] POPULAR LAW-MAKING. A Study of the Origin, History and Present Tendencies of Law-Making by Statute. *By Frederic Jesup Stimson.* New York: Charles Scribner's Sons. $2.50.

tion). On page 104 the statement is made that England liked their (*sic*) wines dry (sack)." If this means that the word "sack" was equivalent to the term "dry wine," it is probably an error. Richard Grant White and others long ago showed that "sack," in Shakespeare's time, meant nothing more nor less than sherry. Just who is meant by the expression (p. 276), "Mayor Ruef of San Francisco," can only be guessed. The Hon. Abe Ruef was never mayor of that city. It is interesting information (p. 25) that "extreme Socialists say that all private property is robbery." This is not a doctrine of any kind of Socialism. The guilds are said to be (p. 19) "the historical predecessors of the modern trades unions." If this means that the latter have grown out of the former, it is an error. Sidney Webb has sufficiently covered the matter. Finally, one would naturally expect a Cambridge man to remember his dates of revolutionary history. It is, therefore, with some surprise that one notes (p. 276) the evacuation of Boston put at "ten or twelve years later" than the Boston Massacre. It was just six years later. One can carry this citation of blunders to much greater lengths.

Professor Stimson argues that there are too many statutes, and that many, if not most, of current disputes and maladjustments could be settled by application of the common law. It is not an argument that will bear close analysis. The growing complexities of the social organization and the progress of inventions and processes continually bring forth problems that can be dealt with only by specific statutes. It is curious to find a writer dealing with law from an evolutionary standpoint who does not see in the enormous increase of statutes a normal consequence of the increasing complexity of life. W. J. GHENT.

Mary Wollstonecraft: A Study in Economics and Romance. By G. R. Stirling Taylor. New York: John Lane Company. $2.50.

Mr. Taylor's account of Mary Wollstonecraft's personality and career is interesting for the sufficient reason that the career and personality are interesting. A lack of literary vigor prevents the biography from attaining anything like distinction, however, and its chapters do not measure up to the portraits in photogravure from the paintings of the lady by John Opie and of Godwin by Northcote. In discussing his unconventional heroine, Mr. Taylor reminds us of those minor novelists who carefully explain what qualities and features their characters have without succeeding in really limning those characters. The same thing is true of his discussion of Mary Wollstonecraft's books. In alluding to the pamphlet "Thoughts on the Education of Daughters," in commenting on the sentences, "The first thing to attend to is to lay the foundation of a good constitution," and "It may be observed that I recommend the mind being put into a proper train and then left to itself," Mr. Taylor would have us recognize these sentiments as not commonplace in 1787, when the book appeared. The fact is, however, that Rousseau (whose name appears not in the index, altho it does occur once in the text) had already given impetus to a great deal of this sort of writing. In fact, the entire eighteenth century was preoccupied with problems of education. There were published just before the breaking of that century Fénelon's "Education des filles" and his more famous "Télémaque"; Rollin in France and Locke in England wrote their treatises early in the century; Madame de Lambert's works belong to the fourth decade. As for Rousseau, there was no necessity of waiting for his "Emile" to sample his educational theories. The third letter of the fifth part of the "Nouvelle Héloïse," which treats of Julie's children, is, as it were, a first draft of the first volume of "Emile." Not altogether to lose sight of the present biography, one may add that it makes interesting reading today in spite of shortcomings: partly because its subject anticipated the most advanced of present day suffragets. It is only a few weeks since the first woman to sit in a European parliament spoke from the tribune of the Norwegian Storthing; but in the eighties and nineties of the eighteenth century the liberated female who was to become Godwin's wife and who died in giving birth to Shelley's Mary was insisting upon the right of

English womanhood not only to justice, but to the suffrage, too. So slow is progress!

Day in Court. By Francis L. Wellman. The Macmillan Co. $2.

The prejudice against "talking shop" probably arose among listeners of the same craft as the speaker, for to outsiders shop talk is the most interesting of all talk. This book is "shop talk" of the law, written by an old hand, an accomplished trial lawyer, in an alluring and yet authoritative manner. It gives "some practical knowledge of the arts of the great advocates in eliciting the truth; the methods by which they charm and convince both court and jury." Incidentally, it reveals imperfections in the methods of American courts, as by quoting Rufus Choate's saying that "Jurors are like twelve human dice which must all turn up one way or there is no verdict." What stronger argument against requiring a unanimous decision! Inevitably the whole work accepts the professional assumption that the lawyers are the most important factors in the trial of cases, Truth and Justice being their obedient handmaidens, to be summoned into court only at their call. This assumption, continued thru decades, has resulted in that glorification of technicalities, that subordination of essentials to forms, which mar our court procedure. If all judges, like Mayor Gaynor of New York, when he was on the bench, would insist, with vehemence and doggedness if necessary, that the lawyers are permitted to be present only to assist the court and to expedite the administration of justice, not to show off their legal lore nor to erect obstacles even in their client's interest, "the law's delay" might cease to be one of life's evils and litigation become a road to justice.

What is Art? Studies in the Technique and Criticism of Painting. By John C. Van Dyke. New York: Charles Scribner's Sons. $1.

Professor Van Dyke's new book is not, as its title might imply, a treatise on esthetics, but a group of half a dozen essays put forth as argument "not only for art as art, but for art as an expression of life; that and its decorative and utilitarian aim are its sole appeals; they never should have been lost sight of for a moment; in the appreciation of art the commercial phase of it is irrelevant and wholly negligible." In bulk it is only a little book that can be carried in the coat pocket, but none more suggestive and stimulating on its theme has appeared in several seasons. We in America, Mr. Van Dyke holds, have become so interested in art as a commodity, or a curiosity, that we are in danger of forgetting that art may be regarded purely as art, or even as something of use and purpose. We have taken our notions of art too much from dealers, collectors and museum directors, and have thus been led into historic and commercial fallacy. We are "in danger of forgetting that name and price and pedigree have nothing whatever to do with excellence or its absence in a work of art. The canvas that will not stand without a signature, a hall mark, or a dollar mark cannot stand long by virtue of them." The devotees of only the rare and the dear he castigates as enemies of sane art appreciation. But the modern artist himself is not blameless in this matter, for by a too strict adherence to the model he has allowed his powers of visual memory and invention to become atrophied—has "caught at the form and missed the spirit." One of the best chapters in the book is that on "The Use of the Model," which is a relentless but salutary exposure of the extreme literalness that vitiates so much of contemporary art. He makes a strong plea for an intelligent patronage and appreciation of our own art, which he finds "neither despicable nor negligible, tho higher criticism seems disposed both to sneer at it and neglect it." He champions the much maligned skyscraper, in that it fulfils its purpose and is picturesque, is our only original style in architecture, and embodies a new principle in construction. He points out that

> "we shall not be great in art or its appreciation, nor shall we in any wise become an artistic people, until we put aside our foreign baubles and do our own things, with our own materials, in our own way . . . the inspiration of a nation's art never came out of the junk-shop."

The Lady of the Spur. By David Potter. Philadelphia: J. B. Lippincott Company. $1.50.

A tale of the West Jersey pine barrens, in the early days of the nineteenth century, is told with freshness and charm. An Old World atmosphere of romance hangs about Morvan Manor, which is claimed by three heirs, who are none of them over-scrupulous in their methods of attempt to supplant each other. It is difficult to realize that New Jersey was infested with highwaymen less than one hundred years ago, that gentlemen rode armed and had often occasion to use their ready pistols on dark nights. *The Lady of the Spur* flashes thru the tale, straight and slender and high-spirited, like a proper heroine of such stirring adventures. It is easy reading, and diverting enough to repay the investment of an idle hour or so in following the fortunes of Tom Bell, convicted highwayman and gallant gentleman.

Literary Notes

....The problem of the Kongo, long the theme of sermons, political appeals and diplomatic negotiations, is now treated in fiction by Paul Trent in *The Vow* (Stokes; $1.25).

....Those interested in organizing and conducting religious deliberative bodies will find a helpful guide in Dr. W. E. Barton's *Rules of Order for Religious Assemblies* (Revell; 50 cents).

....Andy Adams contributes an entertaining and fairly veracious narrative of American boys and ranch life in *Wells Brothers: The Young Cattle Kings,* a story for boys (Houghton, Mifflin Co.; $1.20).

....The Macmillan Co. announces a new novel, *Adventure,* from the nervous pen of Jack London—who was at last accounts a prisoner in a Mexican jail. Here is a novelist who does not confine himself to writing romance, but lives it.

....The Second Théâtre Français has offered its public in the play entitled "Maud" merely a French adaptation of Bret Harte's "Luck of Roaring Camp," altho the author, Pierre Lecomte du Novy, makes no acknowledgment of the source of his play.

....Essays are suggested by the title, *Literary Lapses,* but Mr. Stephen Leacock offers us instead a volume of sketches and short stories. The form of these is excellent; many of the little tales are most diverting in themselves. (Lane; $1.25.)

....*The Anti-Saloon Year Book* for 1911, edited by E. H. Cherrington, contains excellent ammunition for the campaign and an encouraging report of the progress of temperance. (Westerville, O.: Anti-Saloon League; 35 cents, paper; 60 cents, cloth.)

....Nancy K. Foster is doubly fortunate in the timeliness of her story, *Not of Her Race* (Badger; $1.50). Esteban is the virtuous Mexican hero, Ruth the heroine, and Woodbridge the churlish American husband-villain, of a somewhat amateurish romance.

....Those who want to know which are the best books on child study, cookery, house furnishing, textiles, etc., would do well to invest 15 cents in the *Annotated List of Books Relating to the Household Arts* prepared and published by Teachers College, Columbia University, N. Y.

....The author of "The City of Beautiful Nonsense" offers in *The Patchwork Papers* a collection of little sketches and essays distinguished by a delicate touch and whimsical spirit, and all or almost all with London for scene. (*The Patchwork Papers,* by E. Temple Thurston; Dodd, Mead; $1.20.)

....J. Smeaton Chase is the author of a little book on *Cone-bearing Trees of the California Mountains* (Chicago: McClurg; 75 cents). The writer knows his subject and is charitable enough to use comprehensible terms in identifying his trees. The work is to be recommended as a brief and convenient field-book.

....Dr. Philip L. Jones's *Script and Print* is a slim volume to serve as "A Practical Primer for Use in the Preparation of Manuscript and Print." (Philadelphia: Griffith & Rowland Press, 25 cents). If we take into account its brevity (pp. 54) it is certainly packed with information, and it is entertaining into the bargain.

....In an age when we hear so much of juvenile delinquents a volume entitled *Young Gaol-Birds,* for which no literary merits are claimed, but only that "the incidents described are absolutely true to fact," is bound to find its public (Macmillan; $1.10). Charles E. B. Russell, the author, is a social worker of Manchester, England.

....M. Honoré Champion, under the general title, "Bibliothèque de la Révolution et l'Empire," will publish a series of volumes of private letters, diaries, etc., written by and about celebrities of the epochs indicated. The general editor of this series is Professor Arthur Chuquet and the first volume will be entitled "Lettres de 1815."

....From the Government Printing Office comes a publication of the Department of Commerce and Labor, Bureau of the Census, bringing together *Statistics of Cities having*

a Population of over 30,000 in the year 1908. Tables show in detail the financial transactions of the municipalities, their indebtedness and assets, and the assessed valuation of taxed property.

....Horace Traubel's latest volume of verse is published by B. W. Huebsch ($1.50) under the title, *Optimos.* At the rate of a page a day, the book would last one over a year. Perhaps it is unnecessary to add that it takes Mr. Traubel a good while to convey his frequent messages. A leaflet enclosed in the volume informs the reader that the latter "may truly be called a Book of Joy."

....Thru the generosity of the trustees of the Elizabeth McCormick Memorial Fund the United Charities of Chicago is enabled to issue its publication, *Open Air Crusaders,* a report of the Elizabeth McCormick Open Air School, with a general account of Open Air School Work in Chicago, and a chapter on School Ventilation, free of charge. The volume is edited by the General Superintendent of the United Charities, Sherman C. Kingsley.

....*The Dweller on the Threshold* in Robert Hichens's latest novel is not the same as in Bulwer-Lytton's "Zanoni" but a creature less tangible tho no less terrible. The moral of the books is that clergymen should beware how they exchange personalities with their curates. Not many clergymen, so far as we know, are in the habit of doing this, but it may be well to have them warned against it. Mr. Hichens introduces the supernatural element with his usual skill. (Century Co.; $1.20.)

....In his book somewhat incorrectly styled *The Evolution of Religion* (Sherman, French & Co.; 80 cents) William A. Hinckle, M. D., presents many sensible arguments, drawn from history and logic, for the rejection of some of the popular conceptions of "orthodox" Christianity. He seeks most prominently to show "the lack of evidence as to the superhuman origin and character of our Bible, our religion, and of the great teacher, Jesus." The real "evolution" of these and other beliefs receives scant attention in this volume.

....A good deal happens in the novel called *The Wastrel* which is so improbable that the right kind of reader doesn't seriously weigh probabilities in judging it. Unfortunately there are evidences of hasty composition. Arthur D. H. Smith, who is the author, speaks of "potential possibilities," and when his manly hero is sixteen, refers to him as a "little boy." Were one to go farther than merely to suggest something of this novel's lively blending of Rhode Island smuggling, Cuban filibustering, and adventure in southeastern Europe, it might be worth our while to pick out graver inconsistencies. But Mr. Smith is entertaining, all the same. (Duffield; $1.30.)

....Rev J. H. Jowett, of Birmingham, England, is sometimes spoken of as the greatest living preacher of the English speaking peoples. However this may be, his sermons and addresses are exceptional in present day sermonic literature. His intellectual grasp, his stylistic power, and the deep emotion with which his sermons are suffused are always brought into service in handling topics of abiding interest and live problems that confront the religious life. Many will find comfort and courage in reading his *School of Calvary* (Pilgrim Press; 50 cents), and inspiration comes from every page of his volume of sermons, *The Transfigured Church* (Revell; $1.25).

....Simeon Strunsky's book, *The Patient Observer and His Friends* (Dodd, Mead; $1.20), serves a useful purpose in reminding us how high is the level of American journalism when the newspaper proprietor is willing. For most of the papers which make it up originally appeared in a New York evening paper, and they are, variously, humorous and keen reflections upon the things of today: both the big and the little. Mr. Strunsky passes in review ultra-modern clergymen, physicians, the press, collectors, children, musicians and automobilists, etc., etc., and is, we consider, at his best in satirizing the clergymen and in singing the praises of Brooklyn.

....Some months ago we commented upon the "Dickens stamps" movement, fathered by the London *Strand.* The latest appeal for a memorial to one of England's novelists is the shilling fund opened in the cause of preserving Winchester Cathedral, under the title of "Jane Austen Tribute." Nearly one hundred years ago Jane Austen was buried in the nave of the cathedral, and her admirers are invited to contribute just a pebble—no more—that the cairn raised in her honor may be not only a tribute to Jane Austen's genius, but the dead Jane Austin's tribute to the minster she loved." Dead authors are getting to be famous beggars nowadays!

....Charles Morrice is the author of a novel bearing the title *He is Risen,* that has made its appearance on the Paris bookstalls. The hero of the novel is represented as having suddenly reappeared on earth December 14, 1910, at Paris. There followed a miracle of a highly modern nature. The advertising columns of the newspapers, although regularly set up, electrotyped, and put upon the presses, come out blank, and there are blank spaces scattered throughout the news columns. It is remarked that in all the journals nothing but the truth has been printed since noon, December 14. Meanwhile, a small announcement has made its appearance in the white space on the last page of each journal—the page chiefly given up to advertising. This declares the presence of Jesus Christ in Paris.

At the Hôtel des Trois Rois, on the Place de l'Etoile, He daily receives the multitude, including representatives of the press. More miracles follow. Thus public order is restored, reconciliations are effected between ill mated spouses, and loveless marriages are prevented, brides and bridegrooms being inspired to say "No" in reply to certain questions asked at the altar. With the elimination of dishonesty, business has almost ceased. On Montmartre, the Master preaches to the entire population of Paris. The book *He is Risen* comes to its conclusion with the departure of Christ, on Christmas Day; at the request of the President of the Republic and the Prefect of Police. Thereupon the spirit of selfishness and the powers of corruption resume their sway.

....The New Church Board of Publication, N. Y., has just put into a neat little book the essay by Mr. James O. Fagan, published last year in the *Atlantic Monthly*, on *The Cheapening of Religion*. Mr. Fagan believes that the function of religion in supplying spiritual and moral inspiration is of supreme importance, but fears that it is being destroyed by a prevalent tendency on the part of religious leaders to descend too much to a platform of programs and devices. Perhaps his word of warning is a needed corrective to modern tendencies in some quarters, but we think he has hardly caught the meaning of the movement he deplores, in its best aspects.

....Luther's translation of the Bible has played a large role in the national, literary and religious life of Germany, and among multitudes who use the German tongue it has not been displaced by the later, more accurate versions. In the *History of the Lutheran Version of the Bible* (the F. J. Heer Printing Co., Columbus, Ohio) Rev. Dr. John P. Hentz has given a serviceable sketch of Luther's work and its relation to other versions, ancient and modern. Some inaccuracies occur, as, for example, in Dr. Hentz's statement about the first Bible printed in America (p. 148). Saur's or Sower's German Bible was the first *except* Eliot's Indian Bible, and it was printed, not in 1774, but in 1743.

....M. Henri de Régnier, the Symbolist poet and novelist, is one of the newest French Academicians. He was Jean Richepin's unsuccessful rival in one of the 1908 contests and yet he is now one of the youngest members of the Academy. The youngest of all is still M. Rostand, who is four years M. de Régnier's junior and had the distinction of being elected an Academician when he was only 34. Napoleon III's War Minister, M. Emile Ollivier, who is 85 and still actively writing, is the doyen of the Academy, but M. Mézières is 84, and M. de Freycinet, a former French Premier, 80. M. Thureau-Dangin, the historian, is 74; the Comte de Mun 70, and M. Jules Claretie, director of the Comédie Française, 71. Anatole France is 66, Pierre Loti five years younger, and Paul Bourget, 58. The French Academy bears a superficial resemblance to the United States Senate.

Pebbles

"EVERYTHING comes to him who waits," mused the man in a restaurant; "but it comes cold."—*Life.*

MR. CLEVERTON.—You saw some old ruins in England this summer I suppose.

Miss Struckett-Rich.—Yes, and one of them wanted to marry me.—*Princeton Tiger.*

VISITOR—We're getting up a raffle for a poor old man. Won't you buy a ticket, my dear?

Sweething—Mercy, no! What would I do with him if I won him?—*Judge.*

AN Optimist. He was falling from the twentieth story of a high building. As he passed the tenth story a man standing at the window heard him say, "Well, so far I am all right."

MR. BARNHART took us to the zoölogical park, where we saw all the animals and birds alive that we saw the previous day dead and stuffed in the Smithsonian Institution.—*Plymouth (Ind.) Democrat.*

THE kind old gentleman was watching the small boy struggle along under a large bundle of newspapers.

"Don't all of those papers make you tired?" he inquired.

"Naw, I don't read 'em," replied the lad.—*St. Paul Pioneer Press.*

AN Englishman at an animal store:

"Hi wants a kind of dog about so high and so long. Hit's a kind of gr'yound, an' yet hit ain't a gr'yound, because its tyle is shorter nor any of these 'ere gr'yound an' its nose is shorter an' 'e ain't so slim around the wyst. But still 'e's a kind of gr'yound. Do you keep such dogs?"

"We do not," said the clerk. 'We drowns 'em."

A STORY was told on Martin Lomasney at the Cape Cod commercial travelers' dinner by Representative Pope, of Leominster: "Last session Lomasney was seen talking to some one in one of the corridors, and as I passed I heard these words: 'Shall I write him?' 'No,' said Lomasney; 'never write a thing when you can talk, and never talk when you can nod the head.'"—*Boston Record.*

THE eight-year-old son of a Baltimore physician, together with a friend, was playing in his father's office during the absence of the doctor, when suddenly the first lad threw open a closet door and disclosed to the terrified gaze of his little friend an articulated skeleton. The doctor's son explained that his father was extremely proud of that skeleton.

"Is he?" asked the other. "Why?"

"I don't know," was the answer; "maybe it was his first patient."—*Harper's Magazine.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Tariff Plans for the Special Session

At the recent session of Congress, the Canadian Reciprocity bill was passed in the House by a vote of 221 to 92. The Democrats, only five excepted, were counted for it. Then they were a minority of the House; now they are a majority, outnumbering their Republican opponents by 66. Of course, they will pass the Reciprocity bill. But they have not yet decided whether the passage of this bill shall be their first act at the approaching special session, or whether they shall refrain from attaching to it, as additional sections, bills revising certain schedules of the tariff. There are some who urge that the passage of revision bills should precede action upon the agreement with Canada. There are some who would attach such bills to the Reciprocity bill.

At the beginning of the session, and without delay, the Reciprocity bill should be passed, and it should stand by itself. There are indications, we are glad to say, that a majority of the Democrats are in favor of this course. It is proposed that the bill shall empower the President to extend the scope of the agreement hereafter by executive action. We see no harm in that.

Mr. Taft would have Congress approve the agreement, pass the bill for a permanent tariff board or commission, and then adjourn. It is now thought that the bill for a permanent board will be rejected. Final action upon this bill was prevented at the end of the recent session by a filibustering movement, led by Mr. Fitzgerald, a member of so much influence that he has been selected for the chairmanship of the Committee on Appropriations. In this place he will be second, in the work of direction and management, only to Mr. Underwood, chairman of the Ways and Means Committee. The first report of the present Tariff Board is to be made, by the President's order, in December next. Those who would have no permanent board of this kind point to the long and unfortunate delay. We said some months ago that the situation called for a report before the end of the recent session, even if it should relate to only one duty in the tariff.

Altho their plans have not been completed, the Democrats of the House will attempt, at the special session, to revise parts of the tariff law. It is now expected that they will pass bills affecting the duties on wool, woolen goods and cotton goods. To these may be added bills placing on the free list agricultural machinery, binding twine (for grain), and the steel ties used on cotton bales. Such an enlargement of the free list would be designed to conciliate the agriculturists. The report to be made in December by the Tariff Board will relate to the cost of producing wool and woolen goods. Mr. Taft, it is understood, is convinced that the duties in the wool and woolens schedule ought to be reduced, but he would like to have Congress wait for the report. The House Democrats do not intend to wait. This is shown in a statement given to the press by Chairman Underwood, who says the new Ways and Means Committee has ascertained that, while the average duty on woolen goods is 90 per cent., the average labor cost in this country is only 25 per cent. As nearly as can be foreseen, the House surely will attack the duties on wool and those on manufactures of wool and cot-

ton. Probably it will also attempt to remove the duties now imposed on certain manufactured goods which farmers and planters must buy. But a general revision will be deferred until the regular session.

In the Senate the so-called Republican insurgents will probably hold the balance of power. The House will strive so to shape its revision program that it will gain their approval. But this will not be an easy task. These insurgents dislike the present duties on woolen and cotton goods, but their recent attitude indicates that they will probably defend the duty on wool. Moreover, they are protectionists, emphatically so with respect to the products in which their constituents are directly interested, which are largely products of the soil, altho they would consent to a considerable reduction of the duties on manufactures. They may insist that the Democratic program for the special session shall affect a longer list of manufactured goods than Mr. Underwood and his associates are willing to take up before December. And if they should agree with the House Democrats as to revision bills, and if these bills with their help should be passed in the Senate, it is by no means certain that the President would sign them.

The result of such an attempt at partial revision as the Democrats are now inclined to make cannot be foreseen. There may be long and fruitless discussion, to the disadvantage of business interests. If the Democrats are determined to attack parts of the tariff at this special session, they should confine their efforts to a small number of duties, the correction of which ought not to be opposed by a majority of the Senate or by the President. At the same time they might announce their purpose with respect to the entire tariff. We think they should vote for a permanent tariff board. It is needed now and will be needed in years to come. From it can be obtained that information which is required by revisers of tariff duties, whether the revision be made in accord with protectionist doctrines or in disagreement with them. An honest statement from expert investigators as to production costs here and abroad should be available for use in Congress. It should not be ignored, but should be welcomed, by those who think duties should be imposed only, or primarily, for revenue. If such information is given to them, they are not bound to make a revision in obedience to the Republican rule that the duty should equal the difference in production costs, plus a reasonable profit for the domestic manufacturer. But it will enable them to fix revenue duties with due regard for existing industrial and commercial conditions.

Ethics and Religion

UNDER the title "Is Christianity Ethics or Religion," Professor Patten asks and answers a serious question. Possibly some considerations not discussed by Professor Patten may add clearness to the argument.

Let it be first understood that ethics is the science of duty, of all duties whatever. It is not the science of beauty, nor that of pleasure, but solely and comprehensively of the obligations of duty. A man in society has duties to his family and to all his fellows. He may even have duties to himself, to his own body, and such duties are embraced under ethics. He may have duties to superior beings, to God, and such duties are all included under ethics. But all those duties which relate to God, or other superior beings supposed to exist, come under a section of ethics called religion.

By general consent of language religion means belief in such superior beings and duties resulting therefrom. The superior being may be a fetish, a ghost, or God—so wide is religion.

Now, duties come into existence and play just as soon as one comes into relation with other beings and has to consider some one else than himself. Were one to grow up apart from all human society it would be unethical for him to give unnecessary pain to a dog or a bird. If one grows up in a family or in a tribe, his relations will create duties, entirely apart from any belief in God or any existence of God. It is not God that creates these duties, but they grow out of the relations of society, just as truly as the theorems of geometry grow out of the relations of lines and angles.

So, as Professor Patten tells us, culture has much to do with ethics, because the sense of duty can be cultivated, just

as the sense of beauty, or the sense of pleasure. Culture teaches us to discover beauties and to enjoy pleasures never discovered by those lacking culture. But culture is not ethics any more than it is esthetics; it is a source of ethical culture, a field in which it can grow.

Professor Patten says that "culture does not need the Church." It is true that there can be culture without the Church—there was in the time of Pericles; there is in the Japan of today. It is true that ethics can grow without the Church—it did in the teaching of Platonism and Neo-Platonism. But that does not exclude the Church from adding its cultural power and even carrying ethics beyond what other forms of culture could attain. We are far from accepting the statement that "culture progress will go on as well without the Church as with it."

But Professor Patten is self-evidently right in saying that "personal goodness" is an element in ethics. We might say that it is the whole of ethics. He truly says that "social intercourse" is its prime factor. It is beyond question that moral relations and ethical duties originate and develop in social relations, whether in the family, the clan, or in the complex industrial relations of modern civilization which teach industry, honesty, frugality, temperance, punctuality and the like virtues. The inherent conscience teaches them, Church or no Church, God or no God; but the belief in God or the teachings of the Church can very much enforce and clarify and hasten all the ethical conclusions developed by social relations.

We hesitate to accept Professor Patten's distinction thus exprest:

> "The difference between ethics and religion is, that ethics has to do with social advance, while religion has for its problem social reconstruction."

Social reconstruction appears to us to be as much ethical as is social advance, and no more religious. Plato's "Republic" is a reconstruction of society, but it is not religious. Labor for social advance equally with that for social reconstruction will be religious if it is inspired by a regard for one's faith in God and one's loyalty to the universal Father; if not so inspired it is, in either field, whether advance or reconstruction, simply ethics.

Professor Patten has admirably stated some of the duties of religion, which are also duties of ethics: to succor the fallen, to raise the degenerate. There are other duties of religion, to be sure, to comfort, support and strengthen those who are not degenerate.

Instead of depravity as the field of religion, Professor Patten would speak of degeneration, and that degeneration he finds in the "admitted" fact that "the physical improvement of the race has ceased" and that "the elimination of the unfit has been thwarted by the action of human sympathy," so that "now, thru the many agencies for keeping the weak alive, the level of the race is lowered." On this point we are not convinced. If certain social conditions tend to lower the race level, other conditions tend to raise it, and human stature and strength were probably never greater than now. That kind of assumed degeneration we fear would be a fragile basis for a doctrine of religion.

Really what Professor Patten has done is to show that a special field for religion is in the lifting of the fallen and the removal of social evils. To be sure, this is also the sphere of ethics, obligatory on those whose agnosticism or atheism denies the claims of religion. Religion buttresses all ethics. "Thou shalt not kill" is ethical, but it becomes religious when pronounced from Sinai, and those will believe the voice of God who would not hear the mere call of conscience. For all sorts of duty religion is the strongest support; the Church upholds all good morals, and is the mightiest force for both social advance and social regeneration, because it relates itself to God's authority. Professor Patten recognizes this when, in the conclusion of his article, he finds fellowship with God to be the inspiring force of the Christian leader, and exprest in the ideal Christ has left for his followers.

A Chair of Good Breeding

An article in our first issue for this year on the University of London called attention to a unique department of University College, its Laboratory of Eugenics. This was founded in 1904 by Sir Francis Galton, who agreed to contribute to its support $2,500 a year for seven

years. On January 17 Sir Francis Galton died at the age of eighty-eight, and it was found that his residuary estate, amounting to about $225,000, had been left to the University of London for the maintenance of a Professorship of Eugenics, with a laboratory, library and office in connection with it. The provision for an "office" shows the practical character of Galton's ideals. In his will he specifies that it shall be the duty of the professor and his assistants, not only to collect materials bearing on eugenics and draw conclusions from them, but also "to provide instruction, under appropriate restrictions, to private individuals and to public authorities concerning the laws of inheritance in man, and to urge the conclusions as to social conduct which follow from such laws."

Thus Galton would facilitate the practical application of the ethical lessons derived from the law of evolution discovered by his cousin, Charles Darwin. Heredity, which seemed to the last generation a dreadful tyrant, is to become the servant of mankind. Galton realized from the first that the popular side of eugenics should be kept close to the research side, and that the public must be educated to a new and higher ideal of morality in marriage. He desired to make eugenics part of the religion of the future, so that people would come to regard the mating of the unfit with as much horror as they now look upon incest, and on the other hand to regard those who wilfully shirk the duties of proper parenthood as they look upon cowards and traitors.

Altho heredity is one of the youngest of the sciences, for it is only since the discovery of Mendel's law that its study could be successfully carried on, yet there has already accumulated a sufficient body of verified facts to enable an "office practice" to be established that would be of great benefit to humanity. Such recommendations as the infant science has to make at the present time would be chiefly negative. In cases where there is inheritable disease or where there is on both sides the same taint or defect the eugenist practitioner would be justified in giving the same advice as *Punch*—"Don't!" But the trouble with our civilization now is that *Punch* made his advice too general, and it is too generally followed by those to whom it least applies. Money, business connections, social standing, church affiliations, fine clothes and the like all have their say nowadays about who shall get married and who shall not, and it is time factors of more importance to the individual and to the race are also taken into consideration.

American scientists have more than kept up with English in the experimental study of heredity, thanks chiefly to the Carnegie Institution. But in the popularization of the results of these investigations more has been done in England, thanks chiefly to the Galton Laboratory. An endowment like that which Galton has given to the great University of London would be of great service in this country just now, for it is important that eugenics be introduced to the public as a moral and scientific ideal and not be perverted to license and quackery. The word "stirpiculture," which Galton at first used to express his ideal of good breeding, had to be dropped because it had been used by the Oneida Community, and the word "eugenics," which he devised to take its place, is in danger of the same fate. The only periodical in America devoted to eugenics is a free love paper *née "Lucifer."* But Galton was careful to state that his propaganda for the improvement of the human race should be carried on without interfering with existing laws, customs and sentiments relating to marriage.

Rats

Is it possible that we shall have in this country a serious epidemic like the Black Death, which swept over England in 1346, or the London Plague of 1665? Probably not; but sporadic cases near the seaports are not unlikely, and there have even been such cases recently in San Francisco, as there have been of late in Great Britain. A dozen years ago there appeared several hundred cases in Oporto and as many in Sydney. It would not be surprising if there should this next summer be a number of cases in this city or in Boston or Philadelphia or Baltimore or New Orleans or San Francisco. But there is no likelihood of

any such terrible epidemic as broke out in India from 1904 to 1907, which destroyed a million and a quarter persons each year. It has now extended to China, where the number of deaths is likely to be quite as great.

We are in far less danger from plague than are India and China, or than was Europe two centuries ago, because our sanitary conditions are far better. But this requires explanation of the source of plague infection.

The plague develops first in rats. The bacillus of the plague is carried by the rat flea to man. There are two kinds of rats, the domestic black rat and the more wild, non-domestic brown rat. In the time of the London Plague the domestic black rat was very common in England, and it is now very common in India and China, breeding in the roofs of the houses. Its fleas pass very easily from this rat to the human inhabitant. But this domestic rat is now infrequent in our present sanitary conditions, being shut out of houses, and finding an enemy in the larger and fiercer brown rat, which avoids human society and makes its home in sewers and drains, and about slaughter houses and grain bins. While it is a disagreeable and destructive pest it keeps out of men's way and there is no great danger of its fleas often passing to a human host. Nevertheless, this may happen, as it did happen in Glasgow and San Francisco, wherever infected rats can escape from ships to the wharfs, and where garbage may be found to feed them in uncleanly and congested districts.

Nevertheless, the danger is sufficient to make precautions necessary. Every house should be rat-proof. Any rat-holes should be stopped up with cement or broken glass. Rats should be killed. Apart from the danger of infection it is reckoned that rats destroy in England some millions of dollars a year. But individual enterprise will not destroy rats; that needs, and one of these days will have, the attention of the Government, as already to some extent wolves and mosquitoes are held to be public pests to be publicly banned. There is not an epidemic that is necessary. If we let people die in droves it is our fault. It is because we permit the filth conditions that introduce poisons into our systems, whether of the bubonic plague, the yellow fever, the cholera or typhoid.

The Mexican Question

THE first result of Minister Limantour's return to the Mexican capital has been the retirement of the entire Diaz Cabinet. This may fairly be ascribed to the exertion of his influence and to the arguments he addressed to the aged President. While he was striving to convince Diaz that this unpopular and partly superannuated Cabinet must go, it was necessary that he should retain the confidence of the powerful officer with whom he was arguing, and also of the many who regard that officer with respect and veneration. This probably explains those statements to the press from Señor Limantour which caused some disappointment and surprise. Altho he has been concerned for many years almost exclusively with questions of national finance, it is plain now that he is a diplomatist as well as a financier. His public utterances were carefully measured with regard to the situation and his purpose. If we assume that on the day before the resignations he felt that he was in danger of failing, we can understand why he spoke then so plainly of the gravity of the crisis, saying that the Administration had no definite plan, and pointing to the ominous opposition which had appeared and grown during his absence from Mexico. Those remarks to the public at home and abroad may have turned the scale. On the following day —at Diaz's command, of course—all the Cabinet Ministers resigned, and Diaz, with Limantour's help, set out to fill their places with men in whom the dissatisfied non-combatants would have confidence and to whom the Maderists could look for support of some, at least, of the reforms which they demand.

There was encouragement at once in the appointment of Ambassador de la Barra to the highest place. He is a scholarly gentleman, and a diplomatist and legislator of much experience. His recent notable contribution to THE INDEPENDENT, widely republished, has caused him to be regarded with favor by the revolutionist leaders. We are confident

that he will stand with Limantour in pressing those reforms which are required for a restoration of peace; and it is reasonable to expect that the other new members of the Cabinet will be in accord with them. Corral, whose election as Vice-President was forced by Diaz, and whose popularity is no greater than that of Creel, the arbitrary Governor of Chihuahua, will now, we are led to believe, give up his office. Señor de la Barra will then be directly in line for succession to the Presidency, where Señor Limantour might now be if he had not chosen partly to efface himself and to remain at the head of the Treasury Department.

These Cabinet changes are full of promise for Mexico. We shall not be surprised if the effect of them, and of the action which the new Ministers evidently intend to take, shall be a dying out of the insurrection within a short time. But the reforms should be announced without delay. Señor Limantour and his associates should not wait for the Maderists to lay down their arms.

Another semi-official explanation of the movement of our troops has been given to the public, and it does not appear to have been considered with care. Still, it is much more satisfactory than the first explanation, which was official and at the same time inadequate and more or less absurd. The time has come for an official explanation that shall really explain, one prepared by the President with the aid of his Cabinet. It is evident that the troops are not in San Antonio to enforce the neutrality laws along the boundary, and that no "solid military wall" has been erected on that line. The President should not be held strictly responsible for the dispatches of a news agency, even if it be understood that those dispatches were suggested by him. unless it can be shown that every statement and every word had his approval. The public cannot know whether the dispatches were prepared under such conditions. Nevertheless, he is criticised as he would be if the dispatches had been published over his signature, and he is held responsible for lack of uniformity or consistency or other defects. This we say with all due respect to the Associated Press, which certainly deserves to be commended for its reports, notably for those relating to Señor Limantour's mission. To some it seems that there must have been in the private reports to the President much which, probably for the best of reasons, he could not at first disclose. It may be that those reports were not well founded, or that he was misled. At all events, an authoritative and official statement, disclosing all that can properly be made public, would be timely now, and would put an end to sensational rumors which, in our judgment, have no foundation in fact.

The French Kaleidoscope

In July, 1909, M. Clemenceau made a tired gesture and committed political suicide. The greatest political duelist of his times, he had, standing outside ministries, brought them tumbling down with a volley of sarcasm; but he fell in his turn, tho chiefly thru his own weariness. Dependent for a majority, not only upon the votes of radicals of all shadings and degrees, but also upon the sufferance of the Socialists, who had at last earned Cabinet recognition, he succumbed to the complexity and ungratefulness of his task. In summing up the Clemenceau ministry, one finds it to have represented a diplomatic resistance to the demands of the Socialist party, whose program it delayed in granting it piecemeal. The Prime Minister himself was never a Socialist, for his part: he is too cynical a genius for that.

M. Briand, Minister of Instruction and Public Worship, then of Justice (he received this last portfolio that he might execute the Separation law, of which he had acted as "reporter"), succeeded M. Clemenceau. Many a "crisis" in France consists only in a number of grave gentlemen filing out of a room in a certain order, exchanging portfolios, and returning in a different order, with a different leader. M. Briand, before responsibility sobered him, was a persuaded Socialist. He went so far as to preach Hervéism—counseling the soldiers of France to shoot down their officers, not their comrades of the labor unions, in the event of a general strike. The pendant to this portrait of M. Briand is that for which he posed last summer, in turn-

ing a deaf ear to the railway strikers and crushing the serpent of riot, not to say revolution.

In advocating the Disestablishment bill before the Chamber of Deputies and the country four years since, M. Briand was not, in general, fanatical. He has done, all told, very little in the cause of rhetoric. As an English journalist resident in Paris words it:

"M. Clemenceau never could resist being brilliant; M. Briand perhaps never had the temptation to face, he certainly never gave way to it. During all the preparation for disestablishment, it was the former who said the words, but the latter who did the things."

There was little enthusiasm about M. Briand's attack upon Rome—it was a question of business and statistics. He did not compete with Combes. Unlike his colleague Viviani, he never discoursed of putting out forever the lights of heaven.

Yet the late Premier's course utterly offended the Catholics, not of France alone, but of the entire world. It was hardly to be expected that they would give him credit for sparing the Church worse treatment than it actually received. For one thing, he denied it, to a great extent, the satisfaction of martyrdom. Tho the law for which he stands largely responsible is severe, he seems to have made the execution of it as gentle as he could. It is for this that he is regarded as tainted with Clericalism—he who "reported" disestablishment!

The worst that can be said of M. Briand, since his exhibition of statesmanlike qualities in the recent railway crisis, is that he is something of a time-server. All recent Premiers—victims of the *bloc*—have been temporizers. So have most prominent French politicians—and the French Radical has been aptly defined as a Socialist without the courage of his convictions.

Such is the new Prime Minister. His Cabinet is regarded as more radical than his predecessor's. Yet it is difficult to regard this new government as destined for long life. Also, it is difficult to discover its *raison d'être*. No appreciable change from the Briand policy was hinted at when M. Monis made his recent declaration of program. All that is clear is that the new ministry was called into being by the hostility of the Combists to Briand, and that M. Monis is thus overshadowed, at the moment, by two figures: that of Théophile Delcassé, his Minister of Marine, within the Cabinet, and that of Combes without it. Yet it is possible that his very mediocrity will save Monis. Here is what the new Prime Minister had to say of the Church and the schools:

"We shall apply without weakness and without violence the laws dealing with the congregations and with the separation of the churches and the state. Recent judgments show what means the existing law places at our disposal for the defence of schools and teachers against insult. If these weapons should prove inadequate we shall ask you for new ones in order to assure the proper working of the schools and to protect from all obstruction our work of laicizing them."

It looks, then, as if Aristide Briand having eliminated himself, Monis would—more discreetly, perhaps—carry out the Briand policy. Briand seems to have failed to give satisfaction to the Deputies because of his scorn of pretenses. He was not sufficiently hypocritical. Yet he seems to have satisfied the country, and, tho he is momentarily weary of parliamentary bickerings, and the difficulties of the group system, and of over-centralization, and of the general insincerity in political affairs, he is, in due time, likely to "come back." No politics are so kaleidoscopic as the French. And, while M. Briand may lack a panacea to offer, tho he is essentially disillusioned, France cannot permanently forget that M. Briand has stood the ordeal by fire. His coolness in parliamentary crises and before the pistol of the "manifestant" is a matter of record. Without being altogether a Man of Destiny, M. Briand can, if he will, plagiarise "Peter Pan," and say: "Napoleon was little, too!"

Avoidable Disasters

Two notable disasters of the week have shocked the country. One of them is a railroad wreck and the other a fire. They call for very different comment. The former appears to have been an unavoidable accident. Machinery will break; with the best of care we cannot always prevent it. Had the break occurred at any other place on the road than just where it did no one would have been killed. It must

be put down to the list of those accidents which perhaps we can never avoid. The other disaster, in this city, is of a very different sort. Here was no act of God; it was the crime of man. It was a fire in the upper stories of a high building, and 150 people, mostly Hebrew and Italian girls in factory work, were killed. There were two criminal faults. In the first place, a building so employed should have been actually fireproof in construction and in furnishing—no wooden floors, no wooden trimmings and no such body of wooden furniture as could gather a flame. Then, again, there should be double protection by abundant means of escape, but here these helpless girls were crowded where escape was so insufficient that they could only jump from the windows, hoping to be caught in the life nets, but the nets were broken, and those who held them beaten down by the rain of the falling bodies. After the people are killed, hundreds of homes broken up, the breadwinners slain and old people and children left helpless, the city authorities are asking where the blame was. That question comes too late; it should have been asked before, not after. The only relief is in the faint hope that there will, for a year, be stricter inspection and more stringent building laws for many cities.

Religious Statistics

We gave lately the number of students in 144 Protestant theological seminaries in this country as 7,899. We have since seen those of the eighty-two Catholic ecclesiastical seminaries, which count 6,969 aspirants for the priesthood, according to Wiltzius's new directory. There are ninety-seven bishops of dioceses. The number of priests is 12,650, of whom more than a third are members of religious orders. The number of Catholics is given as 14,618,761. In the census of 1906 the number of Catholic communicants was given as 12,079,142, there having been made a reduction of 15 per cent. for children. Had they been counted the number would have been 14,210,755, which gives an increase in four years of 408,006. The new Vatican rule reducing the age at which children are to receive the communion to seven years will increase the number included in the next census figures. The increase in four years must be considered in connection with the Catholic immigration. On this latter subject the *Catholic Fortnightly Review*, of St. Louis, says that it has been "denounced as an unpatriotic crank, pessimist, and croaker" for telling the truth. It adds:

"It is our firm conviction, which we have repeatedly voiced in public because we love the truth and the salvation of souls more than the 'glory of our country,' that all things duly weighed, the Church is losing members at a terrific rate in America. There are a good many conversions to the faith, thanks be to God; but they do not by any means offset the number of defections. All the world knows that thousands of immigrant Catholics annually fall away from the faith because they are lukewarm when they come here and find no one to take care of them. Something far less appreciated among us is the enormous defection of Catholics to the manner born. This is due to a great variety of causes. But we shall not be able accurately to gauge the ensemble of these causes and to counteract them, unless we have reliable statistics to go by. . . . What we need above all things at this stage is accurate and trustworthy statistics about our annual gains and losses. The bishops of this country could not perform a more valuable service to the cause of Catholicity than by enabling themselves and the Holy See to get at the true facts regarding this dynamic problem."

The Third National Peace Congress

The holding of national peace congresses is coming into wide vogue. Besides an international congress held every year in some capital of the world, and the yearly sessions of the Interparliamentary Union, England, France, Austria and Italy assemble national congresses yearly. The United States is apparently going to hold one every other year. The first National Peace Congress of the United States was held in New York in 1907, just before the Second Hague Conference was convened. It was the greatest unofficial gathering ever held in the United States in quality and quantity of distinguished speakers and delegates. The following year a peace conference was held in Philadelphia, which, tho only State wide in name, was national in scope. In 1909, the Second National Peace Congress was held in Chicago. Last year a congress representing the New England States was held in Hartford, tho the speakers

there came from all parts of the country. In addition to these, Mr. Albert K. Smiley has been holding, every spring for the past sixteen years, his Mohonk arbitration conferences, while each year since 1907 the American Society of International Law has held a three days' session in Washington, in which most of the papers read refer to international peace. The newly formed American Society for the Judicial Settlement of International Disputes held its first public congress in Washington last autumn. Its six sessions gathered together many of the most distinguished publicists and peace workers in America. And now plans are maturing for the Third National Peace Congress, which will be held from the 3d to the 5th of May in Baltimore. It is hoped and expected that this will be the best peace congress yet brought together in the United States, which is the same as saying in the world, for in no other nation are such important people enrolled in the peace movement. For the first time a President of the United States will attend a national congress. Mr. Taft will open the Baltimore one on Wednesday, at 2 o'clock. If he delivers as important an utterance there as he has already done when speaking at peace banquets he will justify Mr. Carnegie's characterization of him as the greatest living peace leader. Besides Mr. Taft, such other distinguished peace advocates are expected to address the congress as Andrew Carnegie, Baron d'Estournelles de Constant, Nicholas Murray Butler, Richard Bartholdt, Edwin D. Mead, Cardinal Gibbons, James Brown Scott, John W. Foster, Assistant Secretary of State Huntington Wilson, etc. To Mr. Theodore Marburg, one of Baltimore's most distinguished and public-spirited citizens, the promised success of this congress will be largely due, tho it was initiated, as the previous national congresses have been, by the American Peace Society. We trust that many readers of THE INDEPENDENT will find it possible to attend.

Training in Politics

From time to time incidents occur which give support to the prevalent opinion that the education being given to the students in our colleges is not such as to fit them for the practical duties of after life. Such an incident is the election recently held in Columbia University for members of the student board. In both the law school and the college of arts the ballot boxes were found to contain more votes than there were students. The students in the college of science, more prudent or less awake to their opportunities, did not exceed their registrated number. On account of this gross carelessness of the men of arts and law the university authorities were forced to declare the election invalid and to order another. In accordance with the usual custom of critics of educational institutions, we hold the faculty responsible for the affair. It indicates certain deficiencies in the character of the instruction in the political sciences at Columbia notwithstanding the eminence of the professors in that department. These students seem to have received no training in the art of fraudulent voting. The elementary principles of political economy are not to pay more for votes than you can help and not to put in more of them than is necessary to carry the election. The object of student self-government in universities is to give the students practice in the art of politics, but this object is not being attained if methods are allowed which in the world outside the college would lead to the penitentiary. Law students in particular ought to know better than to use such crude and unsafe devices. It reminds one of the early days, before political economy was taught in the colleges, when the border ruffians invaded Kansas in order to carry the election for slavery and voted a large part of the Cincinnati directory in Leavenworth. Such things arouse suspicion and lead to distrust of our most cherished institutions. We would not be understood as including all the universities in this criticism. We are aware that some institutions East and West have turned out politicians who have been distinguished for their skill and success in their chosen profession, such men as Tom Platt, of Yale, and Abe Ruef, of the University of California. Let Columbia look to its laurels.

An announcement put forth by the Yale Divinity School, that it has chosen Charles R. Brown, D.D., of Oakland, Cal., as president, and that it is to organize five departments of instruction, Divinity, Missions, Practical Philanthropy, Religious Education, and History and Philosophy of Religion, does not tell half the story of what is planned. We understand that the Divinity School will seek an endowment of $2,000,000. It will attempt to do a great deal more than teach students that come to it. It will try to do a supervising and co-operative work wherever it can, somewhat as is done by the University of Wisconsin in its State. If a Sunday school is run down it will be ready to send a competent man to set it in good working order. If a town wants wise settlement work it will give its aid. If there is industrial friction the department of Practical Philanthropy will be ready to give impartial advice. This is an ideal plan which ought to be realized.

The Natural History Museum of this city has had an expedition in the Kongo forests collecting specimens in natural history and anthropology. The report from the anthropologist has this to say of one family of negroes—"savages," remember, an "inferior" race:

> "The Mangbetu excel in their iron work; indeed, their well-forged and finely worked knives are masterpieces of negro blacksmithing. Their pottery in its best samples reminds one of ancient Greek work. In producing well-balanced forms of artistic finish they show a very high development. Their carved and ornamented stools, benches, figures and shields, and their hatpins of ivory may well be classed among works of art."

That is, these negroes compare well in their artistic culture with the Greeks of a period not long before Pericles, and are far superior to the Germans and Gauls before Roman civilization reached them.

Here is the case of Robin, the bank-wrecker, who denied his father and mother, and whom half a dozen medical experts declared to be insane. A jury of ordinary citizens said he was not insane, and of course he declared he was sane—they always do, so that does not count. The judge accepted the decision of the jury against that of the experts, and then accepted the plea of guilty, and now the attorneys to whom he is making confessions can no more discover signs of aberration, other than moral, than could those with him in the banking operations. There ought to be some other preliminary and impartial way of deciding as to insanity of those charged with crime.

It is a large number of courageous airmen, thirty-one in all, who lost their lives in 1910 by falling from aeroplanes. Five had died from accidents in 1908 and 1909. It seems a heavy tribute, but compare it with the ninety deaths last year from accidents in climbing the Swiss Alps. The latter were in pursuit of recreation, not useful science. As sacrifices go it is not a heavy sacrifice for achieving the great revolution in human civilization which gives us the command of the air as well as of the earth and the sea.

A much valued contemporary sums its reasons why Japanese as well as Chinese immigration should be restricted in these twelve words: "The Orientals will not make Americans; therefore Oriental immigration should be restricted." An *ipse dixit* indeed! We know why they will not make good Americans—because they are not allowed to.

Le Temps, the semi-official organ of the French Foreign Office, in discussing President Taft's military demonstration, makes the shrewd comment that the troops sent to the Mexican frontier are too many to guard it and too few to cross it.

The Civil Service Commission reports 5,488 more places put under competition the past year, and 8,520 more places recommended to be so placed. Gradually Congressmen are getting time to attend to legislative business, and bosses are losing their power.

Tammany is not without its encomiasts. Mgr. D. J. McMahon, of the Church of the Epiphany, said at a banquet the other day: "Next to the Catholic Church, Tammany Hall is the most powerful organization for good in this city."

Insurance

Is a Cab a Common Carrier?

Is a city cab a common carrier under that general provision of the personal accident insurance policy which makes the company liable for double the usual indemnities if the person insured is injured or killed "while a passenger in or on a public conveyance, provided by a common carrier for passenger service"? It would seem from the disposition made of the Carrere claim by the Travelers Insurance Company that the question is to be answered affirmatively. Mr. John M. Carrere, a distinguished architect of New York City, held a $50,000 accident policy in the Travelers containing the provision for double indemnities for injuries or death while riding in a public conveyance. He was severely injured while riding in a taxicab, and died, as the result, several weeks afterward. The Travelers settled the claim at $116,000. It is recalled that some time last year a Pennsylvania court, in a case involving a similar set of circumstances, held that the claimant was entitled to double indemnities under the contract—virtually declaring a cab to be a common carrier. It remains to be seen whether the accident insurance companies will continue to take this additional risk, or will decide to reform the phraseology of their policies on that point and exclude it. It must be generally admitted that the double indemnities in contemplation when the language quoted was composed had reference solely to accidents common to steam and electric railway transportation.

THE recent decision of the United States Supreme Court approving the corporation tax will mean a revenue of about $28,000,000 a year. It is estimated that insurance companies will contribute over $2,000,000 of this amount.

THE effect of the wind on fire insurance rates is a factor that one would believe negligible, yet cases are known where companies have granted more favorable rates on properties usually to windward of a hazardous building than those to leeward.

THE sixty-first annual report of the Aetna Life, for the year 1910, shows that 1,783 policyholders died during the year. The deaths by ages:

70 and over	642
60 to 69	381
50 to 59	291
40 to 49	223
30 to 39	168
Under 30	78
	1,783

Seven diseases that cost more than 100 deaths each were:

Organic heart disease	238
Apoplexy	185
Bright's disease	174
Pneumonia	142
Tuberculosis	129
Cancer	122
Other diseases of circulation	121

The greatest number of deaths from tuberculosis occurred under the age of 39. Cancer was most fatal after the age of 50; comparatively few deaths from that cause occurred prior to that age. Nearly all the deaths from apoplexy occurred after the age of 50. Organic heart disease and other diseases of circulation were far more fatal after the age of 50 than before. Pneumonia and Bright's disease began to claim their victims at the age of 40. Forty-one policyholders died during the first policy year, about 2½ per cent. of the whole number of deaths. Another 2½ per cent. died during the second policy year. All told 13 per cent. died during the first five years of insurance.

THE most disastrous fire, in the loss of human life, that has occurred in New York City since the burning of the excursion steamer "General Slocum," took place on Saturday afternoon, March 25. A few minutes before the 600 employees of the Triangle Waist Company were to leave for their homes, the building in which they worked caught fire, and 150 lives were lost. The building was classed as fireproof, and the situation is to be rigidly investigated. Prompt relief has been subscribed for the injured and the families of the wage earners who lost their lives.

Financial

Banking Concentration

A LONG step toward the concentration and harmonizing of the most powerful banking interests in New York was taken last week, when control of the National Bank of Commerce (capital, $25,000,000; surplus and undivided profits, $17,005,800; deposits, $141,311,400) was acquired by a group or syndicate representing J. P. Morgan & Co., Kuhn, Loeb & Co., the National City Bank and the First National Bank. For years about one-third of the Bank of Commerce stock has been owned by the Equitable Life and Mutual Life insurance companies, the first holding $5,023,100, par value, and the second $3,608,800. The law enacted after the insurance investigation requires these companies to sell their stock before the beginning of next year. A bill to repeal this requirement is now pending at Albany. To the banking group mentioned above each company has sold one-half of its stock for about $200 a share, gaining a profit by the transaction. Control is thus assured, as the personal holdings of the group probably exceeded 30,000 shares, and both of the banking houses and at least one of the two banks were already represented in the board. It is understood that Frank A. Vanderlip, president of the National City Bank; F. L. Hine, president of the First National, and (probably) Albert H. Wiggin, president of the Chase National, will be made directors. The deposits of the Bank of Commerce, National City and First National amount to $508,000,000. The purchasers of the stock held by the insurance companies are probably the most powerful banking group in the world. They control institutions (banks and trust companies) whose deposits exceed $1,000,000,000.

Prices of the shares directly interested were affected favorably, as is shown by the following report of bank stock sales for last week:

Shares.	High.	Low.	Last.	Net change.
1,817 Commerce	224	208	223	+14
5 First Nat'l	898	898	898	+23
99 Nat'l City	408	400	497	+ 7

There was an advance of 16 points in Hanover shares, Fourth National shares gained 3 points, and bids for the shares of several other banks were raised a little. During the last few months there has been a considerable absorption of bank shares in small lots by careful investors, with some broadening of the market for such securities.

....The Census Bureau's report shows that the cotton crop of 1910 was 11,941,563 bales. The Agricultural Department's estimate was 11,426,000.

....According to the records of the *Journal of Commerce*, investors will receive in April, in the form of dividends and interest disbursements by railroad, industrial and traction companies, $146,971,610, against $141,431,922 in April a year ago.

....Many State banks in Oklahoma are seeking national charters in order that they may avoid the assessments of the deposit guaranty law. Applications from eighty have recently been received at Washington. They assert that the law favors speculative bankers at the expense of those who are conservative.

....It is estimated that the new capital applications of the United States, Great Britain, Germany and France in 1910 were $4,536,049,400, against $4,257,906,000 in 1909. The United States, with $1,518,272,000, is at the top of the list, but these figures show a decrease of $163,000,000, while Great Britain's total, $1,337,195,000, is larger by $425,000,000 than it was in 1909.

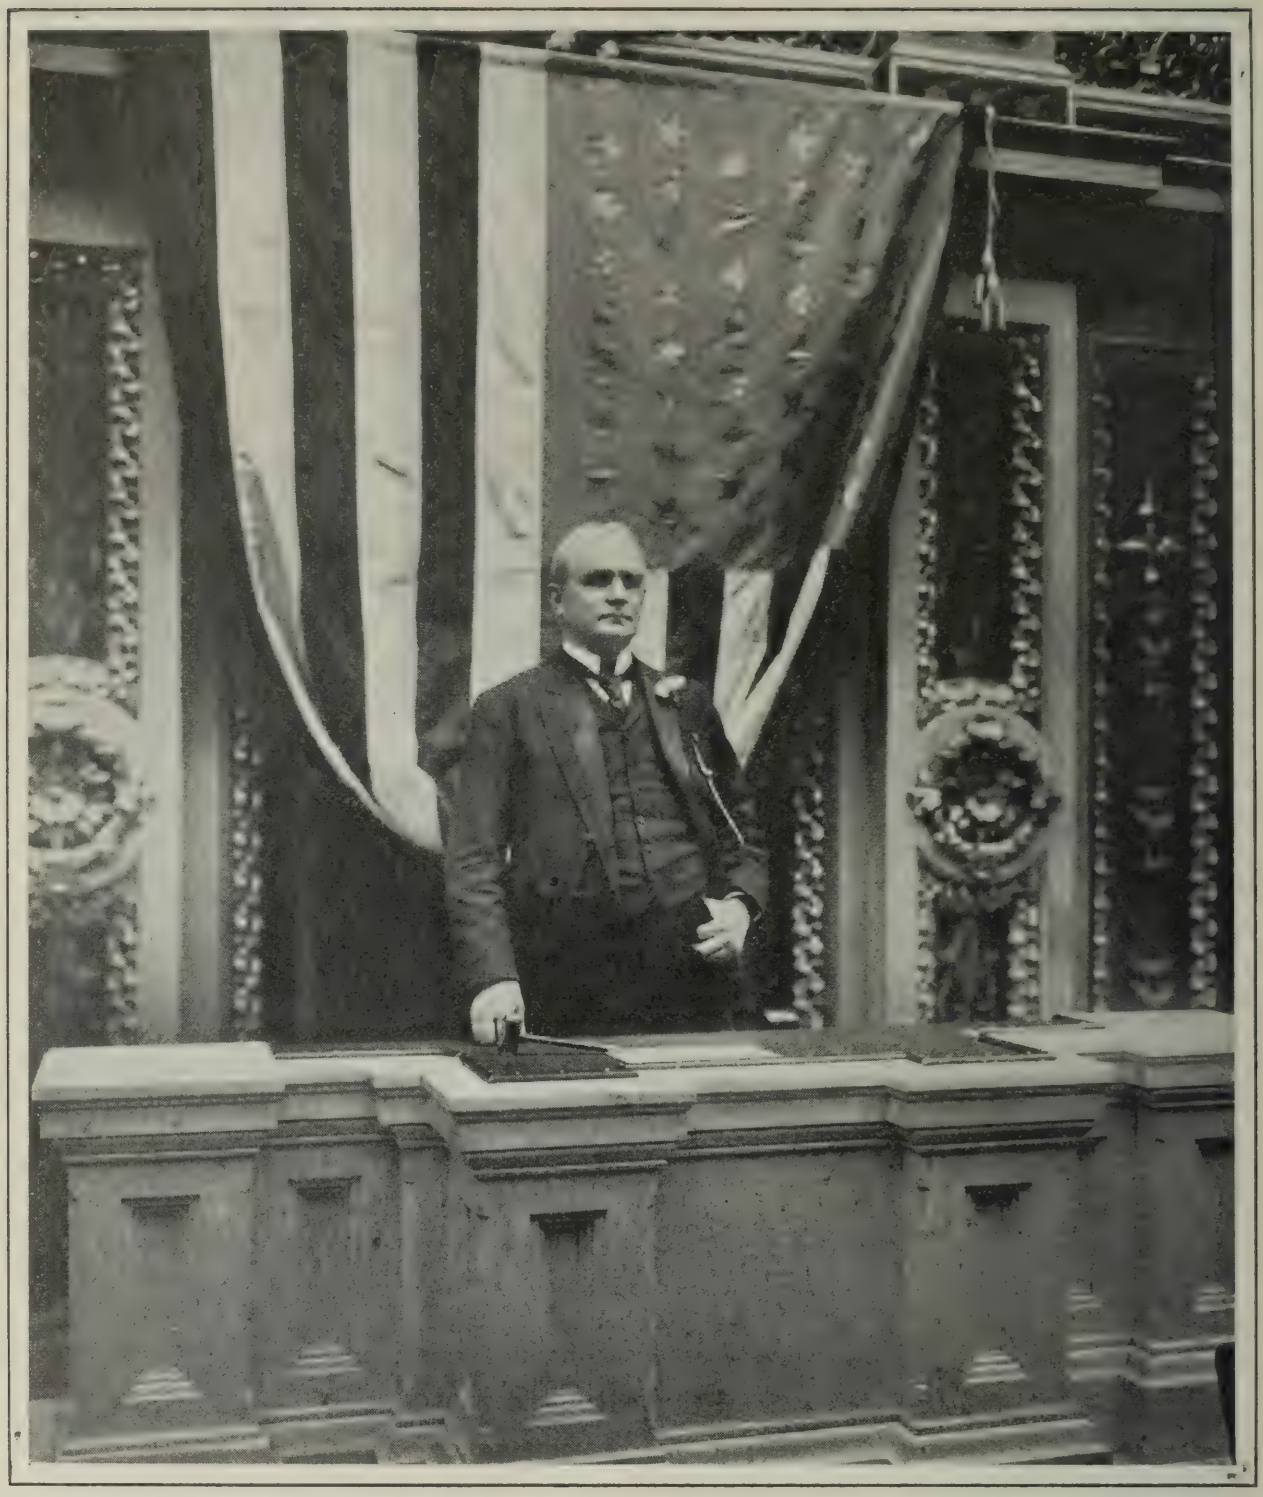
....An excellent article on "The Judicious Investment of Money," by Charles Lee Scovil, of Spencer Trask & Co., is published in the *Bankers' Magazine* for March. It is designed to assist those who desire to invest comparatively small amounts. The field is classified in four sections, each of which is clearly characterized. Careful consideration is given to the requirements of investors. As an example, an investment of $5,000, with a part in each field, is shown, the resulting average yield being a little more than 5½ per cent. In brief space the writer has given much good advice.

The Independent

VOL. LXX NEW YORK, THURSDAY, APRIL 6, 1911 No. 3253

Survey of the World

From the Capital



The special session of Congress was convened Tuesday, April 4. The Democratic members of the House of Representatives, meeting in caucus April 1, approved a legislative program, including President Taft's Canadian reciprocity agreement; abolishing ninety-eight jobs, carrying about $183,000 in salaries and six useless committees; adopting rules much similar to those of preceding sessions, and naming the majority members of the standing committees of the next House. It was resolved that Democratic members of committees should not report to the House during the special session, unless hereafter direced by caucus, legislation other than that providing for the direct election of Senators, the publicity of campaign contributions, reciprocity and the tariff, House reapportionment, inquiries and resolutions upon investigations of executive departments, the admission of Arizona and New Mexico as States, District of Columbia and deficiency bills. The following are named chairmen of the principal committees:

Ways and Means—Underwood (Ala.); Appropriations—FitzGerald (N. Y.); Rules—Henry (Texas); Elections (three committees)—Ansberry (Ohio), Goldfogle (N. Y.) and Hamill (N. J.); Judiciary—Clayton (Ala.); Banking and Currency—Pujo (La.); Interstate and Foreign Commerce—Adamson (Ga.); Rivers and Harbors—Sparkman (Fla.); Foreign Affairs—Sulzer (N. Y.); Pensions—Richardson (Ala.).

——After July 1, magazines and other bulky periodicals will be transported by the post office department in carloads as fast freight. Postmaster General Hitchcock is developing as rapidly as possible the plans which he fixed upon last December to effect a saving to the Government in transportation charges. "The plans," he says, "are not proposed as a solution of the controversy over second class mail rates on the advertising sections of magazines, but may tend to bring about a settlement of that question." Distributing terminals have been established in Boston, New York, Philadelphia, Chicago, St. Louis, Omaha, St. Paul and Cincinnati.

A Democratic Senator from New York

William F. Sheehan retained the support of only twenty-eight of the ninety Democratic members of the Legislature at the reconvened party caucus for the selection of a candidate for United States Senator, held on the night of the 28th. Four insurgents were present. Justice John Aloysius O'Gorman, of the Supreme Court of New York, received one vote in this caucus. Subsequently, his candidacy was urged upon regulars and insurgents alike by Charles F. Murphy, and he was elected by the vote of all the Democratic members, on Friday, the 31st, having resigned his judgeship in time to make his election legal. Earlier there had been talk of fusion between the insurgents and the Republican legislators, to elect an independent Democrat, but negotiations between Senator Brackett, Republican leader at Albany, and Senator Roosevelt, insurgent Democrat, came to nothing. The Senator-elect is in his fifty-first year. He is a former grand sachem of Tammany Hall (1902-1905), but as a member of the Supreme Court of the State has taken no part in politics and has an excellent record. Governor Dix expresses himself as highly gratified, altho he has no personal acquaintance

CHAMP CLARK IN THE CHAIR.
The Democratic Speaker of the Sixty-second House of Representatives.

with the new Senator. Martin W. Littleton, member of Congress from the Oyster Bay district, and a rival candidate for the Senatorship, notes that the election sets at rest "allegations that the insurgents were indisposed to vote for a Roman Catholic and an Irish-American." (Mr. Sheehan's friends maliciously suggested that the opposition to him was based upon these considerations.) Senator Roosevelt pays a tribute to Mr. O'Gorman as judge and citizen. So does Francis Lynde Stetson, who was active in behalf of Mr. Shepard's candidacy; so also do Mr. Shepard himself and Mr. Sheehan. Senator-elect O'Gorman in a post-election confession of faith declares that United States Senators should be

elected by a popular vote, and that immediate downward revision of the tariff is urgent. "I am opposed," he adds, "to the new nationalism," and to the Republican policy of centralization. He will favor a constitutional amendment providing for an income tax, and will vote for Canadian reciprocity. He favors the parcels post and the fortification of the Panama Canal.——After the Democratic legislators had hastened from a long session of their caucus on the night of March 28, fire broke out in the west wing of the Capitol at Albany. We comment on the property loss in our Insurance department. No complete history of the State has ever been written, and none can be written now that the ancient documents in the State Library have been destroyed. The library of the Canadian Parliament will replace in part the loss of the United States Federal and State documents out of its collection of duplicates. These cover a large part of the period between 1850 and 1907.——Since the fire the New York Legislature has sat in the Albany City Hall.

New York's City Charter

Mayor Gaynor's recommendations for the revision of the New York City charter, now presented to the Legislature at Albany, include radical changes in the city administration. In view of the agitation for the prevention of fires, approval was exprest concerning a provision that the Fire Commissioner is to have full power over ordering the installation of fire escapes and over safety appliances. The late disaster in Washington place, New York City, brought out the fact that there was little effective co-operation between the Fire Department and the Bureaus of Buildings. The Mayor wants these bureaus taken out of the Borough Presidents' hands and placed under one Commissioner of the Department of Buildings, to be appointed by him. Another proposal is to increase the importance of the office of City Chamberlain and to reduce the powers of the Comptroller. The Chamberlain is to be known as the City Treasurer, and is to have full control over practically all sources of city revenue, including the offices of the Receiver of Taxes and the Bureau for the Collection of Assessments and Arrears, now in the Finance Department. Similarly, other departments of the City Comptroller's office are to be placed in the charge of various commissions appointed by the Mayor, the whole tendency of the new charter being toward a concentration of power and responsibility. The City Comptroller, under the proposed charter, would be little more than municipal auditor. The present City Comptroller, William A. Prendergast, a Republican, has been out of sympathy with the administration. Perhaps Mayor Gaynor's recommendations are in part influenced by a desire to spare future executives this kind of embarrassment. Unfortunately, the City Chamberlain's office has been the weakest spot in the actual administration. The proposed charter is a much simpler instrument than that now in force, and is only about one-third as long.——Delegations from twenty-five cities of the State appeared before the joint session of the Cities Committees of the New York Legislature last week to argue in favor of several measures providing for a commission form of government. Half a dozen commission charter bills have been introduced this year. The three measures considered last week were bills providing new charters on the commission plan for Buffalo, Mount Vernon and Batavia.

Mexico and the Revolt

Señor de la Barra, Mexico's new Minister of Foreign Affairs, left Washington on the 26th ult. Speaking of the reforms to be proposed by President Diaz, he said it was expected that $40,000,000 of the treasury surplus would be used for the development of irrigation projects, and that 4,000,000 acres would thus be opened to settlement. If holders of large tracts should not volunteer to sell to the Government, parts of their holdings would be condemned. Easy terms would be given to settlers, and each farm would have an area of about 16 acres. As he moved southward, the father and the brothers of Madero started from New York for Texas, and it was predicted that a peace conference would be held in San Antonio.——The names of Mexico's new Cabinet Minis-

ters were announced on the 27th. Of the old Ministers, only Señor Limantour and General Cosio, Minister of War, were retained. It was thought that Cosio would soon be displaced by Gen. Bernardo Reyes, but the latter (in Paris) said that he had not been asked to return, that he was not needed, and that President Diaz, his "friend," was fully competent to deal with the situation. The new Cabinet, Limantour excepted, is not satisfactory to the revolutionists. The relatives of Madero, after their arrival in San Antonio, talked freely about the prospect of peace, predicting a settlement within thirty days. They declared that at the conferences in New York it had been agreed that the Cabinet should resign. Limantour, they said, would soon succeed De la Barra as Foreign Minister, and Vice-President Corral would retire. When their remarks were reported to Limantour, he said that if they really desired peace they should not talk so much. The Government would not yield to the revolutionary party as such.——President Diaz, on the 1st, read his message of 16,000 words to Congress. His voice was clear and strong. His single aim in renewing the Cabinet, he said, had been to avoid carrying on the Government indefinitely with the same Ministers, and to make room for new energies. The progress of the nation had been checked by the revolt of grossly deceived men. It was the Government's purpose to give heed to reasonable complaints. He exprest his approval of "the principle of no re-election for executive officers elected by popular suffrage," and would support a bill embodying it. New electoral laws should be amended, "to insure the electoral activity of those who are considered capable of voting with a full consciousness of what they are doing." Measures would be taken by the Executive to cause a division of large rural estates and to make them available for tillage. Bills for reform in the administration of justice would be proposed, to insure the independence of the judiciary and to "obtain a more select personnel." Speaking of the revolt, he said:

"On the date set for the general insurrection various groups, composed of the peasant class, rose in arms in the mountainous region of Western Chihuahua, taking advantage of favorable local conditions enabling them to defend themselves. These circumstances, together with the efficacious co-operation which the rebels have received in men and warlike supplies, both from foreign sources and from a group of Mexicans who for years have conspired, not only against the present Government, but also against all social order, afford a ready explanation why it is that the revolt has gradually extended over almost the entire State of Chihuahua, and to sundry points in the States of Sonora and Durango, notwithstanding the efforts of the Federal Government and the Governments of the several States in question to check it."

He had asked for an explanation of the movement of United States troops to the border, and his inquiry had crossed, on its way, an assurance from President Taft that the movement had no significance which "should cause concern" to Mexico. He saw abundant proof of the sincerity of this assurance.——In conferences with members of the Foreign Relations committees of the Senate and the House, last week, President Taft explained why the troops had been sent to Texas, showing confidential reports which indicated an alarming situation in Mexico. While these reports were not made public, the legislators, as a rule, exprest their approval of the President's course. By giving them the information which had come to him he enabled them to meet the attack which is to be made in Congress by Senator La Follette and others.——In a statement published on the 3d, Madero, the revolutionist leader, says the Cabinet changes came too late and were insufficient; that the revolutionists will not lay down their arms until last year's elections are declared null and void, and new ones ordered, with a free ballot guaranteed; that the proposed land reform project is a good one, but is in bad hands, and that General Reyes as Minister of War would be "a despot worse than Diaz." Illiteracy, he adds, should be no bar to suffrage.

Madero's Men Still Fighting

Several small towns in Chihuahua or Sonora were captured, last week, by the revolutionists, whose purpose was to take such funds as could be found in tax offices and post offices. In Guaza-

parès (Southwestern Chihuahua), where no resistance was offered, the Mayor, the Postmaster, the school teacher and eight other prominent citizens were lined up against a wall and shot. There were battles at Ures and San Rafael (not far from Hermosillo, the capital of Sonora), which continued for two days. San Rafael was destroyed by a fire which followed the wrecking of a flour mill by dynamite. In these engagements the rebels were beaten, and about seventy of them were killed. Knowing that they had tapped the telegraph wires, the Government sent decoy messages by means of which they were entrapped. At Ojinaga, near Presidio, Tex., 300 Government soldiers were still besieged by 1,000 revolutionists, who surrounded the town three weeks ago. Colonel Rabago, with 1,100 soldiers, arrived safely at Chihuahua City, altho it had been said that Orozco's army had placed him in great peril. In the Mexican capital a plot to release many political prisoners was discovered, and fifty men were arrested. In another plot, to capture the barracks at Tacabuya, a suburb, several officers of the army were found to be implicated. There were rumors of uprisings impending in the city, and it was said that the wires by which electric power for lighting the streets and moving the street cars is transmitted from a point 110 miles away were to be cut by revolutionists. ——Salvadore Madero, uncle of the insurrectionist leader, who is said to have come to San Antonio on a peace mission, was arrested on the 2d, immediately after crossing the Rio Grande, while on his way, as he said, to visit his father, who is ill. It had been reported that he was an agent sent by Limantour to confer with the Maderos in San Antonio.

South and Central America

An agreement was signed at Lima, on the 31st ult., by representatives of Peru and Bolivia, assuring amicable relations between the two countries pending the submission of the boundary dispute to The Hague Tribunal.——The Brazilian state of Minas Geraes recently negotiated a loan of $10,000,000 in Paris. During the last ten months it has borrowed $50,000,000 in France.——In Venezuela the courts have annulled the agreement or contract relating to the purchase of the Imitaca iron mines by a company in which Charles M. Schwab, of New York, and the Bethlehem Steel Company are interested.——A military tribunal, sitting at Cape Haytien, has condemned to death twenty-two political prisoners alleged to have promoted the recent revolution in Hayti. The foreign consuls protest against this judgment. ——Dr. Francisco Beltran, the new President of Honduras, was inaugurated on the 28th ult., when an address, expressing good will, was made by the retiring President, Señor Davila, who had been deposed by the revolutionists and the peace conference. A few days before this inauguration there was a battle between two parties of Government troops at Comayagueta, a suburb of Tegucigalpa. They had been brought from the north to defend the capital and had not been disarmed. The two commanders, General Palma and General Lara—the latter a veteran of Nicaragua's revolution—were killed, and with them forty-three soldiers. Among the fifty persons wounded were several spectators. Order was restored by Government troops under the command of General Matuty, another veteran of the revolution in Nicaragua.——The convention which the Senate at Washnigton has been asked to approve, and which concerns the proposed loan to Honduras, provides that enough of the customs revenue to pay interest and establish a sinking fund for the redemption of the bonds shall be deposited in New York.——The Nicaraguan Government proposes to issue $15,000,000 in bonds, for refunding purposes, it is alleged; but the people regard the movement with suspicion, and Congress may withhold consent. It is reported that President Estrada, realizing that he is only a figurehead, has thrice attempted to resign, Congress declining to accept his resignation. Dispatches from the capital say that the real ruler is General Mena.——Chili's Government invites bids for engineering work, involving an expenditure of $15,000,000, at the ports of Valparaiso and San Antonio.

British Politics

Now if ever is the opportunity of the Liberals to carry out a program of constructive legislation, for their parliamentary majority is large and is backed by the moral support of a double election, the finances are in satisfactory condition and the Opposition is disorganized and lacking both in leadership and policy. The House of Lords, which hastily passed reform resolutions just before the last election, is making no attempt to carry them out, and it is generally admitted to be impossible to get the Lords to agree upon any definite plan. The Liberals, on the other hand, are in no hurry to reform the upper house; they are quite content to limit its powers. The Radical wing of the Governmental majority do not want the House of Lords reformed at all. They would prefer it abolished. All of the plans that have been proposed have this fatal defect in Liberal eyes that they would leave the House of Lords almost as certainly Conservative as it is now and make it very much stronger. Another proposal emanating from the Unionist side was the establishment of the referendum as means of settling disputes between the two houses. This, however, met with the same fate as the reform measures. The referendum bill introduced by Lord Balfour of Burleigh, under the title of a "Poll of the People," failed to command a majority even of the Opposition in the House of Lords. Some of the peers would prefer the Government veto bill. The latest move of the Opposition is a resolution, presented by Lord Lansdowne, praying the King to consent to the introduction of a bill for the reform of the House of Lords and "limiting the prerogatives of the Crown in so far as they relate to the creation of peerages." This was intended to checkmate the Government by depriving it of the power to create enough new peers to carry thru the veto bill. It was met, however, by the announcement of Lord Morley, Liberal leader in the Upper House, that the Cabinet would advise His Majesty to assent to the introduction of such a bill. Lord Rosebery, who now occupies an intermediate position, denounced the Unionists for the use of such futile tactics, and the Liberals for recklessly attacking the constitution to secure a temporary partisan triumph.——The gross revenue for the fiscal year ending March 31 amounts to $1,019,252,940. This is the first time that the income of the Government has gone above the billion dollar mark. The estimated expenditure for the coming year amounts to $90,500,000. The increase is chiefly due to the back taxes for 1909-10, which were not collected owing to the dispute over the budget, and much of the surplus will have to be applied to the sinking fund, which was depleted during the crisis. ——The strike of the Welsh coal miners still continues with bitterness and obstinacy on both sides. The 12,500 employees of the Cambrian Coal Trust, who went out on November 1, were at first supported by a strike fund of $600,000 of the South Wales Miners' Federation, but this is exhausted and the aid received from the Miners' Federation of Great Britain, $15,000 a week, is not sufficient to maintain the men much longer. Rioting is frequent, and a large force of special police has to be maintained in the region to protect the officials.——The suffragets seized the census as an occasion for demonstrating their opposition to the Government. If they could not vote, they would not be counted. On the night of April 2, when the census was taken, many left their homes to hide with friends, and about a thousand, under the leadership of Mrs. Pankhurst, spent the night at a skating rink, where speeches and musical and dramatic entertainments were given to occupy the time.

Arbitration Proposals

When the question of President Taft's plan of unlimited arbitration came up in the German Reichstag it met with a very different reception from the Government than it did in the British Parliament. Chancellor von Bethmann-Hollweg declared both universal arbitration and limitation of armament are impossible of realization so long as men are men. He said:

"It will remain true that the weak will be the prey of the strong. If any nation feels that it is unable longer to spend certain sums for defensive purposes it will inevitably drop to the second rank. There will always be a stronger one ready to take its place. We Germans in our exposed situation can shut

our eyes to this dire reality only so far as we can maintain peace.

"The nations, including Germany, have been talking disarmament since the first Hague conference, but neither in Germany nor elsewhere has a practical plan been proposed. Great Britain wishes the limitation of armaments, but simultaneously wants a superior or equal fleet. Any conference on this subject is bound to be fruitless. No standard for a limitation can be found and any conceivable proposal would be shattered on the question of control."

The Chancellor held that any attempt to control the military and naval affairs of another nation would be futile and would have no other result than continual mutual distrust and universal turmoil. He instanced the attempt of Napoleon to limit the Prussian army when Prussia, while adhering to the letter of the treaty, trained a fourfold army by shortening the period of training. The Chancellor said that Germany was willing to accept the English proposal for an exchange of information regarding naval construction programs. Count von Kanitz, a Conservative member, in discussing the question, contrasted the Guildhall speech of Commander William S. Simms, for which he was reprimanded by President Taft, with the speech of Congressman Champ Clark on the annexation of Canada, and said: "While an American naval officer is assuring England of the friendship of the United States, a future President of that nation is talking of the absorption of Canada." He said that reciprocity raised the question of what compensatory favors were to be had by Germany. When the question came to a vote the Reichstag, by a large majority, rejected the resolution of the Socialists calling for immediate steps leading to an international agreement for limitation of armament, and adopted a resolution calling on the Chancellor to declare his willingness to enter into mutual negotiations with the other great Powers as soon as propositions concerning a simultaneous and equal limitation of armaments are made by any one Power. All of the Socialist and many of the Liberal papers criticise the Chancellor for his repellent attitude toward the proposals. ——In England a vigorous peace campaign is being carried on in the churches and religious press. On the other hand, Canon Carey, of York Cathedral, in his Lenten sermon, eulogized war as the school of enthusiasm, love of adventure, heroism and self-sacrifice.——The Secretary of State, Mr. Knox, and the British Ambassador, Mr. James Bryce, are engaged in conferences on the details of the proposed Anglo-American arbitration treaty. Mr. Bryce denied the report that the alliance of Great Britain with Japan would interfere with an arbitration treaty with the United States.

The Canalejas Cabinet

Francisco Ferrer, founder of the anarchistic schools of Barcelona, is exercising more influence over Spanish politics since his execution two years ago than he did while alive. A discussion of the affair in the Cortes forced the resignation of the Canalejas Ministry. The Republicans introduced a motion for the revision of the court martial, and in a three days' debate bitterly attacked the army and Señor Maura, who was in power at the time. Deputy Soriano, who opened the debate, asserted that none of the charges against Ferrer constituted rebellion, and that the execution was a political measure for which the Conservative Government and party were responsible. He declared that the court martial had occupied only four hours in examining the papers of the case, which amounted to 1,200 pages of printed matter. Premier Canalejas defended the Government in moderate language, asserting his belief that the sentence of Ferrer was just, but recognizing that the military code might be modified with advantage. He refused to reopen the case because it was beyond the jurisdiction of the Government. The controversy, however, revealed dissensions in the Cabinet, for General Azenar, Minister of War, offended by the denunciation of the army and dissatisfied with the tone of Canalejas's defense, demanded that the debate on the Ferrer question be suspended immediately by a majority vote. The Premier presented the resignation of his Cabinet, but at the request of the King he formed a new Ministry. The only alternative to a Canalejas Ministry would be a military government, and Canalejas commands the confidence of a larger number of the Liberals than any other man, and even the Conservatives, opposed as they are to his

policy on the friars question, fear that his successor would be a Premier whose anti-clerical policy would be more pronounced.

The Loetschberg Tunnel

The piercing of the Bernese Alps was accomplished on March 31, when the workmen from opposite ends of the Loetschberg Tunnel met each other 4,000 feet below the ground. This tunnel was started in the latter part of 1906, and the total cost has been $20,000,000. It is about 9 miles long, being exceeded by the St. Gothard (9¼ miles) and the Simplon (12½ miles). It is 9 yards wide and 19½ feet high, providing for a double track of standard gauge. It follows a winding course thru the mountains and involves in its approaches twenty-four bridges and viaducts and thirty-four tunnels. Fifty laborers lost their lives in its construction, some of them from an inundation caused by the tapping of a subterranean lake. The expense of the new tunnel has been shared by the French railroads and the Swiss Government for the purpose of regaining the traffic which has of late been diverted thru Belgium and Germany. The most direct route from London to Italy will now be from Calais or Boulogne to Berne, along Lake Thun to Spiez, thence to Frutigen, and by the Loetschberg Tunnel to Brieg, where the Simplon Tunnel may be taken to Domodossola, in Italy.

Antarctic Exploration

The whaler "Terra Nova," which left New Zealand on November 29, returned to Christchurch, March 27, having landed Capt. Robert F. Scott with his party of twenty-five men at McMurdo's Sound in January. The sound is exceptionally free from ice, and winter quarters were established at Cape Evans, eight miles north of Discovery Station and eight miles south of Cape Royds. In conveying the supplies across the broken ice, a mile and a half to the shore, one of the motor sledges was lost. The expedition is supplied with fifteen ponies and thirty dogs. It is Captain Scott's plan to make a preliminary expedition to the southward and establish a base of supplies at the foot of the Beardmore glacier, then in October to return to this and push on to the South Pole. This is the line which Captain Scott took in 1902 and which was followed by Shackleton in 1908 when he came within 111 miles of the Pole. The "Terra Nova" discovered a rival party in the race for the Pole, Capt. Roald Amundsen, who had landed upon the ice barrier at the Bay of Whales. Amundsen has the "Fram," which was Nansen's ship, and with him are eight men, with 116 Greenland dogs. The "Fram" left Madeira last October, and it was generally supposed that it was bound for the Arctic regions. It is, however, stated that Scott was notified by Amundsen of his intentions. The Japanese are also reported to have sent out an expedition to discover the South Pole.

Progress in Aviation

Louis Bréguet, who has been devoting himself to the development of the carrying capacity of the aeroplane since last summer, made a flight at Douia with eleven passengers. The weight of the twelve persons was 1,300 pounds, and the monoplane weighed as much more. The flight covered a distance of about two miles at a hight of 50 to 75 feet above the ground.——On March 31 Pierre Vedrine made a flight from Poitiers to Issy, a distance of 181 miles, in 2 hours and 12 minutes, which was at a rate of about 90 miles an hour. Express trains require four hours between these two points.——The American army aeroplanes are reported to be doing good service in patroling the Mexican border. ——Sir Hiram Maxim has resigned his position as director in the firm of Vickers, Sons and Maxim, on his seventy-first birthday, in order to devote himself to military flying machines. He has associated with him Grahame White and Blériot. Their purpose is to develop two types of machine, a light one for reconnoitering, and a larger type capable of carrying a 500-pound bomb charged with high explosives.——Wilbur Wright is defending his patents in the Paris courts. The French constructors do not deny having copied his designs, but claim that the publication of reports of his early flights in the American journals made them public property.

The Value of Canadian Reciprocity

BY SAMUEL W. McCALL

[In the following two articles the views of those in the Republican party who oppose, and of those who support, the reciprocity agreement with Canada are represented. Mr. McCall, of Massachusetts, who introduced and advocated the Reciprocity bill, and Mr. Fordney, of Michigan, are Republicans, and both were members of the Committee on Ways and Means at the recent session of Congress.—EDITOR.]

IN the Canadian reciprocity measure, which for some time past has been under discussion in Congress and thruout the country, I believe that the President of the United States has risen above the narrow interests of localities and that he has comprehended the whole country; that he has not been swayed by the clamor of special interests, but that he has had the wisdom and the courage to negotiate an agreement in the interest of the masses of the people; and I trust that it will prove the establishment of a policy of enlightened statesmanship, and of high patriotism, and of single-minded justice.

The measure as presented to Congress by the President contained three schedules. First, of articles upon which, in accordance with the agreement with the Canadian Government, there is an identical rate of duty provided in the two countries; second, articles all of which are placed on the free list by both countries; and, third, a schedule in which the Government of one country agrees that certain duties upon certain articles may be remitted, and the Government of the other country agrees that other duties upon the same or other articles may be remitted. But there is not an equality of duties in the latter schedule. That was the general scope of the agreement.

It took a long step toward establishing for the Continent of North America a policy of unrestricted trade and commerce, recognizing natural conditions that have been too long ignored. It was based upon just principles and designed fairly to secure the mutual advantage of the two nations. The President wisely said, in his message, that in such an arrangement "an exact balance of financial gain is neither imperative nor attainable." The duties proposed to be remitted by the United States yield about twice as great a revenue as those remitted by Canada. But Canada's concessions bear a much larger proportion to her total income than do our concessions to our total income. And it must also be borne in mind that we are likely to gain as greatly by what we give as by what we get.

In criticising the measure the question was frequently asked, for example, why beef was not put on the free list. Presumably the President of the United States made the best trade that he was able to make in the matter. The Canadian rate on beef is now 3 cents a pound, and the rate on beef coming into this country is 1½ cents. Naturally, Canada, with her packing industry, did not desire to remove her protective duty entirely. Those who now ardently desire to smash the Beef Trust surely know that with beef reciprocally free, our great packing industry would crush all competition across the line and add Canada to its empire. It was a reasonable precaution of Canada, and the agreement fixt a mutual rate of 1¼ cents a pound.

Another objection has been that we were only getting a small market—that we were exchanging a market of 92,000,000 people for a market of seven or eight millions. But they who made it forgot that we should all enjoy the common market. It requires but little discernment to see that when you add a small market to a great one, the result is a still greater market for the common enjoyment of all. Thus in the operation of this measure, to the extent that it gave the two countries a greater market, it would confer a benefit on both. And when population is taken into account, there is no country in the world that approaches Canada in amount of purchases from the United States. Excepting cotton, in which we have a practical monopoly, the United Kingdom is the only country which purchases a larger aggregate of our products. Excepting cotton, Germany, with eight times

as many people as Canada, buys only $120,000,000 worth of us, as against $231,000,000, or a trifle less than twice as much, taken by Canada. France buys but $54,000,000 of us, cotton excluded, and even the United Kingdom buys barely a third more than is taken by her colony.

He must be blind indeed who cannot see her remarkable preeminence in the commerce of the United States. Canada buys from us 50 per cent. more than she takes from all the other nations of the world combined. In methods of production, scale of living, and racial characteristics, no other nation so strongly resembles this country. The forces of nature draw the two countries commercially together with a potency which cannot be nullified by mutual tariffs and by the other devices by which statesmen keep nations asunder. The two countries have a common frontier of 3,700 miles, not including the Alaskan boundary, which would add 1,600 miles more. It is not a natural frontier made up of mountains and other barriers difficult to cross. For the greater part of the distance it is purely artificial in character, and the rest is composed of great navigable lakes and rivers. Nature never more forcibly tempted two nations to trade with each other.

The attempt to set aside the decrees of nature by artificial tariff barriers has injured both countries, but on account of her configuration, Canada has suffered more than the United States. It was a problem of the utmost difficulty to establish a coherent industrial and commercial structure over those vast stretches of longitude with little latitude, over almost impassable mountain ranges running north and south. Commerce would naturally break across the boundary in a hundred torrents, but the currents of Canadian trade flow feebly, being forced as they are through an artificial channel for thousands of miles in a single direction.

To this artificial condition is due the slow development of Canada. That a country with her vast wealth of forests and mines and with hundreds of thousands of miles of rich and unsettled lands should only have increased from three and one-half millions of people to eight millions in the last half century, is a striking circumstance, and one, it may be added, for which we must accept a large measure of responsibility. For example, when we yielded to the influence of the lumber interests, and denounced the Elgin treaty, we not only suffered in consequence the tragic waste of our own forests, but we forced upon Canada a condition under which she has had but a slow and cramped growth.

If we remove this condition she will soon gain the strength and stature of a great nation. And the benefit to us will be enormous. If we could sweep away all tariffs between the two countries it would have the effect of another Louisiana Purchase. If her commerce is so important to us when she has only eight million of people, what will be the magnitude of our trade when she has twenty-five million? In trade it is with nations as it is with men. When you increase the purchasing power of your customer you increase your own prosperity.

A great deal has been said about the terrible calamity which reciprocity with Canada is going to bring upon the agricultural interests in the United States. But when I scan the commerce of Canada and the United States, when I see that we send fifteen times as many eggs to Canada as Canada sends to us, that we send nearly as much wheat to Canada, notwithstanding our great flouring mills, as Canada sends to the United States; when I see that, notwithstanding existing tariffs, we send twice as much butter to Canada as Canada sends to us, I can see no threat to the agricultural interests of the United States. I am not sure whether these objections have emanated from the farmers themselves, or only from the official machinery of their various organizations; but the interests of an occupation which lies at the foundation of the prosperity of the nation demand the most serious consideration.

Take wheat, for example, the most important product of Canada covered in the proposed reciprocity. In 1909, Canada raised nearly 170,000,000 bushels of wheat, exporting 57,000,000 bushels, either as wheat or flour. Our export, in the same year, amounted to more than 114,000,000 bushels. Our export to Canada was greater than our import from

Canada. We now impose a duty of 25 cents a bushel, which the reciprocity agreement proposes to entirely remove. Both countries have long been exporters of wheat, but the surplus in the United States has been steadily decreasing, while the surplus in Canada has been steadily increasing.

There is little risk in the assertion that our tariff has never affected the home price of our wheat, however beneficent it may appear upon the statutes to the farmer. The price of wheat in wheat-exporting countries is substantially adjusted with reference to the price in Liverpool. That condition is likely to continue till the growth of our population is such that our consumption is pressing upon our production—and the day is not far distant—when we shall become importers, not exporters, of wheat. when instead of a surplus we shall not have enough wheat for our own needs, and we shall be buyers in the open market. Obviously that circumstance will raise rather than lower the price of wheat in the world. That necessity will, for the first time in our history, make any tariff we may impose upon its importation a factor in fixing our domestic price. A tariff, then, would make still higher to our consumers the price of wheat in the world's market. But such a circumstance is certainly not necessary to the prosperity of our wheat growers, who are prosperous now, with the price fixed in the open market of the world by the general law of supply and demand, and who, indeed, have never known any other condition. It would be inhuman to the great mass of the people to increase by law, at the moment when there was a domestic scarcity, the price of the bread they eat, in order to increase the profits of an already profitable industry. When that time shall come it will be a great blessing to all our people, and especially to the poor, that they can turn to the nearby wheat fields of Canada. For the Government to intervene artificially to increase the price of bread, would be intolerable. The American farmer will never desire to augment his prosperity in any such way, and till then the tariff has no effect in increasing the price of his production.

On the other hand there is an immediate advantage to be gained from the removal of the duty on wheat. Our tariff dike has the effect of preventing millions of bushels of Canadian wheat from coming across the border and of turning this traffic instead, thru artificial channels, to seek the seaboard. If it were broken down, great quantities of the wheat would come to us; but would it decrease the price of our wheat? By no means! That price is fixt by the world's price. For every bushel which came in at Manitoba, so long as we have a surplus, another bushel would go out at New York. The natural destination of great quantities of wheat of the Canadian northwest is Minneapolis. The difference in quality of Canadian and American wheat is such that in mixing the two a better flour can be made than from either alone; and if we did not restrict its importation a great impetus would be given to our flour-making industry, and to the trades dependent upon it, and to foreign shipments of the manufactured product, to the advantage of this country.

The same can be said in great measure of all products. If, for example, by the mutual withdrawal of the duties on barley, more of it should come into New York from Ontario, more of our barley would have to cross the line from Wisconsin and the States farther to the westward, and the useless hauling of Ontario barley to Western Canada and of our Western barley to New York would be eliminated, together with the heavy freight charge which is now a tax upon the general agricultural interests of both countries. The mutual commerce of the two countries in all the products of agriculture does not disclose at any point any serious threat to the interests of the farmer, and he will get an undoubted advantage in the free admission of important articles which he consumes and in a wider market for some of his products.

Nor is it at all clear that the free-fish provisions of the proposition might not put the deep-sea industry upon a better basis, instead of causing the ruin which has been predicted. There is no doubt that its prosperity has been for years declining under the present system. During the periods when fish have been admitted free of duty, Gloucester, the home port of our greatest fishing fleets

and the center of the salt-fish industry, enjoyed prosperity. For the years between 1875 and 1885, the population of the city increased as much as in the last twenty-five years, tho during the first period fish were free, and during the second were subject to duty. During the free period, production reached proportions from which, after the restoration of duties, it steadily declined. At least the curing and salting industry would probably gain. It might be that the fleets would continue to dwindle as they are unmistakably dwindling under the present system, and very likely the fishermen of Canada might seek the benefits of the provision; but the fish-curing industry would follow the fresh fish. There is no market for fresh fish in Canada at all comparable with that of our New England cities, and when the product of the fleets is brought to market, in the sorting of the catch and in the temporary fluctuations of the price of a very perishable article, many of the fish have to be used in the curing industry or thrown away. To the extent, therefore, to which the Canadian fleets resort to our markets, they will transfer to us the fish-curing industry, and we shall gain more than we shall lose. Even if it should not prove a consequence of the provision to stop the decline, which clearly appears in the fishing part of the industry as at present conducted, and if some of the sailors should be turned from a perilous and wretchedly paid calling into safer and more prosperous pursuits, the result would not be wholly evil.

The Canadians have not looked with unlimited favor upon the proposition. Only fifteen less than a majority in Canada's House of Commons were against it on the first test vote. Some of the farmers of Canada are as alarmed as some of our own farmers; but they have only to look at the broad aspects of the case, at the great value and benefit which reciprocity may be to both countries, to have their fears entirely dispelled.

If it were proposed to add to this country today another Louisiana Purchase, if it were proposed to add two or three new agricultural States, who would there be to deny that such a circumstance would augment materially the prosperity and wealth of the two? To the extent to which this agreement goes, it is precisely what the advocates of the proposition endeavored to accomplish.

WASHINGTON, D. C.

Danger in the Misnamed Reciprocity Scheme

BY JOSEPH W. FORDNEY

ABRAHAM LINCOLN once said: "I do not know much about the tariff, but I do know this much: When we buy goods abroad, we get the goods and the foreigner gets the money; when we buy goods made at home, we get both the goods and the money."

No more correct definition of our policy of protection was ever given than in those few words uttered by President Lincoln.

Peter Cooper said: "No goods purchased abroad are cheap that take the place of our own labor and our own raw material."

In a public utterance, not long ago, President Taft is quoted as saying: "The present business system of the country rests on the protective tariff, and any attempt to change it to a free-trade basis will certainly lead to disaster. I did not agree, nor did the Republican party agree, that we would reduce rates to such a point as to reduce prices by the introduction of foreign competition. That is what the free-traders desire; but that is not what the Republican platform promised, and it is not what the Republican party wished to bring about."

Something has certainly occurred to bring about such a change of heart in the President as took place between the

time when these words were uttered and when he approved of the so-called Canadian reciprocity trade treaty.

It is not a Republican measure. It is not a Democratic measure. Under the Constitution all bills raising revenue must originate in the House of Representatives; but up to the time when the President's message informed Congress that he had entered into a trade agreement with Canada, the House of Representatives knew nothing whatever about it. It is safe to say that no member of Congress had been consulted as to the agreement or as to its terms. Two days after the message was received, a bill, drawn by the State Department, was introduced in the House, and after less than a week in the Committee on Ways and Means, it was forced to a vote, amendments were denied consideration, and the bill was reported to the House to be passed without amendments.

Four general classes of products were to be affected by the bill: First, leading food and agricultural products. These were put on the free list. Second, such food products as fresh and canned meats, flour, and partly manufactured food preparations. On these the rates of duty were made identical. Third, manufactured articles—vehicles, cutlery, etc., on which rates were reduced. Fourth, articles upon which special rates are fixt by each country.

In a speech in the Canadian Parliament, Mr. Charlton, speaking for a reciprocity trade arrangement with the Unite States, said:

"The American policy has been applied not only to us but to all the world. The object of the United States has been to sell all that it possibly could of the products of its soil and its mills and its workshops, and to buy just as little as it could from other countries, and thus having as much of the balance of trade in its own favor as possible. The result has been that the balance of trade in favor of the United States last year amounted to $600,000,000 against the whole world—$71,000,000 against Canada. That is a good thing for the United States, and will be her policy as long as the rest of the whole world will permit her to do it, but it is not a good thing for us.

"Something must be done to change the trade conditions that exist between the United States and Canada. Free trade in natural products would afford a reasonable adjustment. Nothing short of this will do it, and this condition of free trade of natural products must be granted by the United States without a solitary concession from Canada further than it has already made. We can not afford any more."

Is it not an astounding proposition that we should deliberately be directed to legislate away all of our advantages, wholly in the interest of Canada; that we should annually throw away of our revenues $5,000,000, in exchange for the surrender, by Canada, of a possible $2,500,000; that we should throw open the market of 92,000,000 people to the market of 9,000,000? The proposition is so startling that it staggers belief.

I make the assertion boldly, without fear of successful contradiction from any man, that there is not one item of reciprocity in this trade treaty with Canada. Reciprocity in competitive articles is preposterous. It is too manifest to be the subject of argument, that to impose a duty on a foreign article for the purpose of preserving the home market for a like home-produced article, and then to remove the duty, so as to admit the foreign article into competition in the home market, is not reciprocity, but is abandoning the principle of protection and adopting the principle of free trade. That is precisely and all that this trade treaty amounts to.

Every duty imposed by the existing tariff law, less than two years ago, on the articles of the agricultural schedule, was imposed for the express purpose of preserving the American market for the American, as against the Canadian farmer—nothing else. To remove those duties now, to let in the Canadian farmer, abandoning our own, is not reciprocity. It is a most unjust and obnoxious form of discriminating free trade.

Charles Emory Smith, late Postmaster General, defined reciprocity clearly when he said: "The principle is axiomatic. Brazil grows coffee, but makes no machinery. We make machinery, but we grow no coffee. She needs the fabrics of our factories and forges, and we need the fruits of her tropical soil. We agree to concessions on her coffee, and she agrees to concessions on our machinery. That is reciprocity."

President McKinley, in his inaugural address in 1897, said: "The end in view

should always be the opening of new markets for the products of our country by granting concessions to the products of other lands *that we need but cannot produce ourselves,* and which do not involve any loss of labor to our own people, but tend to increase their employment by increasing their market."

This trade treaty involves the granting of concessions to the products of Canada which we do not need, which we can and do produce ourselves (at greater cost, because we pay higher wages), and this involves an absolutely certain and very material loss to our farmers. It simply makes a trade agreement with Canada similar to the one which existed from 1854 to 1866, the operation of which proved so disastrous to the United States that it was abandoned. As a business proposition it is wholly indefensible. Advantages under it will accrue to Canada without any corresponding advantages to the United States. It selects out of all classes of the community the farmer, and deprives him alone of the protection accorded to all other classes of producers. It compels him to produce for a free-trade market and forces him to buy in a protected market. It is in the interest of the foreigner and against the American. At the opening session of the Canadian Parliament, Mr. Fielding, speaking for the Government, said: "It is the reciprocity agreement of 1854 over again, with comparatively little change. It promises prosperity to the people of Canada, and this House would make a grave mistake if it should refuse to take advantage of it."

No general trade relations, reciprocal or not, are proposed, save as to farm products. The dutiable articles compassed by the proposition have no more relation to reciprocity than they have to the free list, and the whole is perniciously objectionable because it cannot but be a paralyzing blow at our own farm industry, leaving the farm produce unprotected, while farm machinery and all the things the farmer must buy remain protected. It simply provides for putting the same articles in trade competition on an even basis in *our* country. It simply lets *in,* to our market of 92,000,000 people, everything which Canada can possibly produce, and to just the extent that with cheaper land, cheaper wages, cheaper modes of living, she can undersell our producers, without in return letting one item of American production into Canada, for the obvious reasons that Canada already has an over production of the same articles to get rid of, that she has but seven or eight million consumers, largely living a much simpler life than we, and that she is and proposes to remain loyally bound by natural home ties and by preferential duties and otherwise to give her trade, as far as possible, to Great Britain and her kindred provinces. Canada already gives us the lion's share of her trade because it is already to her advantage to do so, and this abnormal reciprocity proposition will not increase it one atom. She buys of us what she can buy here cheaper than anywhere else, and she always will. What she *wants* and what we have been buncoed by the Canadian representatives into proposing to give her in this trade treaty is the right to *sell* here, without restraint, whenever on account of cheaper land, cheaper wages, and cheaper methods of living she can undersell our own farmers, reducing the price of all of our common productions to the common figure of the one who can produce the lowest.

When an article produced in one country is found to be less in value at home than in the other country, it will go there —but *not* for reciprocal exchange. It is simply reaching out for the market where the highest price obtains, and it will surely bring down the proper market price all around to the American farmer, wherever he exists. A trade agreement which does not secure a market abroad for American articles, but which simply opens a door for foreign articles of the same kind to come in to our market, which is itself capable of meeting all demands, is not reciprocity. It is not of any possible advantage, but of serious menace to America, especially when it strikes at the root of all prosperity, the farm producers.

The agitation has gained favor in America on account of the increasing cost of living, and the cry which has gone out, which many who have not considered the matter seriously believe, that the cost of living will be lowered in

America, because this trade compact with Canada will lower the price of grain and cattle and sheep and hogs and poultry. It *will* accomplish the lowering of the profits of the American farmer and it will increase the market of the Canadian farmer, but *it will not lower the cost of living to the American consumer one atom.* It will do precisely the opposite. It will discourage agriculture where we have been endeavoring to encourage it, and for the last few years have succeeded in this. Our own productions will diminish as Canada's grow. Soon we shall be absolutely dependent upon Canada, which is what she desires, and in natural result the prices will go up instead of down and Canada will reap all the benefit.

It is all very well to talk about enlarging the market, the proximity and the natural unity of the two countries, and all that, but Canada is not one with us and does not propose to be. If it were annexation instead of free trade, many of the sentimental arguments would be good, and undoubtedly mutual prosperity would eventually follow. But it is not annexation. Canada is a foreign nation and by all arguments and indications, proposes to remain so. Canada simply wants to grow rich at our expense, remaining an English province, and we are trying to help her. Assuredly the arrangement was not entered into to benefit American agriculture. Even the one professed benefit, lowering the cost of living, supposing that it did result from the treaty, would be obtained at the cost of depressing American farm products by competition with Canadian products.

At present wheat is dutiable at 25 cents a bushel. This it is proposed to put on the free list, while flour is retained among the protected products. Last year Canada exported nearly fifty million bushels of wheat. Are we hoping to get some Canadian market for American wheat by taking off the duty of 25 cents a bushel? If we were enacting a law for the benefit of consumers, the laboring man, the masses of the people in this country, why should we not put flour instead on the free list? Nothing is gained by admitting Canadian wheat free, except putting it in competition with our farmers' product, and the only result will be to reduce the price to the farmer, whether his wheat is consumed in this country or exported. The average difference in the price of Canadian and American wheat, on the border line, is now something over 16 cents a bushel, and to admit that wheat to our elevators and mills free of duty will absolutely reduce in about that amount the price which our farmers can obtain.

To say that the price of wheat is fixt in the world's market, fixt in London, according to the law of supply and demand, is an utter fallacy when applied to the producer—the farmer. The price which the farmer receives is a local price, fixt by local conditions. The farmer cannot store and hold his crop. He sells it to purchasing agents—sells it according to the local market. After that, for the great storage elevators, and for the great exporters, the world's price obtains, and is undoubtedly *fixt in the world's market.* This reciprocity measure, as to wheat, simply means that Canadian wheat shall be admitted free to the American market to lower the price obtained by the farmer; while flour being retained on the protected list and both wheat and flour in bulk being regulated in price by the world's market, it means that the ultimate consumer, the bread eater, will pay precisely the same as before. The removal of the duty will enrich the Canadian farmer thru a better market, will enrich the middle-man thru the local conditions of competition, enrich the great flouring mills thru forced reduction in local prices, while the world's prices remain, but will not lessen the cost of living to the consumer one atom. The same is true of all farm products. Why, the simple agitation of the question, when the bill was presented to Congress, caused the price of wheat in Minneapolis to drop from $1.06½ a bushel to 96 and 98 cents—a direct loss to the farmer who had to sell at that time of 8 to 10 cents a bushel. But it did not change the export price of wheat or the retail price of flour.

The proposition also includes putting all animals on the free list. Cattle, hogs, sheep, are not raw material to the farmer. They are his finished product. Those items are on the free list, and the next moment we find meats on the pro-

tected list—a position which cannot be justified with the good thinking people of this land. It is simply protecting the great packing houses of this country at the expense of American farmers, without one benefit accruing to the general public. There is no mistake about that. We would surrender "body, soul and breeches" to Canada, and tell the public that it is reciprocity and will reduce the cost of living.

The proposition does not reduce the duty on farm machinery coming from Canada, in a single item—not a fraction of a penny; but it does secure to the Canadian, and to the International Harvester Company and other manufacturers of farm machinery in this country, a lower rate of duty on such machinery made in the United States and going into Canada. In the name of common sense, in what way is that provision to benefit the American public, except by making the Harvester Company richer—and the farmer poorer? It strengthens concentrated wealth and weakens the backbone of the country. Is that reciprocity? Go to the United States Treasury and look up statistics and you will find but one country on God's green earth levying a duty upon our farm machinery, if they have farm machinery coming in to our markets. Farm machinery is now brought in free from all countries of the world *except from Canada,* and that duty, 15 per cent. ad valorem, remains unchanged in the "reciprocity" pact.

Wool is left dutiable, but sheep are on the free list. By what means are farmers of Canada to be prevented from driving or shipping their sheep over the border before shearing them? Then the wool, too, comes in free—and the sheep can be driven back if so desired. Cattle, hogs, and sheep are all on the free list if brought in alive. Otherwise they are meat, and must pay duty. Wheat can be brought over free, but flour is dutiable. Is that for the benefit of the consumer? Will that reduce the cost of living, or will it instead increase the profits of the already well-protected industries just beyond the farmers?

Why, the man who makes statements about this trade agreement lowering the cost of living and still maintaining the price of labor, either is not well informed, or is not sincere. It is a physical impossibility. It is political buncombe, pure and simple. The whole proposition is absolutely against the interests of the American people and wholly in the interest of Canada.

We have one other instance of reciprocity from which we can gather experience, but of a much less drastic character and far less dangerous and destructive. We passed a so-called reciprocity measure with Cuba. It did not put any competitive articles on the free list, but it reduced the rates of duty on Cuban goods coming into this country 20 per cent. below that collected on the same class of goods coming from other countries, and Cuba, in return, gave us a 20 per cent. better rate on our goods than she gave to any other country. Now, the result: The year before the adoption of the Cuban reciprocity treaty the balance of trade against us with Cuba was $8,071,084. Those figures have been steadily growing till in the calendar year 1910, after only eight years operation, the balance of trade against the United States with Cuba was $70,043,000. We reduced the duty on raw sugar coming from Cuba 20 per cent. below the rates of the Dingley law; but did that lower the price of sugar to the consumer? No! Statistics from that day to this show that the price of *raw* sugar in New York has always been *lower* than in London, but that the price of *granulated* sugar has always been *higher* in New York than it has been in London. And it has always been higher since the adoption of that law to the present time than it was for a decade before that reciprocity pact was passed. Since the passage of that law the United States Treasury has been deprived of $77,000,000 duty on Cuban sugar. The Cubans have reaped but a slight advantage from it. Only one interest in the world was vitally benefited by the Cuban reciprocity pact. The great American sugar refining companies have reaped the whole benefit. This Canadian reciprocity measure is more drastic, more one-sided, more dangerous to American interests and no less sinister.

Last year, of American manufactures and agricultural products we sold abroad over $1,800,000,000 worth. We pur-

chased from the whole world about $1,500,000,000 worth. There was a balance of trade in our favor of $301,000,000. Now comes a fact in connection with this new trade measure which is worth putting down in the memorandum book; $120,816,000 of that $300,000,000 balance of trade in our favor was from our trade with Canada—trade with Canada under established conditions, and simply because we could supply her for less than she could obtain the same goods elsewhere. We sold Canada last year $215,000,000 worth of our goods, and bought from Canada $95,000,000.

While we face the dire necessity of increasing to the limit our Federal revenues to meet our colossal expenditures, can we afford to instigate free trade relations which will cost us such a trade balance—a balance seriously needed to maintain our gold reserve—with no possibility before the measure but of enriching Canada and a few money interests in America, at the expense of American agriculture? Can we afford it?

WASHINGTON, D. C.

A Song of Spring

BY HARRY KEMP

WHEN the world grows fair and everywhere soft hands unwrinkle the brow of care,
And the leafless wood is all abud, and life is good, and life is good——
When the grasses thrive and the little birds wive and a man feels glad that he's alive——
When the warm winds blow and the dirt-streaked snow has joined the river long ago,
And the ships catch gales in bellying sails and the long freights creep o'er shimmering rails——
Oh! then I fare on a tryst—somewhere—and my heart's as light as a leaf in the air.
With a wanton will I climb the hill and pass by the many-windowed mill,
Whence faces peer as pale as fear in this, the glorious spring o' the year . . .
Oh! the hearts that yearn and the brains that burn and the wheels that turn, and turn, and turn!
Oh! don't they know that the south winds blow, that the small birds sing and the flowers grow?
Tho the world's now new, with face askew a hunched-over shoemaker hammers a shoe;
Tho the catbirds scold, still men grow old in the bitter battle for place and gold:
While the wild geese fly with a questing cry in gray triangles across the sky,
Still mankind plods and labors and nods defiance into the face of the gods——
To its task doth cling when everything is toucht by the miracle of spring.
Where the plains roll free, or the winged fish flee o'er shifting hillocks of heaving sea——
Where silences pray and the forest-way doth make a green night during day
I go.——Like a priest of a creed deceased in an ancient temple of the East,
Leaving the man who'd liefer scan an olden philosophic plan;
Who'd rather look for a leafy nook—and then shut up his soul in a book;
Had rather invade a ledger of trade and figure the daily profit made——
For, as for me, I'd sooner be a heap of bones in a fathomless sea
Than thus be sold to the curse of gold or a book men read because it's old!

LAWRENCE, KAN.

Porfirio Diaz

Francisco I. Madero

The Mexican Insurrection

by Chester T. Crowell

[Mr. Crowell is a member of the staff of *The Statesman,* of Austin, Texas. He has undergone over two years' service in Mexico City as a journalist and was a member of the party of thirty-five American and Canadian newspaper and magazine men who toured Mexico last September as the guests of the Mexican Government. Except for the two years spent in Mexico, Mr. Crowell has lived all his life in Texas. He is thoroly informed in regard to the present crisis and has talked with most of the representatives of the insurrection who have crossed the border. We think our readers will say that no fairer or more informing article on present conditions and their significance has appeared.—EDITOR.]

IN its daily dealings with the press of the world, the Mexican Government has never adopted an attitude likely to win for it any great amount of consideration in time of difficulty. The attitude has not been hostile, but neither has it been very friendly. One of the first things the Mexican Government did in the present difficulty in that country was to commandeer the Associated Press wire when there was no very great need for such action. As a result, every rumor that could be gathered along the border immediately assumed a news value. Add to these rumors the fact that the American people do not know a great deal about Mexico and it is very easy to understand why a disturbance that has never assumed very dangerous proportions has been deemed likely to end the present government of Mexico.

Reports of engagements between Mexican troops and the insurrectos have come almost daily for weeks, and it is only natural that the American people have turned their attention toward Mexico to wonder whether or not the billions of dollars of foreign gold invested in that country are safe. But if one will examine the reports with reference to the number of troops engaged in these little battles and with reference to the size of the villages in or near which the battles occur it must be apparent that these fights are not going to bring the Mexican Government to failure even should the revolutionists win most of them, as, indeed, they seem to be doing. In reading the news from Mexico it must be kept in mind that Mexico has a population of 18,000,000 persons, which is more than that of any other Latin-American country with the exception of Brazil. Also it must be kept in mind that these battles are for the most part in the State of Chihuahua. Others are in Yucatan and Lower California. Now the Mexican Government could very well donate to the revolutionists the entire State of Chihuahua and the entire State of Yucatan and quite a bit of other territory in which the revolutionists are strong and still be in no great danger.

Chihuahua is the largest Mexican State. A map will probably show Chihuahua and Texas side by side and this will give an indication of the size of Chihuahua. The area of Chihuahua is 233-094 square kilometers, and its population is 327,784. Now, in this last sentence

lies the explanation of the difficulty of bringing the revolution to a close. There is a territory that compares with European nations in size and it has a scanty little population of 327,784 scattered over its vast expanse. The country is rough. Much of it is mountainous. The principal business of the people is mining and cattle raising. There is considerable agriculture, but the agricultural methods are crude and the products, considering the number of farmers, very small. Crops have not been good in Northern Mexico for several years and this has added to the ill-feeling of the people. There was a so-called revolution in that State in 1907. I was well acquainted with all the conditions at the time and in close contact with the affair from start to close. I have always diagnosed that revolution as the result of a shortage in the corn and bean crop. There was nothing else to make out of it.

Mexico has a standing army of 35,000 men. The army is fairly well trained and well supplied with artillery and good rifles. The officers are for the most part efficient, and there is every reason to believe that under even fair conditions they can defeat an equal number of rebels. But they are 1,000 miles from the City of Mexico when fighting in the mountains of Chihuahua. A single line of railroad winds thru the weary waste of hills to bring them supplies and reinforcements. It is impossible to guard every mile of that road. It is not any indication that the rebels are going to win when they manage to find an unprotected bridge somewhere along that vast expanse of territory and blow it up. It will take time to put down this revolution, but it will be put down. It may bring about almost a war of extermination to accomplish peace.

But the populous part of Mexico is the southern central part. If the revolutionists had taken Vera Cruz and started along the route of the Mexican Railway toward the City of Mexico there would be every reason for alarm. If they had

REVOLUTIONISTS AT CASAS GRANDES.

taken Guadalajara or Puebla or some of the cities in that part of Mexico there would be reason for alarm, but they cannot defeat the present Government of Mexico by capturing the isolated little mining town of Chihuahua, which has a population of only about 40,000. It would not mean very much if they did take Chihuahua, and especially it will not mean anything if they take Chihuahua by starvation, because that is fairly easy and does not give the rebels anything when they have taken the city.

The most serious aspect of this entire revolution is the tendency of Americans to cross the border and fight with the revolutionists. If this can continue for one year there will be enough American adventurers in Mexico to overthrow the Government. There are certainly 100,000 men in the United States who for some reason or lack of reason will fight in a revolutionist army when it is so near. One hundred thousand such fighters can take Mexico, or at least inflict damage that will not be repaired in less than half a century. They are the bravest kind of soldiers. They fight with all the abandon of recklessness. They have everything to win and nothing to lose because they don't value their lives. They are the real danger at present and it is to be regretted that the American Government was so slow in putting obstacles in the way of their crossing the border.

The Americans who cross to fight in this revolution don't understand conditions in Mexico. They don't know what they are fighting for, and a great many of them don't care. All they ask is an opportunity to fight. If they should win they couldn't organize a government. Just why an American should wish to fight in the revolutionist army in Mexico is difficult for one who has lived in Mexico to understand. The Mexican Government has always been fair to Americans. It has encouraged the investment of American capital and has given American capital fair protection. Americans are always treated with consideration and even generosity. Those who have occasionally suffered unjustly have suffered at the hands of some ignorant district or State official and not at the hands of the Federal Government. One faction, and probably it is the largest faction in the present revolutionary move-

ment, has as its campaign cry "Mexico for Mexicans." These people are opposed to the extension of foreign holdings in Mexico. They want the foreign influence in all things to be less. They are demanding something which is utterly impossible. The Mexican Government by taking over the railroads and favoring Mexican employees and opening schools and encouraging industries which require skilled labor has done much to raise the standard of Mexican workmen, and to this extent has aided the "Mexico for Mexicans" propaganda. Until Mexicans are able to develop their country and compete successfully with the foreigners they cannot expect to drive out the foreigners.

Moreover, who knows what the revolutionists promise? What do they want to do? What is their platform? It is not a matter of general information. This is no movement to rally around some principle of government and fight for it. The present revolution is caused by at least half a hundred different grievances. Many of those who are fighting are opposed to their local governments. Others are opposed to General Diaz, and always have been. Others thought Francisco I. Madero was not treated right when he ran for President. Others think General Diaz should have retired from the Presidency a few years ago. Others are little better than brigands and welcome the opportunity for loot. Among the leaders, however, are many excellent men who think there is only one way to bring about the greater development of Mexico to a republic of the best sort, and that is by a revolution which shall put the old regime out of office.

About the greatest error of the Mexican Government was its slowness in bringing about real elections for Governors. Some experiments in State elections were made at the suggestion of General Diaz, and they were not very successful. There was at the time grave

reason to fear that heated political campaigns would result in disorder and loose all the vials of purposeless enthusiasm that leads not to better government but to political feuds. Even so, in the light of after events it is easy to say it would have been better if freer use of the ballot had been encouraged. But would the new faction give freer use of the ballot if it were in power? And if it did so would the results be good? These are the great unanswerable questions. In short, could the revolutionists if they were in power do any better than the present Government is doing? There is serious reason to doubt it.

Francisco I. Madero is a well educated man, imbued with American ideas. He is progressive. But he is not a strong man. He is very little more than five feet tall; has a weak voice, a nervous manner, and does not act nor look the part of a great leader. He is not a military man and the conduct of his present military campaign in Mexico plainly shows it. The wealth of which he is possessed he did not accumulate. There is not a great deal to recommend Dr. Madero beyond the fact that he is a scholar and a gentleman and is sincere and loves his country and believes he is doing a patriotic duty. The same can be said for General Diaz and his Cabinet.

But if the revolutionists win they must first take some of the great seaports. They must capture the City of Mexico with its 400,000 population. They must fight battles in the open in which armies of about 50,000 men will be engaged. Mexico is unlike the other Latin-American republics. A revolution in Mexico must result in great battles and great military campaigns. In this connection it is not amiss to call attention to the

fact that if an international commission had been named to pick out the country where the most international complications would result from internal disturbances it would probably have chosen Mexico. Every civilized nation under the sun is represented in Mexico. Its foreign colonies speak every printed language. The street car system of Torreon is owned by Chinese. Mexico is a great conglomeration of foreign investments. The Mexicans cannot very well turn artillery upon a Mexican city without shooting holes in some building owned by an American life insurance company. Blowing up railroad bridges in Mexico is shooting into the safety deposit vaults of New York City and Paris. One is almost tempted after becoming acquainted with business and investment in Mexico to say that a real revolution there is simply impossible. It would bring intervention and endless difficulty, all of which apparently would lead nowhere.

So serious, however, has been the trouble in dealing with the malcontents in that country that the Mexican Government is inclined to try to outline government policies calculated to bring about peace. The attitude of General Diaz toward a revolution is fairly well known. Few persons who know the doughty old warrior will pay any attention to discussion of plans for him to treat with the revolutionists looking toward arbitration of the difficulties. He will want to get rid of the revolution first and its causes afterward. General Diaz is of the sort that doesn't parley or arbitrate in a situation like this. The war is going to be bitter, as internecine war always it.

"DINNER IS SERVED."
At the Camp of the Fifteenth Infantry, U. S. A., in Texas.

A man like José Yves Limantour, Minister of Finance, can do a great deal for his country in a situation such as this and he is going to do his best. He will assist in the outlining of more liberal and progressive policies that will be likely to do much toward satisfying the people in Mexico. In fact, there is only one good reason why Señor Limantour should not be President of Mexico and that is that the people do not seem to

want him. He is not popular in spite of the fact that he is an honest, patriotic and able man in all governmental affairs and a genius of finance. He is democratic and loves the common people of Mexico much better than they love him. He will undoubtedly do more than any other man to tide over this unfortunate affair and bring Mexico together again as the disturbance draws to a close.

This decade is one of transition for Mexico. Only a few years ago common laborers received less than one peso (50 cents) a day. Today they receive between one and two pesos a day. There is demand for skilled labor. The Mexican Electric Tramways Company of the City of Mexico (a Canadian corporation) employs Mexicans to manufacture cars in its shops in the City of Mexico. Mexican electricians and other skilled workers are gradually appearing to take an active part in the material development of the nation. These men come into close touch with the foreigners and particularly Americans. While these well-fed and fairly prosperous Mexican workmen are not disturbers to any considerable extent it is thru them that knowledge filters among the mass of the people and gradually the realization has become keen that Mexico is not as truly a republic as it might be. Ultimately this will all be for the best, but for the present it causes a certain undercurrent of dissatisfaction. In other words, the very forces which are working for the ultimate best interests of the nation have for a few years been creating dissatisfaction.

There is no reason to be pessimistic about the future of Mexico. The people are becoming more prosperous and better informed every year. It might not be too much to say that this revolution will teach the powers that be a lesson they must learn—a lesson to the effect that history is made rapidly in these days of the telegraph and that the people have made more progress in the last five years than they made during the preceding fifteen years. Such are the inducements the country has to offer and such is the enterprise of Americans that the revolution cannot very long delay the active development of Mexican lands, and while the disturbance is greater than any Mexico has experienced for a great many years it is not sufficiently serious to justify predictions of the end of the regime of Porfirio Diaz.

AUSTIN, TEXAS.

Mexico and International Law

BY AMOS S. HERSHEY, Ph.D.

[Professor Hershey holds the chair of Political Science and International Law in Indiana University. He has written much on international matters and his exhaustive volume, "The International Law and Diplomacy of the Russo-Japanese War," is considered the authority on the subject.—EDITOR.]

WHILE awaiting an official explanation of the movement of troops to the Mexican border, it may be profitable to consider the worth of some of the unofficial or semi-official explanations of these "maneuvers."

We were told, for example, by the Associated Press correspondent who accompanied the President on his journey to the golf links of Augusta:

"The United States had determined that the revolution in the Republic to the south must end. The American troops have been sent to form a solid military wall along the Rio Grande to stop filibustering and to see that there is no further smuggling of arms and men across the international boundary."

From another "unofficial but authoritative" statement we learn:

"No invasion of Mexican territory is now contemplated by the United States; but should the Mexican authorities prove unable within a reasonable period, possibly six months or longer, to stamp out warfare, the services of the army would doubtless be offered for purposes of pacification."

Secretary Dickinson has told us that the troops were sent "in order to maintain our neutrality laws." But he gives us the somewhat comforting assurance that "there can be no excuse for intervention unless the Mexican Government were negligent in protecting persons and property." He adds: "There are no

conditions existing now that would warrant any such action on our part."

But Senator Burton tells us that the United States will probably intervene "if the insurrectos captured the city of Chihuahua." However, it is reported that the President said emphatically, "that no move toward intervention would be made by the Administration unless it is directed expressly by Congress after the latter is informed of all the facts."

Now let us see how these explanations stand the test of the Law of Nations. The merest tyro in international law knows that neither the Law of Nations nor our neutrality laws prohibit the supply of arms and ammunition either to belligerents or insurgents. There should be no need of smuggling. The trade may be carried on openly. But anything in the nature of an organized military expedition (filibustering) and the use of a port or a portion of our territory as a regular and continuous base of supplies for military operations is forbidden.

Neither is enlistment prohibited either by our neutrality laws or the Law of Nations. Our neutrality laws do prohibit foreign enlistment or the acceptance of a foreign commission within the territory of the United States. They also prohibit any one from hiring any person to enlist or from hiring another to go beyond the jurisdiction of the United States with intent to be enlisted. But it was held in the case of United States v. Kazinski (2 Sprague, 7) that it would not be a violation of our neutrality laws merely to leave this country with intent to enlist. On the other hand, the levying or recruiting of troops within the jurisdiction of the United States for foreign belligerent service would undoubtedly be a violation of international law

Is it likely that an army of 20,000 men is needed to prevent recruiting and filibustering on our territory?

Much has been made of the supposed duty of our Government to protect American life and property, the safety of which, it is assumed, is endangered by revolutionary movements in Mexico; and the Monroe Doctrine has been invoked as evidence that we are responsible for foreign investments as well.

No overt acts indicating the actual destruction of American life and property have thus far been alleged—a remarkable proof of forbearance or self restraint on the part of the Mexican people under the circumstances. Imagine a Japanese or even a British army threatening our frontier during a time of insurrection or civil war! Would Americans be likely to show a similar degree of self-control?

To secure an adequate or absolute protection of property interests in times like these we should have to resort to forcible intervention. And as Señor Limantour has well said, this means invasion, occupation, war. It is undoubtedly the right and duty of a government to use its best offices and to bring to bear all the influence it can command in a peaceable way to secure adequate protection of the lives and property of its nationals during times of riot, insurrection, or civil war.

But even at such times foreigners who have suffered injury must ordinarily, in the first instance, have recourse to the courts or local authorities of the place or district in which they are domiciled. The general rule of international law is that "a sovereign is not ordinarily responsible to alien residents for injuries they receive on his territory from belligerent action, or from insurgents whom he could not control." The law of necessity or the physical inability to furnish adequate protection generally absolves governments from responsibility in such cases.

> "Foreigners are not entitled to greater privileges or immunities than other inhabitants of the insurrectionary districts. . . . By voluntarily remaining in a country in a state of civil war they must be held to have been willing to accept the risks as well as the advantages of that domicile."

These principles have been repeatedly enunciated by leading American and European statesmen, and they have the almost unanimous sanction of leading authorities on international law. Several exceptions must, however, be made to these general principles. Indemnity would seem to be due in the following cases: 1. Where the acts complained of have been directed against foreigners because they are foreigners. 2. Where the injuries result from violations of the laws or treaties of the country in which they have been sustained. 3. In case of a serious violation of inter-

national law, more particularly of the rules of civilized warfare. 4. In cases of an evident denial, or of a palpable violation of justice, or of undue discrimination against foreigners on the part of the authorities.

But it should be noted that even in these cases, the proper remedy is that of diplomatic interposition rather than of forcible intervention. Only after all amicable or peaceable modes of redress (including that of arbitration) have been refused may the use of force be regarded as permissible. *Mere danger of injury to the lives or property of foreigners affords no ground for intervention* in any case.

Nor does the Monroe Doctrine give us good ground for intervention. In its existing form, that Doctrine may be defined as the prohibition of any further acquisition, colonization, or permanent occupation of American territory by any European (or Asiatic) Power. It has frequently been claimed of late years that the Monroe Doctrine involves duties and responsibilities as well as rights, more especially that it imposes upon us a certain responsibility for the good behavior (by which is generally meant good financial behavior) of Latin-American States.

It may be admitted that this Doctrine does impose upon us a certain measure of responsibility, viz.—that of seeing to it that there is justice and fair-dealing in the relations (financial and otherwise) between European and American States. But it does not impose upon us the duty of seeing to it that Shylock receives his pound of flesh, that either foreign or American syndicates be "protected" from loss on their investments (whether watered or legitimate). The Law of Nations imposes no such obligation, and our responsibilities cannot possibly extend beyond the requirements of international law.

Public loans and investments which have been guaranteed by the Mexican Government, i. e., those based upon contract, are provided for by the Conventional Law of Nations. The Porter Convention adopted by the Second Hague Peace Conference of 1907 expressly declares the use of force for the collection of contract debts illegitimate unless there has been a refusal to arbitrate or failure to submit to an arbitral award. There is no good reason why the same principle should not be applied to all claims of a pecuniary nature.

There is one issue between the United States and Mexico which is almost certain to arise, viz.—whether, in view of the suspension of constitutional guarantees of personal liberties, the Mexican authorities have the right of summary execution of Americans taken in arms against their Government. Provided there be no discrimination against them, the rights of such adventurers would seem to depend upon the question whether a status of insurgency or belligerency of the revolutionists has been recognized by our Government. It is to be hoped that our State Department has learned by experience and will show more wisdom in dealing with this class of cases than it did in the Nicaraguan affair.

There is another aspect of this threatened intervention in Mexican affairs which does not appear to have been duly considered, viz.—its possible or probable effect upon our reputation in the world at large, more especially in Latin America.

In spite of our professions in favor of peace, we are an object of fear and suspicion to the nations. How do our professions as a peace Power square with our practice of Imperialism? Would an invasion of Mexico assist the cause of Canadian reciprocity? What would be its effect upon the cultivation of closer commercial and political relations with the States of South America? What will become of the field of co-operation with these countries sown by Secretary Blaine and so brilliantly cultivated by Secretary Root? In this connection it may be well to recall a portion of a speech delivered by Mr. Root in Buenos Ayres on August 17, 1906:

"The United States has never deemed it to be suitable that she should use her army and navy for the collection of ordinary contract debts of foreign Governments to her citizens. For more than a century the State Department . . . has refused to take such action, and that has become the settled policy of our country. We deem it to be inconsistent with that respect for the sovereignty of weaker Powers which is essential to their protection against the aggression of the strong. We deem the

use of force for the collection of ordinary contract debts to be an invitation to abuses in their necessary results far worse, far more baneful to humanity than that the debts contracted by any nation should go unpaid. We consider that the use of the army and navy of a great Power to compel a weaker Power to answer to a contract with a private individual is both an invitation to speculation upon the necessities of weak and struggling countries and an infringement upon the soverignty of those countries, and we are now, as we have been, opposed to it; and we believe that, perhaps not today nor tomorrow, but thru the slow and certain process of the future, the world will come to the same opinion."

It may be noted that Secretary Root speaks of the forcible collection of *contract* debts. The case for the forcible collection of ordinary debts would be still weaker.

BLOOMINGTON, IND.

The Death Sign

BY SYDNEY REID

[This article has unusual interest at the moment when the trial of Camorrists at Viterbo, in Southern Italy, furnishes the most picturesque and far from the least important part of the day's and week's news. Mr. Reid has studied the American end of the problem of Italian crime; and his testimony as to police conditions is of particular interest at a time when the charge that a "crime wave" has overwhelmed New York, and that the police force is totally demoralized, is once more raised.—EDITOR.]

"THIS woman would have told her story were it not that she was reached by some of the Black Hand and told that she would be killed in open court. Consequently she would not reveal anything. She knew what it meant. She knew that the gang of which Pattenza is leader would have killed her in open court."

These are not the words of some wild sensationalist, nor do they relate to some far off, barbarous country. They were uttered from the bench of the County Court of Kings County (New York City), by County Judge Lewis Fawcett, while trying the Black Hand kidnappers Maria Rappa and Stanislas Pattenza, who had been caught red-handed with stolen children, Giuseppe Longo and Michael Rizzo, in their possession. Both prisoners were promptly found guilty and just as promptly given the utmost rigor of the law—each sentenced to twenty-five years imprisonment at hard labor.

During Pattenza's trial on December 22, District Attorney Clarke asked him if he knew the Black Hand. Previous to this question he had been quite jauntily denying any knowledge of the kidnapping, but at the name of the Black Hand he lost his smile, and answered in a low, hoarse voice:

"I knew it before I could even talk. Everybody knows the Black Hand in Italy. Children are brought up to dread it. I was. The Black Hand is everywhere. You can't get away from it. I came to America to escape it. I have always lived in dread of it. It is a society of bad men, who make their living without working."

"Show your hands to the jury," said Mr. Clarke.

Pattenza protested, but on advice of his counsel did show his hands. They were the soft hands of a man who did not work.

In Greater New York there are over 500,000 Italians, of whom only 3 per cent. are naturalized citizens of the United States. The others are huddled into swarming colonies, Sicilians in one place, Calabrians in another, Neapolitans in another, and so on. As the Italian-American Civic League recently put it in a memorial to the Acting Mayor:

"By far the largest part of the Italians of this city have lived a life of their own almost entirely separate from the American environment. This very fact is the real cause of a number of evils peculiar to the Italian population and fostered by the ignorance of the language and institutions of the country, which is unfortunately so common among the Italian mass."

In each of the fifty Italian colonies of Greater New York there has been and is now a group of men who do no visible work and yet have plenty of money. The hard-working Italians with whom they

are surrounded know these men well and shrink from them. In describing them to the writer, County Judge Norman S. Dike, of Brooklyn, said: "They are not exactly bullies, in the American sense of the word; rather treacherous, sinister men, who, if offended, *may* do harm. They are well satisfied with themselves, and say: 'No, we do not work. Work does not agree with us. We have friends. they work and give us money. Why not?' It is these men, living as parasites upon their fellows, who are responsible for most of the crime among Italians. Their countrymen do not expose them, partly because they were fellow townsmen in Italy, but mostly because of fear. When one of the idlers is arrested charged with a serious offense, many of his townsmen make it a point of honor to assist him, others make it a point of honor to forget anything against him which they may know. Often the witness says: "Yes, I know him. I used to go to school with him in Italy." And he stops there.

An incident in the Caruso case proved to the writer how strong and widespread is this compulsion to silence concerning crime among Italians.

Enrico Caruso, the great singer, about three months ago received from the Black Hand letters threatening his life if he did not give up $15,000. Breaking all precedents, Caruso turned on the bandits, saying: "I will give nothing to these blackmailers except cold steel or bullets. Let them come on. I am prepared. They are a set of cowards."

Contrary to Italian ethics Caruso went to the police with the blackmailers' letters. A trap was set. Caruso deposited a dummy package in a lonely spot in Brooklyn, and detectives caught two men who came after it. These were Antonio Cincotti, of 117 Columbia street, Brooklyn, and Antonio Misiano, of 136 Columbia street, who have been tried and sent to hard labor imprisonment for many years.

One day, while the trial was on, Caruso sat in the office of the Kings County District Attorney, the observed of all observers. He is a strong man, with bold features, who looks as if he could take care of himself in a fight. He carried a sword cane and a gun, and was accompanied by a bodyguard of three stout and well-armed fellow countrymen. His face wore the gladsome smile of a child who feels that he has done something worthy of applause, and all the Americans in the office were smiling at him.

But a Sicilian was present—a man of education and culture, who has been in America for many years and who, at the time, was an American official especially charged with repressing crime in Kings County.

This man scowled and scowled right into the singer's eyes, and muttered low:

"The fool! He gives Italians a bad name. He ought to keep his ——— ——— mouth shut!"

He thought that the proper thing to do with Black Hand crime was to cover it over and deny that it existed. And when a cultured Italian takes such a position, what can be expected of the ignorant masses? Under the circumstances it is not so surprising that New York's magnificent police force, until recently, has seemed to be quite helpless in the face of Black Hand crime. Murders were committed in broad daylight on the open street, with scores looking on, and the spectators, a few minutes later, swept up in a police net, would all deny that they had seen anything. In one case the murderer sat on top of a fence and fired a sawed-off shotgun. A crowd of Italians had been attracted by a fight and pursuit, and at least a hundred must have seen who fired the fatal shot. The police caught the murderer under a bed, and detained and examined scores of those who must have been spectators. Not one of them would admit that he had actually seen the murder, and the only witness the police could produce at the trial was an Italian boy who had been arrested immediately after the shooting and kept from contact with any other Italians till he came into court.

Even this close confinement of a witness does not always preserve his or her memory. The "Death Sign" has been given in court under the nose of the unconscious American judge a score of times in the last two years, and the person to whom it was given has wilted immediately and refused to remember anything—the power of the court has

seemed so small and the power of the Black Hand so great.

How rampant the Black Hand has been of late is illustrated by an article published on September 4 in *The Times* of this city. That gave a list of crimes committed in and around New York by Italians during the month of August. There were thirty-one of these, including thirteen murders, five kidnappings, six blackmailing cases, four brutal assaults on girls, and three bomb explosions wrecking buildings and endangering the lives of hundreds. Two of the murdered were kidnapped children whose parents were unable to pay the money demanded. The bodies of the children were deposited near their homes. *The Times* writer describes the Black Handers as "ex-convicts of the Mafia and the Camorra, fierce medieval criminals, as conscienceless as so many wild beasts, and thoroly without fear because they hold their own lives as lightly as those of their victims, and laugh at the feeble laws by which the Government of the United States seeks to prevent their entrance into the country, and to restrain their depredations afterward."

The Times writer estimated the number of Black Handers in New York at 5,000, which is probably an overstatement. However, they must be very numerous, because when a band of the criminals has been captured, accomplices hire lawyers, procure bail, terrorize possible witnesses and prosecutors, and write threatening letters to American officials having to do with the trial. Then it has been found that these Italian criminals have their runways in the different American cities. The criminal wanted in New York for murder or some other atrocity dodges to New Orleans, Montreal, Pittsburgh, Cincinnati, Chicago or Buffalo, and tho he has never been there before, knows just where to go to find welcome, a refuge and a crowd of fellow countrymen ready to commit perjury to hold him safe.

Again, the fate of informers seems to bear out the statement of Pattenza, "The Black Hand is everywhere. You can't get away from it." Last November 13 Dominick Morone, a prosperous shoemaker, was shot to death at six o'clock in the evening at the corner of School and Cottage streets, Middletown, N. Y. The assassins were two Italians, strangers in Middletown, who ran away and made their escape. Two years ago Morone was an important witness against certain Italians in New York. The Black Hand threatened his life, and he expected assassination. Four attempts to murder him were made, while he dodged about the country after giving his evidence. And the Black Hand got him at last, as it finally caught and murdered more than a score of informers here during the past five years.

During the week that ended the year 1910, there were two bomb outrages in New York, and in each case the man against whom the explosion was directed had received Black Hand letters demanding money, with threats. The money had not been paid. The scenes of the explosions were:

December 27, new six-storied tenement, holding twenty families, at the corner of Fourteenth street and Avenue A. Salvatore Catalano, a prosperous merchant, who had been threatened, was evidently aimed at by the criminals. The bomb wrecked the hall and injured many tenants. The man who placed the bomb escaped.

December 29, five-story tenement, 524 East Thirteenth street; the apartment of Giorgio Sagano was wrecked and twenty other apartments damaged. Sagano had been receiving Black Hand letters demanding $2,000 on pain of being blown up. He destroyed the letters, paid no attention to the threats, and went on living in the rear of his grocery store. No arrest was made.

These bomb outrages were the last of a long series, all following disregarded Black Hand letters, and directed at particular individuals, but quite reckless of the hundreds of other Italians whom the bombs might kill or maim. So far the police have not caught any of the bomb wielders. Lieut. Tony Vachris, leader of the Italian squad of detectives, said concerning the explosion at Catalano's place: "These Black Hand bomb throwers manufacture their own bombs. They are made of paper, and the explosion tears them all to pieces. Therefore, it is impossible to get a clue from the bomb itself. Catalano had been receiving

threatening letters since February last. If he had turned them over to the police, it would have been been easier for us to get at the criminals."

All these things—systematic preparation for the defense of criminals in court, the establishment and maintenance of refuges for criminals in distant cities, successful pursuit and killing of informers, persistent blackmailing followed by bomb outrages where unsuccessful—argue that the criminals are organized and numerous.

Besides, there is the Petrosino list. Lieut. Petrosino, the great chief of New York's Italian detectives, was, in April, 1909, murdered in Palermo, Sicily, whither he had gone to obtain the records of Italian criminals who are now in this country. Previous to his death he had secured records of 700 criminals now here, and, after he was killed, Detectives Vachris and Crowley, following in his footsteps, went to Sicily, got Petrosino's list, and the records of 300 more Italian criminals now in America. These lists were given to New York Police Headquarters and no action taken upon them, tho the intention had been to round up all these criminal aliens and send them back where they belong.

The writer of this article made many efforts to interview Police Commissioner Baker on the subject, and the Commissioner, knowing what was wanted, persistently avoided the interview, and at last substituted Inspector McCafferty for himself. The Inspector, who was then at the head of the New York detectives, denied that there was any Black Hand, and pooh-poohed undetected crime in New York. Subordinates of the police chiefs were warned to give no information to reporters, and the situation in regard to Black Hand crime seemed utterly hopeless. If the police had been paid not to detect they could not have done it more successfully.

That was four months ago, and since then there has been a great change. Mayor Gaynor secured and installed as head of the New York police Commissioner Cropsey, a man of high ideals, keen mind, legal training and great activity. The Mayor also secured W. J. Flynn and put him in charge of the detective force. Flynn was for many years chief of the United States Secret Service in New York. He knows all about Black Handers, and has for years been capturing and breaking up their bands of counterfeiters. He is a big man and a great detective. Since his appointment he has done many things to make Black Handers unhappy. It was he who contrived the arrest of the kidnappers on the night of December 8, when they were caught in the Black Hand rendezvous in East Sixty-third street, with the Longo boy in their possession. Maria Rappa was in charge of the child. The neighborhood had long been notorious for kidnappers and blackmailers. The Scimeca boy, who was held captive by the bandits for ninety days, was found in this neighborhood—his father, Dr. Scimeca, as reported, having paid $5,000 for his release—and it was here also that the dead body of a kidnapped child was once discovered stuffed in a chimney.

The Rizzo boy was found later in another place in charge of Pattenza.

This was the first time that a band of Italian kidnappers had ever been captured in New York, and it gave great encouragement to friends of law and order. But it was only a partial triumph. "The Boss" got away, and the hue and cry after him has, as yet, had no successful results. That the kidnappers were terror-stricken in their turn was shown by the fact that another kidnapped child was returned soon after the raid. As a set-off against that, however, one of the band, in the Kings County Court, gave Maria Rappa the "Death Sign," and closed her mouth when she was on the point of confession. Apparently, therefore, the criminals are by no means conquered.

But there is another good sign, perhaps best of all. Italians themselves are coming to the aid of American authorities. After having for many years helped the criminals by denying knowledge of their crimes, by affording them refuge, and even by committing wholesale perjury in their behalf, Italians of the city have organized the Italian-American Civic League, led by bankers, merchants and professional men, who now join hands with other good citizens to stamp out criminality. Strong differences of opinion as to which particular

sort of Italians is responsible for the crimes have developed at the conferences of this body, Sicilians being hotly assailed and as hotly defending themselves; but there has been no difference of opinion in regard to the main point—that the crimes should cease and the criminals be deported.

On December 28, Flynn, with his Italian detectives, raided another supposed Black Hand headquarters at 212 Elizabeth street, taking eighteen prisoners on suspicion of being concerned in the kidnappings. One of these, Giacomo Crimi, is held on the evidence of six-year-old Joseph De Stefano as a man who had him when he was kidnapped last June.

Flynn is a worker. He already has his fine force in good shape and there is little doubt that he will solve New York's Black Hand difficulty. The thousand Italian criminals whose records are at police headquarters will be captured and sent back to Italy, and steps will be taken to see that other criminals do not come here.

The simple, efficacious way, and the way that Flynn approves, is to examine prospective emigrants in their own countries by means of staffs of American inspectors stationed at the consulates. Let the consulates issue certificates, and steamship lines be forbidden to carry passengers to America who do not possess these certificates, and let the photograph of each intending immigrant appear on his certificate. This would apply to all European countries, Great Britain and Germany as well as Italy. Inspection from the consulates would be easy and reliable, because in Europe local authorities keep close watch on their citizens.

The Black Handers are not superhuman. Nor are they above fear. Some of their greatest swaggerers collapse like empty bags when a judge sentences them to twenty years' imprisonment with hard labor. Lupo, "the Wolf," fainted. There are some cunning men among them, but the most are soulless brutes of the sort exactly described by Browning, in "The Ring and the Book," where the Pope tells of the "stout, tall, rough, bright-eyed, black-haired boys" whom Count Guido enlisted to aid him in his murders:

"'Murder me some three people, old and young
Ye never heard the names of—and be paid
So much.' And the whole four accede at once.
Demur? Do cattle bidden march or halt?
Is it some lingering habit, old fond faith
I, the lord o' the land, instruct them—birthright badge
Of feudal terror claims its slaves again?
Not so at all, thou noble human heart!
All is done purely for the pay—which earned,
And not forthcoming at the instant, makes
Religion heresy, and the lord o' the land
Fit subject for a murder in his turn.
The patron with cut throat and rifled purse,
Deposited i' the roadside ditch his due,
Naught hinders each good fellow trudging home
The heavier by a piece or two in poke,
And so with new zest to the common life,
Mattock and spade, plow tail and wagon-shaft,
Till some such other piece of luck betide."

The only failure in the poet's description is in the word "tall." Black Handers are not tall.

But the "Death Sign"—what is the "Death Sign"? The best authorities—Italian detectives—agree that it is the hand passed quickly across the throat as if cutting.

New York City.

Wanted—A Samaritan

BY BENJAMIN B. WARFIELD

Prone in the road he lay,
Wounded and sore bested;
Priests, Levites, passed that way,
And turned aside the head.
They were not hardened men
In human service slack:
His need was great: but then
His face, you see, was black.

Princeton Theological Seminary.

The Milk Problem

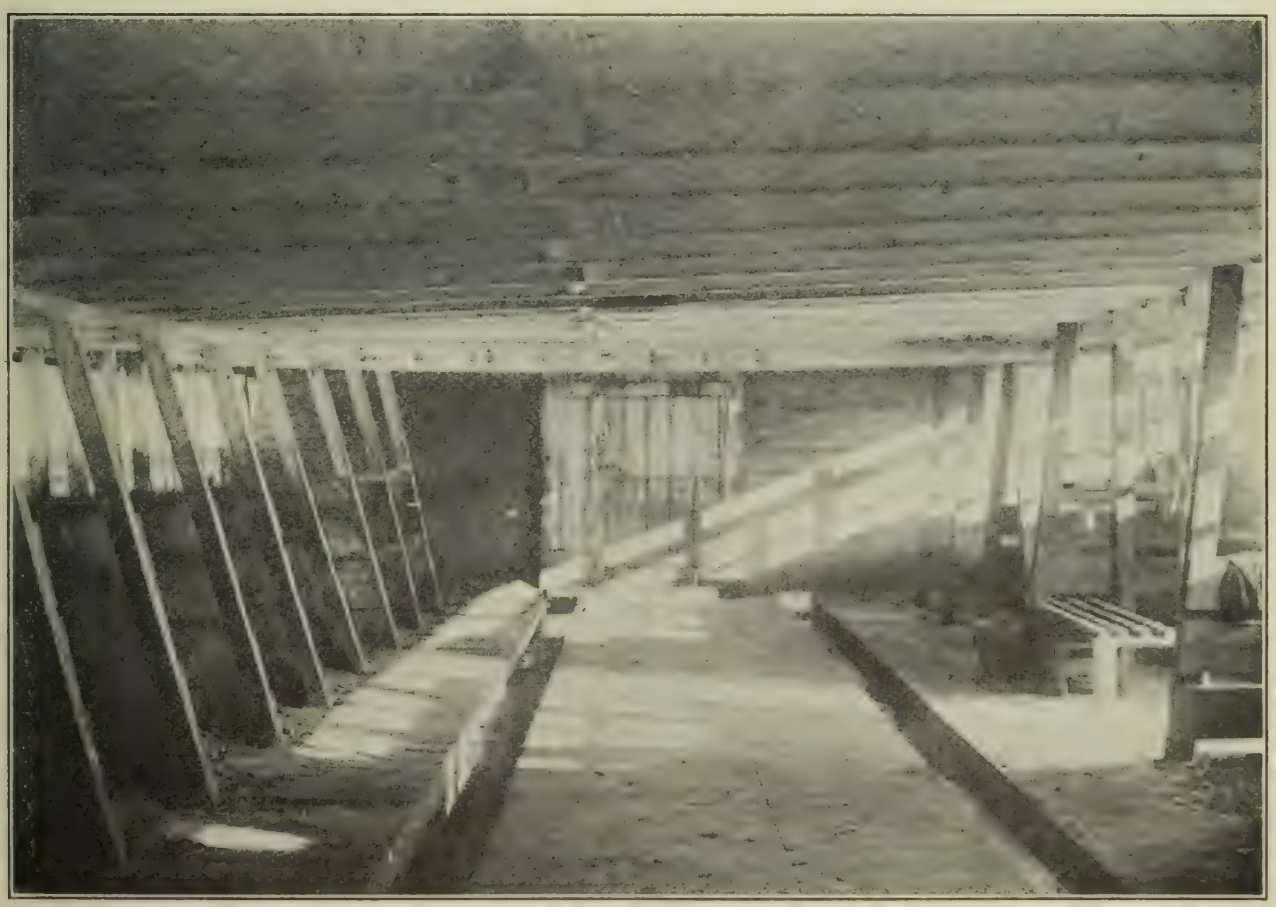
BY W. K. BRAINERD

Professor of Dairy Husbandry in the Virginia Polytechnic Institute.

THE milk problem has its origin in the development of centers of population. Under rural conditions where each family is supplied with a cow or milk is derived from that of a neighbor, the danger of contamination is at a minimum, and if infection takes place it is strictly localized. Milk produced under these conditions is usually consumed within twelve hours from the time of its production, and bacteria, which find a way into it, have comparatively little chance of development. Cows producing milk for rural sections seldom herd in large numbers, and are therefore comparatively free from contagious diseases.

In the production of milk for the city, conditions are radically different. Such production is commercialized. Large herds prevail. If a cow becomes diseased, not only does she subject a large number of other cows to this infection, but her milk is mixt with that of the herd, which is in turn often mixt by the distributor with that of many other herds, so that an infection, small at the beginning, may reach thousands of consumers. The holding of milk produced under these conditions from twenty-four to forty-eight hours, and cream from it sometimes a week or more, affords opportunity for a single germ to multiply into hundreds of thousands of its kind. The same conditions hold regarding the multiplication and distribution of germs which enter the milk at any stage of its production or subsequent handling.

While this problem is the direct result of the herding together of people in



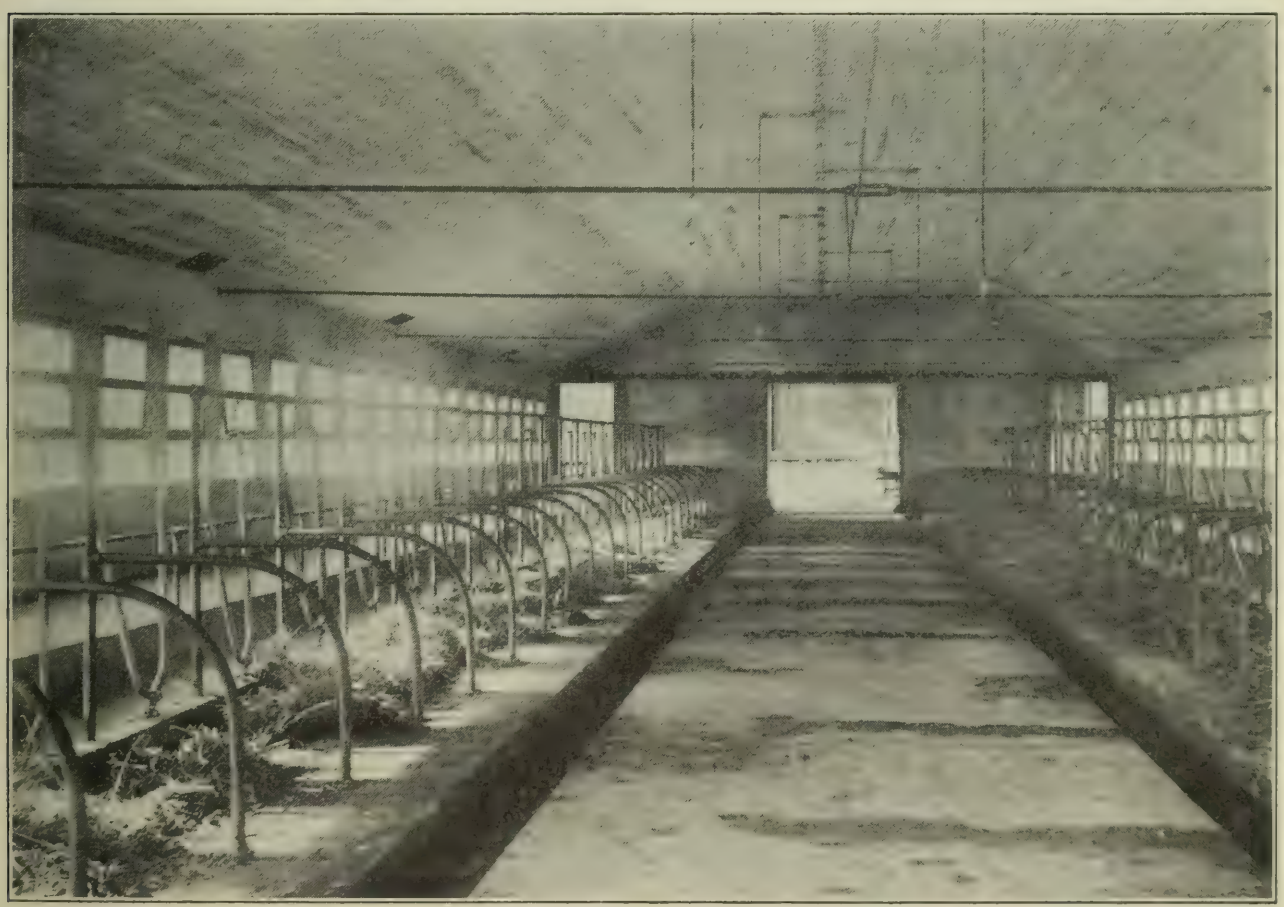
AN AVERAGE BARN AND EQUIPMENT.

The owner, Mr. B, is a man of limited mean, and produces milk for city consumption. He has crude conditions, as is shown by the other illustrations, but does most of his labor himself, and is neat and clean in his habits. His plant scored by approved methods: average for four months, 68.4. His bacterial count for these months averaged 8,062.

MR. B'S MILK ROOM (NOTE THE SCREENS).

MR. B'S BARN IS CRUDE, BUT CLEAN.

small areas, it concerns alike the producer, living generally in the country, and the consumer; the producer mainly from a financial standpoint, and the consumer from both a financial and a health standpoint. It can be dealt with most efficiently when all interests are properly weighed. In many cases the consumer has become enraged at the dangers encountered by his family thru the milk supply, and there is too much of a disposition upon the part of city health departments to treat the producer as a criminal who is striving to poison the public. On the other hand, the farmer has too frequently treated the dairy inspector as an enemy who is in every way striving to hurt his business. The public has been misinformed and incited to rash action in many cases by the daily press and popular magazines. Copy makers have garbled scientific facts into sensational matter in a way to do grave injustice to the dairyman, while the agricultural press has gone as far in the other direction in exciting the farmer to opposition against the city authorities. Dairymen have organized in some instances with the avowed purpose of warring against the city authorities. The latter have retaliated with threats of prosecution under the anti-trust laws. As is always true in commercial war, both parties have suffered.



Milk Standards.—When the supervision of the city milk supply was first instituted, attention was paid chiefly to watering, use of preservatives, coloring matter, and amount of butter fat and total solids. Positive standards in these matters were readily established, and the machinery for their enforcement was put into motion. At first there was some little difficulty in establishing a standard for composition high enough to insure normal milk and not exclude pure milk from cows producing a small percentage of butter fat and total solids. In some cases it is possible that a hardship was imposed upon the man who had cows which produced milk below the standard, but the necessary adjustments were made, and at the present time the machinery for enforcing the above standards works with comparative smoothness. While these standards are violated at the present time, very little is heard of them, for they are positive. With the inspection machinery in proper operation, there is no doubt in the mind of either the producer or the inspector as to whether a standard has been violated, and definite results are thus secured. The inspector is able to obtain a sample of milk offered for sale at any stage in its production or subsequent handling, and in a reasonable length of time tell whether it conforms to definite standards in the points mentioned.

Bacteria in Milk.—It was soon found, however, that with these points in city milk control looked after, only a beginning had been made; that, owing to special conditions surrounding the use of milk as a food and the action of bacteria in milk, bacterial control is of much greater importance and infinitely harder to deal with than standards for composition and adulteration. The greater dangers from bacteria in milk as compared with other foodstuffs arise mainly from the fact that milk is one of the best mediums for germ growth. An infection infinitely small at the start reaches stupendous proportions in a few hours. Milk is a universal food and is used in the raw state to a greater extent than any other food. Disease germs in meats and vegetables do not have the same significance as in milk, because they are killed in the cooking process.

While material differences of opinion exist among students of the subject as to the relative danger from different types of bacteria, there is enough knowledge upon the subject to state that milk containing certain specific germs, such as the typhoid bacillus, should be excluded entirely, and that the numbers, at least, of other germs should be restricted. Of course the aim should be the entire exclusion of bacteria, but this, like other ideals, has not been nor ever will be reached. The problem therefore resolves itself into the determination of what types of bacteria are to be legislated against and the detection of these germs when present in the milk. The first of these propositions is at least in a fair way to solution. The second is being approached indirectly. If our development in bacteriological technique was such that a sample of milk offered for sale could be quickly and accurately ex-

amined to see whether there were present any objectionable bacteria, the problem would resolve itself into the institution of such policing of the milk trade as has been so effective in enforcing the standards for composition. Unfortunately, this condition does not exist. Under present conditions, it would take days, or even weeks, to examine a sample of milk and determine whether it was objectionable from a bacteriological standpoint. The question, however, is one of grave importance and must be handled with the best tools available.

The Score Card and the Health Board.—From a milk control standpoint, bacteria may be divided into two classes, the pathogenic or disease germs being placed in one class and the remainder in the other. Theoretically, the disease germs should be controlled by requiring the physician to report promptly to the health officer all contagious diseases being treated by him. If the disease is located in proximity to a source of milk, quarantine provisions are prescribed to meet the case. In practice, however, it is a well established fact that a person may be spreading typhoid fever for months without his knowledge or that of his physician. While this method is admittedly defective, it is questionable whether science has anything better to offer at present. The control of the general bacterial content of milk has been effected by the most indirect methods. It is generally conceded that "cleanliness is next to godliness" in the milk supply as in many other things. From time immemorial there have been discussions regarding standards of cleanliness, and the milk problem is no exception to the rule. After the most careful investigation and thought, it has been decided that certain conditions surrounding the production and distribution of milk tend to cleanliness and sanitation. These conditions have been classified with their relative weights and constitute what is known as the dairy *score card*. It should be noted that this score card does not deal in a single instance with tested and

A MODERN PLANT THAT COUNTS FOR LITTLE.

For the individuality counts for something, as well as equipment. This modern sanitary dairy, owned by a rich stock company, did not produce as good milk as Mr. B did. This was because of the difference in the habits of the workers. The average score of this plant for three months was 96.2; the average bacteriological count, 19,769. The score is as high as it is because emphasis is laid upon equipment.

TOO COSTLY TO BE PRACTICAL.

A modern dairy plant which cost, including the milk house, which is not shown, $1,000 per cow. $1,000 at 6 per cent. would be $60, more than the gross receipts from some cows. The masses will not be supplied with milk from such stables.

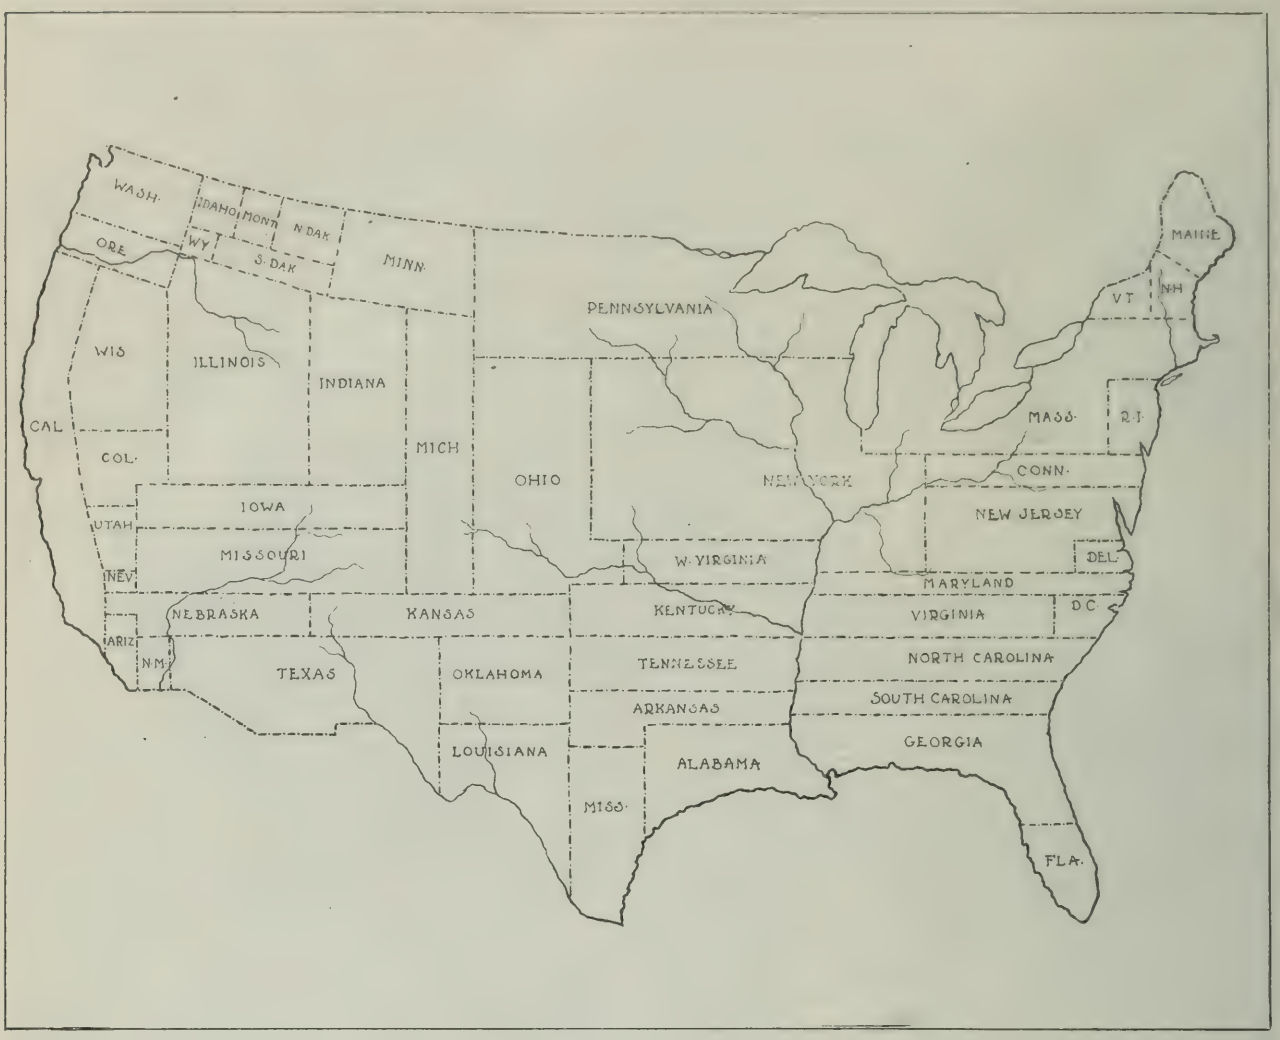
determined properties of the milk, but has to do entirely with the conditions under which the milk is produced and handled. An illustration of its working, from the producer's standpoint, may be taken from the example presented by A and B, who owns farms on opposite sides of the road. A is a man of some means who went into the dairy business in a commercial way, equipping himself with modern facilities. B is a man of small means who had a mortgage to meet on his farm. He was able to get together about twenty cows to start his dairy, but did not have funds to furnish himself with modern equipment. He, however, is an intelligent man who is doing his best to produce a clean product. Both he and his wife, who assists him in the care of the milk, are naturally clean in their habits. Bacteriological counts of these two dairies were taken for a period of four months. A's milk showed an average of 30,000 bacteria per cubic centimeter. B's milk during the same time showed an average of 9,000 bacteria per cubic centimeter. B was well aware of the fact that he was producing a better grade of milk than A, but the score card showed quite a different condition. It should not be inferred that this is the general working of the score card, for it is not; but it does represent what is happening in individual cases, and there is little wonder that the producer is often dissatisfied. To him, in many cases, it appears that the city health board is exercising a paternal influence over him in prescribing what he shall and shall not do in the production of milk without definite bearing upon results. When, as is unfortunately the case at times, the inspector is a young man of limited experience and common sense, the situation becomes crucial. The small producer is often ignorant of the principles underlying sanitary dairying, and sometimes slovenly in his habits. There is no place in milk production for the slovenly man, whether he be equipped with modern apparatus or not. It is, however, true, that many intelligent, well-meaning dairy farmers, when confronted with city milk inspection, find upon investigation so many crudities and so many miscarriages of justice that they give up in disgust and go out of the business. Others who would naturally go into the milk business fail to do so for the same reasons. This is unfortunate for the consumer, for in my opinion it is responsible for more milk famine than any other factor. There is a marked and, in some cases, growing distrust of city milk inspection upon the part of intelligent, honest producers, which, unfortunately, is not entirely without foundation. Where the inspector is of

the highest type, it is at the minimum, but under the best conditions it is present to a greater or less extent. The present tendency is to put the production of milk in the hands of the large cow owner, where the equipment and supervision are almost invariably better than with the small producer. The detail work in such cases, however, is done by "hired help," and such labor is always of a lower grade than that of the small producer who does his own work. It is a question which is more important in sanitary milk production, the equipment or the individuality of the laborer. There is invariably more danger of contagious diseases from the large producer than from the small one.

While present methods of milk inspection present many crudities and imperfections, they should act only as a stimulant to greater activity upon the part of city health boards. The danger to health from the milk supply is an ever present one and can not be disregarded with impunity. The producer should recognize the fact that the city health board is acting only in accordance with an imperative duty and is using the best means at hand to bring about desired results.

The two bodies of scientists responsible for the present score card are the American Association of Medical Milk Commissions and the National Association of Dairy Instructors. The personnel of these two bodies should be such as to guarantee that the score card embodies the latest and best thought on the subject. Many investigators are working to perfect methods of milk inspection, and it is hoped that many of the imperfections evident in the present methods will shortly disappear. In the meantime, the utmost patience should be exercised by both the producer and the consumer.

FOR CLEAN MILK, A CLEAN TURF.



No more sanitary conditions can be had for the production of clean milk than a clean green turf. The farmer of small means has always been the great agricultural producer in the United States. The present tendency of city milk inspection to demand expensive equipment forces many such men out of the business, and is likely to be a disadvantage to the consumer.

BLACKSBURG, VA.

Apportionment Map of the United States

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

THE map shown on this page is drawn on the principle that the population is evenly distributed thruout the whole United States, and that the area of the States varies directly with their population. With the map constructed on this principle some curious changes become apparent. On the ordinary map the four States, Montana, Wyoming, Colorado and New Mexico, together with the seven States which lie to the west of them, comprise more than one-third of the territory of the United States, and the area of each one of them is considerably larger than that of New York State; yet the population of New York State alone is nearly one-fourth larger than the combined population of these eleven Western States. In fact, the entire territory to the west of the Mississippi River contains only about 5 per cent. more people than are to be found in the New England States, together with New York, New Jersey and Pennsylvania. Yet the territory at present covered by these nine Eastern States is only about two-thirds as large as the State of Texas. If we should add to these nine Eastern States the population of Ohio, the total would be greater by about three millions than the entire population west of the Mississippi. The State of Rhode Island, hardly visible to the naked eye on the ordinary map, now becomes almost as large as the territory of Utah and Arizona combined.

Were Texas as densely populated as is the State of Rhode Island, it would contain a population of nearly eighty-five millions, leaving only six millions of our people to be scattered thruout the rest of the country. Were the population of the United States as a whole as dense as that of Rhode Island this country would have more than a billion inhabitants.

New Haven, Conn.

LITERATURE

The New Britannica

To mobilize the most vital information of mankind, to marshal it in orderly divisions, and to project it in simultaneous assault on the ramparts of ignorance otherwise inexpugnable: this is the mission of a general encyclopedia. With prestige won twenty years before the French Revolution, the *Britannica* has once more attempted the perennial task. The present year will see the publication of the full quota of twenty-nine volumes, fourteen of which are already in the field.*

The edition is noteworthy in two respects, economy of space and simultaneousness of production. The use of India paper makes it possible to compress the vast material into twenty-nine inches of shelf room, each volume being light enough to hold in one hand, and flexible enough to carry about in a traveling bag. Tho the book may be had on ordinary paper, the India edition, in its expensive because honestly tanned leather bindings, makes the thick tomes familiar to one's childhood seem oppressive nightmares.

More significant than sumptuous dress and the pomp and flutter of fine paper it is that the entire work comes out in a single year. When the last volume of the ninth edition appeared, the first was fourteen years out of date: and this piecemeal production made it impossible to unify the entire set. Now, however, by the co-operation of a large and expensive office force, the entire series has been edited as a whole, possessing structural unity and thorogoing up-to-dateness. By an elaborate and fascinating system of card indexes the London office kept track of the articles at every stage of preparation, and analyzed their contents when completed in such thoro fashion that both duplications and omissions were instantly brought to the attention of the editors.

With forceful diplomacy Mr. Chisholm and his associates galvanized into simultaneous productivity fifteen hundred contributors scattered all over the globe. It was proposed to have the work ready in three years; but delays inseparable from vast undertakings have lengthened the period to eight; yet the printing of all the volumes at practically the same time made it possible to keep the articles open to the last moment, so that the new *Britannica* has the charm of freshness, the enviable privilege of speaking the last word.

The great drawback to the use of the old edition was that its articles were too long, being veritable treatises into which only the persistent would penetrate. The present work contains but 3 per cent. more words, but over double the number of headings. Many of these are, to be

HUGH CHISHOLM, M.A.,
Editor of the Encyclopedia Britannica.

*THE ENCYCLOPEDIA BRITANNICA. Eleventh Edition. 28 vols. and index. New York: The Cambridge University Press. $4 to $7.50 per volume.

sure, merely elaborate definitions of an expanded dictionary type, inserted in order to make the encyclopedia self-explanatory; but most of the new topics represent either novel subjects, such as aviation, or they have arisen by breaking up the old material into more manageable masses. In this labor the headings employed in the chief European and American works of reference were collated, and 40,000 chosen, it being decided to let an index with 500,000 entries serve as the guide to minor details, rather than to chop all the extended articles into bits for ready reference. Thus the value of the *Britannica* as a comprehensive and scholarly tool is preserved, and its use greatly facilitated, without the sacrifice of lucidity to detail.

The contributors were carefully chosen from the world of international scholarship. There was gossip some years ago that many Englishmen were disgusted with the former American owners of the work, and refused to have anything to do with it; if that was ever true, it has not injured and possibly has improved the book; certainly the list of British contributors contains the names of leaders so brilliant that in their light one cannot see any gaps left by the disgruntled. A considerable part of the work was done on the Continent, and a very large proportion in America. If Columbia and Cornell figure very strongly in the lists, this is doubtless due to the fact that the American office was situated in New York and enrolled writers better known in the metropolis than some of their equally competent but distant confrères.

Is the *Britannica* what it claims to be, not a revision but a new work, by men who speak with authority on matters of common agreement, with prestige on subjects where they can make contributions to knowledge? This was the honest intention of the publishers, and they showed it in their dealings with contributors. They sent copies of the old articles, with instructions to revise or rewrite as one pleased; but in 90 per cent. of the work submitted by the groups known to the present writer, it was found easier to compose from the ground up rather than to patch or use the blue pencil. This was particularly true of minor articles on historical subjects, where the layman might expect the old presentation to remain adequate; the advance of knowledge and the exactions of style compelled a fresh creation. In a recent review Mr. Joseph Jacobs said he thought that four-fifths of the new edition was merely reprinted from the ninth edition and its supplement of 1902; but Mr. Chisholm was undoubtedly correct in retorting that the proportion of old to new was not as four to one, but as one to four.

To estimate in detail the scholarship shown in the various articles would be a thankless task, fit only for one whose foible is omniscience. Of course the unevenness of execution inseparable from a co-operative undertaking shows in many details, most patently perhaps in the bibliographies, of which, however, those produced in America and those by the younger generation of English scholars usually come up to the modern standard. The most unsatisfactory feature here is the occasional citation in the text of mutilated titles, which may prove hard to identify. As to substance, however, the field with which the present reviewer is most familiar is well done: the contributions to exegetical, historical theology are mostly the new work of conscientious men of many shades of opinion, from Roman Catholics on the one hand to extreme radicals on the other; and tho they may not always have achieved imperturbable objectivity, it is not because they did not endeavor to fulfil the function of the *Britannica*, which is to speak in the name of science.

Is Mankind Advancing?*

THIS is a brief for the negative. Mrs. Martin regards the ancient Greek as the highest level ever reached by the human race, and in support of this thesis she cites numerous distinguished authors in praise of the Greeks, draws up comparative lists of the great men of different centuries, and contrasts the evils of our civilization with the merits of the Greek. Dr. J. J. Walsh is equally plausible when he calls "the thirteenth the greatest of centuries," and we should enjoy hearing a debate between Mrs. Martin and him.

There are two distinct questions in-

*IS MANKIND ADVANCING? *By Mrs. John Martin.* New York: The Baker & Taylor Co. $2.

MRS. JOHN MARTIN.

volved in this. One is whether there has been any improvement in native capacity and the other is whether there has been any improvement in the conditions of life. The first question is still an open one and perhaps can never be settled. Is there any man now living who is the superior of Aristotle in intellectual power, or is there any community of the same size which has as many men of genius as Athens had? Galton was the first to attempt a scientific solution of this question, and he is not altogether convincing, because of the difficulty of distinguishing priority from pre-eminence, and of making allowance for the progressive accumulation of prestige. How can we tell whether any one among the captains of our trans-Atlantic liners is a greater navigator than Columbus?

The other question of whether we have an advantage over the Greeks in science, art, literature, morals, religion, government, health and mode of life is not so ambiguous, and Mrs. Martin, with all her ingenuity in argument and abundant citation of "proof-texts," is not able to make out a plausible case. It depends, of course, largely upon the point of view. As a Fabian Socialist, the author regards the modern wage system as worse than Greek slavery. As an advocate of the simple life she finds the primitive conditions of Greece superior to the complexities of ours. As an anti-suffragist, she is not horrified at the subordination of the Greek women. As an opponent of mysticism of every kind Christianity does not seem to her altogether an improvement.

Fortunately, this question is one that need not be argued about, for it is easily decided by experiment. Greece is still a sparsely settled country, and any persons who prefer may go there and live the old Greek life, discarding all our modern science and machinery, speaking the Greek language, and practising, so far as the laws of the land will allow, the old Greek morality. Nobody seems inclined to try it except Raymond Duncan, and he has given it up, preferring to live in New York, Chicago or Philadelphia.

Eighteenth Century Letters

THE Duke of Argyll has chosen from his archives a goodly number of letters, has written a preface and some rather ill-balanced editorial notes, and has sent all this matter pell-mell to the press.[1] In spite of the fine names signed by the correspondents, their letters are now to be bought and sold in the book mart. One's impression in reading them is that rank does not confer epistolary distinction. For our part, we prefer Gray's leucocholy, reflected in correspondence, or Dr. Johnson's sober style—represented here in one undistinguished example—to the letters, say, of Elizabeth Hamilton and Argyll. The correspondence which fills the first of these needlessly unwieldy volumes does, however, throw light upon the way in which the great Scottish families clung tenaciously to privilege and power. The letters which open that

[1] INTIMATE SOCIETY LETTERS OF THE EIGHTEENTH CENTURY. *Edited by the Duke of Argyll, K. T.* With portraits, facsimiles and other illustrations. Two volumes. New York: John Lane Co. $10.

volume, headed, "The Union of England and Scotland," are signed, for the most part, by that Duke of Argyll who, as commander-in-chief in Scotland, led in person at Sheriffmuir against the Stuarts. Lord Leven, the third of that title, is another correspondent. These letters were addressed to Godolphin, Queen Anne's Prime Minister. Among the domestic documents, a partial set of Holyrood Abbey accounts, 1759-1782, will have interest for the studious. Of a more personal nature is the correspondence in regard to the famous Douglas case, 1763-67. These concern the question whether the two children brought forward by Lady Jane Stewart as her own, and, therefore, as heirs to her brother's estates, were as represented, or "French peasant brats." The story has elements of universal interest, but the letters themselves are more valuable to the historian than diverting to the seeker of amusement. The latter type of reader is bound to find more agreeable the gossip of Mrs. Burgoyne. This good dame makes it clear enough in one letter to Her Grace of Hamilton that card playing for high stakes is no innovation in "society": it is only too true, she sighs, that "Miss P. lost in one night £500 & next £1,500, and paid it all the next day." Then there is a satiric account of life at Chatsworth Abbey in the day of Georgiana, Duchess of Devonshire. Why there is no note of its authorship, even so much as a statement that its authorship cannot be traced, does not appear. It was a sane program, if we may credit any part of the narrative, as we surely can, if we use discretion. The ladies' absurd hours of rising, napping and retiring; their scatterbrained letter writing, amusements and conversation; their want of common sense in dressing for a walk after dinner—all these things remind us that mortal folly is no invention of our own.

Really, however, we suspected as much already; and it is undeniable that the second of these portly volumes is more interesting than its predecessor. It opens with a budget of letters by and concerning Douglas, Duke of Hamilton, the second son of Elizabeth Gunning by her first marriage. This Duke was, by all indications, a weak vessel. He died in the year 1799, and these letters date from the period of his grand tour, made in company with Dr. John Moore, the father of the "hero of Corunna." Very amusing are the worthy doctor's perplexities over his charge's amours, actual or incipient. He reports that the seventeen-year-old's sleep, at Geneva, was broken by dreams of a certain "girl" unnamed; he writes a little later, from the same place, after commenting on the young Duke's graceful performance of the minuet, that he attached himself to a Madame Cozenof: "The Duke says the devil's own eyes cannot possibly be blacker—I believe he is a little Catched by this Lady," continues the observing tutor.

> "This is the third Passion the Duke has had since we cross'd the Sea. They generally affect his appetite, and I can make a pretty good guess of the hight of his Love by the Victuals he Refuses to eat. A Slight touch of Love puts him immediately from Legumes and all kind of Jardinage. If it arises a degree higher he turns up his nose at Fricasses and Ragouts. Another degree and he will Rather go to bed supperless as taste plain Roasted Veal or Poulets of any sort. This is the utmost length his passion has ever come hitherto, for when he was at the worst with Mademoisel Marchenville, tho' she put him intirely from Greens, Ragouts, and Veal, yet she made no impression on his Roast Beef or Mutton appetite."

Dr. Moore became more serious when the Duke met the Countess of Albany in Florence.

The account of this young man's diversions and associations is pretty unsatisfactory, and the few great names which appear are associated with no interesting events. Yet he seems to have been impressionable, and writes to his mother from Switzerland (August 23, 1773) of the beautiful trees, valleys and hillsides he has seen in Savoy:

> "Nothing can better prove the superiority and Grandeur and Magnificence of the works of Nature above those of Art. Versailles is the labour of a child when compared with the Mountains and Valleys of the Alps."

He continues:

> "The Glaciers resemble the sea in a storm, if you supnose it instantly frozen while in its highest agitation."

For the student of literature, there is a distinct historical value in eighteenth century accounts of Nature: and Swiss Nature is uncommonly important here.

It so happens that another writer of "Society Letters" interested himself in Switzerland. This was Lord John Campbell, who was born in the 1770's and died in 1848. Lord John was an intimate friend of M. de Saussure, son of him who first ascended Mont Blanc. This gentleman, who was very hospitable to English travelers, seems to have been responsible for bringing together Lord John and Madame de Staël, who wrote a good many letters to the Englishman, and made him the hero of "Corinne." The letters of a lady dear to Lord John, one Miss Glassell, also tell of abysses black with pines and rock-masses, of galleries and waterfalls (Como; November 1, 1818); but the date of this letter is too recent: and no credit attaches to admiring Switzerland since the composition of "Childe Harold." If one could find space for other matters than Switzerland, one would note the presence of letters, of no particular importance, signed by Rob Roy, Felicia Hemans and George Washington. But what, one may ask, did "a gentleman unknown to Lady Gower" mean when he wrote to her, from Paris, in the year 1786, "of General Washington's having resigned his command upon account of their [the members of Congress] having declared themselves independent of Great Britain"? (I, 321).

Another eighteenth century letter-writer was General Wolfe, represented by a stout volume of *Life and Letters*, edited by Beckles Willson.[2] If genius is, as has been represented, a capacity for hard work, James Wolfe was a great genius, and so, historians seem to agree, he was. It is fortunate that his genius is so strong that it needs no bolstering up from a biographer. Not that Mr. Willson is unequal to the task he has set himself, for he is admirably equipped, knowing to perfection both Wolfe's England and his Canada, as well as the life of the hero himself. Mr. Willson has, moreover, been a diligent searcher after new details and documents, and successful as such. But he has been unmercifully long-winded, both in his own contribution and, more especially, in his reproduction of said "documents." As a letter writer neither Wolfe nor his family show talent. James Wolfe himself was, even as a very young man, dutiful, and "English" (in the most provincially American sense of the word) to a degree. Neither in his faults, such as they were, nor in his merits was he one

FROM "SOCIETY LETTERS."

whose minutiæ greatly divert one. The book about him which extends to five hundred pages must necessarily include, therefore, many dull chapters. Our own private test of the letter writer is this: We examine his letters from Paris. If these do not entertain us we give him up as a hopeless correspondent. And James Wolfe, tho he visited France in the Pompadour period, and even kissed that lady's hand at court, does not write diverting letters from the Ville Lumière. Of course, he remains a great military hero. And possibly we may ascribe the dreariness of his correspondence to the qualities of his correspondents. One's friends are no less important than one's own personality.

Yet the noble patriotism which was James Wolfe's finds expression here. And perhaps the most valuable part of the correspondence is to be sought in

[2] THE LIFE AND LETTERS OF JAMES WOLFE. *By Beckles Willson.* New York: Dodd, Mead & Co. $4.

Wolfe's criticism of British military discipline, education and tactics. He was justly disgusted with the narrowness and inadequacy of both the last.

Douglas Jerrold and Punch. By Walter Jerrold. New York: The Macmillan Co. Pp. xi-447. $4.00.

There already exists a well-written and adequate "Life of Douglas Jerrold," published by his son half a century ago, and the grandson of Douglas Jerrold in this new tribute to his grandfather's work and memory has concerned himself only with Jerrold's connection with *Punch*. It is thus a book with a mission—to recall and make understood the part that Jerrold had in the establishment of *Punch;* and if it has any shortcoming it is that its author has not drawn upon Blanchard Jerrold's biography of his father. Jerrold was thirty-eight when *Punch* was begun; and Mr. Walter Jerrold starts off as tho everybody knew all about his struggles and achievements up to this time. For about sixteen years Jerrold wrote continuously week by week for *Punch;* and in the early years when *Punch* was finding itself, and creating its constituency, at least so far as the letterpress was concerned, Jerrold's was the laboring oar.

THACKERAY AND JERROLD OVERHEAR THE DAMNING OF "PUNCH."
(From a drawing by Thackeray, reproduced in "Douglas Jerrold and *Punch*.")

Nowadays *Punch* is sometimes with the Liberals; at other times it shouts with the other crowd. During the first five years of its existence there could have been no difficulty in determining its place. It was certainly not Tory. Equally certain it is that it was not Whig, for there was never for long in the nineteenth century any great difference at bottom between Whig and Tory; and in those days when there was much less democracy and more privilege, and consequently more injustice in political, ecclesiastical and social conditions, than there is in these later days, *Punch* was always on the side of democracy in the most comprehensive acceptance of the term. Among the many interests of the book, not the least is that it serves to show how far England has traveled along the path of political and social progress since the days when *Punch* was strenuously political. In those years *Punch* had a mission, and was not afraid to criticise royalty, or aim its shafts at a self-absorbed and self-worshiping landed aristocracy, as witness Jerrold's gibbeting of Lord John Manners, who died a year or two ago as His Grace the Duke of Rutland, when in 1844 Manners perpetrated the couplet that harassed him for the rest of his mortal life:—

Let wealth and commerce, laws and learning die,
But leave us still our old nobility.

Punch in the forties had also a rough tongue for an established church with

a religion that was respectable rather than an active force in life; and it tilted fearlessly at the corn laws, the game laws, at deer hunting, at public hangings, and at justice as it was administered under a criminal code only slightly less barbarous than it had been in the last half of the eighteenth century, when all English institutions—Crown, Parliament and criminal law included—were at their lowest level.

Diaz, Master of Mexico. By James Creelman. New York: D. Appleton & Co. $2.

This is a very readable account of the life of Mexico's President. Whether it is as impartial as its preface maintains is another matter, but the subject is one which cannot fail to be of interest. The book is not profound, but it does give a good sketch of the exciting career of its subject, a man who would stand head and shoulders above the crowd in any country, and may well lead the reader to explore more thoroly the story of a country whose lights and shadows, romance and pathos, grow more fascinating the more one studies them. The reader will not be imprest by any sense of the author's impartiality. The book is one which would never fall under the ban of the present Government's censorship. The authority to which reference is continuously made, and which is quoted at length verbatim, is Diaz's own autobiography, while opposition to the hero's progress appears, at best, to have consisted of "merely beautiful abstractions of imaginative democracy." Diaz began his career as an insurgent and a radical, protesting against the fearful incubus of a Church which had drifted away from its true vocation to fatten upon an overburdened people. Like most insurgents who are intrusted with power and responsibility, he now finds himself in the front ranks of the conservative element. By his truly wonderful ability he has created out of chaos a great material prosperity, bringing in its train economic problems with which he must now grapple. The railroad mileage, the power plants, the huge factories, to which his followers point with pride, demand a market—not a foreign market, but one in Mexico itself. The growing middle class has scarcely begun to fill the gap between men of great wealth and men of great poverty. The vast mass of the latter must be freed from the system of practical peonage which most certainly exists in many localities, and from the burdens of the great landed estates, and raised to a level where they can become consumers of the vast output of factory and plantation which the country is so able to produce and does produce each year in increasing quantities. It is not merely a discontented lot of men that Diaz faces, but a great economic situation which he himself has created. Of all this there is nothing in Mr. Creelman's eulogy, while there is almost as little of the mystery and romance which have appealed to other writers. His book is worth reading provided the reader does not permit himself to rest contented with one side of the story only.

Literary Notes

....A new and revised edition is now issued by the Macmillan Co. of L. H. Bailey's *The Outlook to Nature,* first published in 1905. Part of the fourth lecture first appeared in THE INDEPENDENT.

....Duffield & Co. publish Norwood Young's "Study in Environment," *The Growth of Napoleon* ($3). This is an elaborate work, interesting in its illustrations, and showing the evidences of extensive study, without being a very convincing or inspiring essay.

....Mr. Aaron M. Crane in his *Search After Ultimate Truth* (Lothrop; $1.50) deals with great subjects in a rather inadequate and outworn fashion. His logical concatenations do not throw much light on such questions as "the origin of God."

....Bishop W. F. McDowell delivered the Cole Lectures for 1910 before Vanderbilt University. In them he has embodied his ideal of the preparation for and active life in the ministry as deduced from the life of Christ. The title of the lectures, *In the School of Christ* (Revell; $1.25), is aptly chosen, but the subject is by no means exhausted in the book.

...."Napoleon, a Prodigy without Greatness," is the title of one of J. N. Larned's essays in the volume, *A Study of Greatness in Men,* published by Houghton, Mifflin Co. ($1.25). Cromwell, Washington and Lincoln are the other subjects of Mr. Larned's study. We hope that the book will have wide circulation: not for Mr. Larned's good, but for the reader's.

....An article in the *Vie intellectuelle*, of Brussels, states that in 1910 6,883 new books were published in Italy, and that out of 1,000 volumes published there 700 have a life of less than one year, 200 live two years or less, 70 three or four years, 20 a few years longer. Out of the 10 remaining volumes, some may be expected to attain immortality, if only to raise the general average.

....The French Academy has decided to found a Grand Prize of $2,000, to be awarded annually for a novel "inspired by lofty sentiments." The members of the Academy desire to honor and to encourage a branch of literature to which eminent writers like MM. Loti, Barrès, Hervieu, Bourget, and other academicians owe their chairs. The prize jury will consist of the novelist members of the Academy, the Comte d'Haussonville, and the historian Lavisse.

....*The Dilemma of the Modern Christian* (Sherman, French & Co; $1.20), as Mr. E. H. Eppens sees it, is brought about by the progress of scientific knowledge and Biblical criticism and their infiltration into the popular mind, and the way out is along the route of a juster estimate of the place of Jesus in religion and history. The book is a plea for more rational conceptions among orthodox believers, and is written with poise and reverence from the orthodox point of view.

....*Business*, a four-act play by G. Lowes Dickinson, has been produced by the London Stage Society. It deals with the American trust and has for its leading figure the personification of John D. Rockefeller, who is confronted by a dramatized Ida Tarbell. The trust magnate crushes his competitors, opens institutes for "young Christian men of business," teaches Sunday school and eventually gets shot by one of his victims. American men, women and children are all ridiculed in the play. The author, who is a Fellow of and lecturer at Kings College, Cambridge, and lecturer at the London School of Economics and Political Science, has in earlier non-dramatic writings attacked American tendencies.

....Dr. Timothy Richard's long residence in the East and his sympathetic study of the religious faiths of the Chinese have given him special fitness for presenting to the Western World what he calls *The New Testament of Higher Buddhism* (imported by Scribners; $2). Dr. Richard believes that many doctrines common to both Christianity and the later Buddhism, as taught in China and Japan, have their origin in Babylonia, and that these doctrines form a strong bond of union between the two religions. Many of the familiar teachings of both Old and New Testaments find striking parallels in the two works here translated: "The Awakening of Faith" and "The Essence of the Lotus Scripture."

....The American Economic Association at last follows the lead of the American Historical Association and the American Society of International Law, and has started its own review. The first number of the *American Economic Review*, dated March, 1911, is before us. Its editorial office is 491 Boylston street, Boston, Mass., and its publication office at 30 Nassau street, Princeton, N. J. Price, $1 a number. The editors are:

Jacob H. Hollander, Johns Hopkins University, chairman.
Henry W. Farnam, Yale.
Henry B. Gardner, Brown University.
Edwin W. Kemmerer, Cornell.
Henry C. Taylor, Wisconsin.
Allyn A. Young, Stanford.
Davis R. Dewey, Technology, managing editor.

Judging by the first issue, which contains 212 pages, this is destined to be the leading economic review of this country. Already the *Yale Review* has been abandoned and merged with the new magazine.

....Those who would like to know how their estates may be affected by inheritance tax laws in force outside of the State in which their homes are situated can find all the needed information in *Inheritance Taxes for Investors*, a book of 140 pages which is a reproduction of a series of articles originally published in the financial daily paper of the Boston News Bureau. These have been revised and annotated by Hugh Bancroft, formerly District Attorney of Middlesex County. All but ten of the States now have inheritance tax laws, and at least fourteen of them tax shares of companies incorporated under their laws, when these shares are part of the estate of a non-resident. Such practice involves double taxation, and this subject is thoroughly considered in the book. The laws of each State and of Canada are carefully explained by Mr. Bancroft, who makes his explanations valuable to attorneys as well as to investors by adding well chosen references to decisions in important cases. The book will assist the movement for uniformity in inheritance laws and against double taxation. (Boston News Bureau Company; $1.)

....The growing knowledge of child-psychology and the investigations of the materials for religious education, particularly the Bible, are revolutionizing the methods and organization of Sunday School work. The religious press is turning out many suggestive books along the newer lines. Those who are looking for wise guidance in making changes will make no mistake in securing the two "Modern Sunday School Manuals" published by Eaton & Mains: *Organizing and Building Up the Sunday School* (65 cents), by J. L. Hurlbut, and *The Graded Sunday School in*

Principle and Practice (75 cents), by H. H. Meyer. For both Sunday School teachers and parents Dr. A. H. McKinney's *Our Big Boys and the Sunday School* (Revell; 50 cents) is full of information and suggestion much needed in dealing with adolescents. *In the Master's Country* (Doran Co.; 50 cents), by Martha Tarbell, Ph.D., consists of a series of well arranged and properly illustrated studies in the geography of Palestine. The descriptive material is reliable and suitable for class work, but the "Chronological Life of Jesus" should be received in the spirit of the author's own note, which declares that the events even of his public ministry cannot "be arranged with certainty in chronological order."

....Do not assume that, because its subtitle is 'Essays for the Young People," the anonymous volume, *I Wonder,* is intended for the very youthful (Macmillan; $1.25). On the contrary, Aristotle's name is spoken on page one. The essayist is an enemy of the motto, *nil admirari*—"a motto suggested by the devil in a most red-hot moment." The eight chapters treat of the Wonder of Matter, of Nature, of Self, of Pain, of Death, of Beauty, etc.

....The *Encyclopedia Britannica* has developed somewhat since publication was begun in 1771. Furthermore, the point of view both of those who make encyclopedias and those who use them has, in some respects, altered. The following is a complete article, from the original edition:

"Landskip, or Landscape, in painting, the view or prospect of a country, extended as far as the eye will reach.

"Landskips are esteemed one of the lowest branches of painting, representing some rural scene, as hills, valleys, rivers, country houses, etc., where human figures are only introduced as accidents."

....Statistics of the University of Paris show that in 1910 there were registered in the Law School 976 foreigners, almost all Russians; at the Medical School, 434 males and 302 females of alien birth; at the Faculty of Sciences, 502 foreigners, of whom more than a third were women; at the Faculty of Letters, 540 male and 789 female students of foreign birth, in the following order: Russians (589), Germans (200), Americans (99), English (97), etc. Of 3,565 foreigners registered in various departments of the university, almost precisely one-half were Russians.

....It is the distinction of *The Corsican,* "A Diary of Napoleon's Life in His Own Words" (Houghton, Mifflin Co.; $1.75), that, except for a few bracketted passages, the matter is derived from the Emperor's own words written or spoken, tho there are, of course, condensations and transpositions. The transposer is Professor R. M. Johnston, of Harvard, who has made a telling "autobiography." (Nowadays it is a wise autobiography that knows its own author.)

....A novel published serially under the title, "The Admiral's Niece," now makes its appearance with the imprint of the Houghton, Mifflin Co., as *Robinetta.* The authors are the group responsible for "The Affair at the Inn," Kate Douglass Wiggin being the best known of the collaborators. An agreeable story demonstrating that blood is thicker than water, of which the scene is a country house in Devon ($1.10).

....The latest volume of Putnam's brief histories of the sciences is devoted to *Anthropology,* one of the youngest of the sciences notwithstanding that it was early realized that "the proper study of mankind is man." Mr. A. C. Haddon has the advantage over other authors of the series, in having a clear field, for this is the only history of anthropology which has yet appeared, so the author had to break new ground as well as to cover much old ground in this little volume (75 cents).

....The *Bookman* takes comfort in the thought that, despite certain literary shortcomings, the present age has produced "the most widely known character in all fiction." In comparison with this character, Crusoe, Sam Weller, Mr. Pickwick, Uncle Tom, Monte Cristo, Don Quixote, Aladdin, Old Mother Hubbard, are, all of them, "strangers." If you doubt it, continues the authority we paraphrase,

"try an experiment, as we have done, with half a dozen urchins in the street, and see if you can find one to whom the name of Sherlock Holmes does not bring an expression of instant recognition,"

....Dr. Albert Leffingwell's *American Meat* (New York: T. E. Schulte; $1.25) shows the need of more careful inspection of the packing houses and greater frankness in the labeling. But the author would make a stronger plea if he did not take such an extreme and impracticable position on the question. A perfectly healthy animal is as rare or as non-existent as a perfectly healthy man, and to prohibit the use for food of any part of a carcass showing a trace of disease would be to make vegetarians of all of us. But this would just suit Dr. Leffingwell.

....When we printed in THE INDEPENDENT the letter George Borup wrote to his father, telling many unpublished details of Peary's successful expedition, we called the letter the most human document that the North Pole discovery had produced. A book has now appeared from the pen of this young author (*A Tenderfoot with Peary*—Stokes—$2.10). It is written in the fluent style of an enthusiastic college student. Many of the author's words are not found in the dictionary, and his quotations from prose and poetry are not to be located in standard collections of literary gems, but the book vividly describes an important side of polar life and is well worth reading.

....Anatole France is confronted with a curious lawsuit. Twenty-nine years ago he sold to a publisher two volumes of a history of France which he had written. The price was $600. Lemerre, the publisher, delayed the printing of the books till last November, when he sent the proofs to the author. M. France refused to return them, saying that he would not consent to the publication of the books at that late day, as they no longer represented his opinions. Now the publisher sues for the return of the proofs and says that if they are not returned he will publish the book without the author's consent.

....In the Greek Series for Colleges and Schools the American Book Company has just issued *A Handbook of Greek Religion* ($1.50) by Prof. Arthur Fairbanks, the director of the Boston Museum of Fine Arts. While the book is well adapted to student work, it will appeal also to a much wider circle of readers. It is characterized by thoro scholarship and sober judgment, and the author's faculty for selecting the significant and his method of presentation contribute very materially to a clear understanding of the great mass of data with which a writer in this field must deal. The book is well illustrated.

....Live literature is now mostly to be found in magazines. When it gets into books its period of greatest influence is usually past. This is especially true in America and that is why we have the best periodical indexes in the world. The German periodical indexes are poor and the French have none at all. The extent, importance and variety of magazine articles is shown by a glance at the *Reader's Guide to Periodical Literature,* of which the second volume covers ninety-nine periodicals for the period 1905-1909. It contains 2,500 pages of titles indexed according to admirable methods used by H. W. Wilson Co., Minneapolis, in all their bibliographies. THE INDEPENDENT contributes to the volume as many and varied titles as any magazine.

....Before the Rev. W. B. Selbie succeeded Dr. Fairbairn as Principal of Mansfield College, Oxford, he was pastor of the Emmanuel Congregational Church in Cambrdge. During the latter part of his pastorate he delivered a series of Sunday evening addresses on some of the urgent questions relating to the life of Christ. These with two or three other papers on the same subject are now published in a very readable volume entitled *Aspects of Christ* (Hodder & Stoughton; $1). Principal Selbie discusses first of all the relation of Christianity to historical fact, and particularly to the life of Jesus. He then proceeds to outline the conception of Christ presented in the Synoptics, by Paul, John and other writers. The author understands thoroughly the nature and difficulty of the problems involved, and he treats them with candor and decision, but the book can hardly be regarded as more than a popular apologetic on the subject.

....The third volume of the late Prof. Pfleiderer's *Primitive Christianity* (Putnam's; $3), published in the Theological Translation Library, deals with many subjects of first importance in the early history of the Christian Church. The influence of the Hellenistic philosophy, the Jewish apocalyptic writings, the religion of Mithra, and agnosticism receive careful and thorough discussion, and several parts of the New Testament, such as Hebrews, Ephesians, and Colossians, none of which Prof. Pfleiderer attributes to Paul, are analyzed and related to the thought movements of the time. A fine chapter is devoted to an exposition and a defense of the genuineness of the Ignatian Epistles.

....That the world is full of strange reversals in fortune is brought forcibly to mind by the career of the late Marcus Dods, preacher, lecturer, and professor. When now all his sermons and other writings are eagerly sought, it is hard for one to realize that for half a dozen years he was unable to obtain a pulpit and at times almost gave up in discouragement. The persistent effort, however, to compel recognition by sheer worth was richly rewarded by an unusual pulpit power and a large field of literary usefulness. Since his death Hodder & Stoughton have brought out two of his books quite different in character, but both bearing the stamp of his manly genius. *Footsteps in the Path of Life* ($1.25) consists of meditations and prayers for every Sunday in the year, and *Christ and Man* (1.50) is made up of sermons written largely during the later years of Dr. Dods' life. A sturdy, masculine quality in style and thought pervades both books, giving them the power of a spiritual tonic.

....The investigation of psychic phenomena gains rather than loses in interest under the spur of opposition, and any discussion of its results is sure to attract attention. In *Beyond the Borderline of Life* (Ball Pub. Co.; $1) Mr. Gustavus Myers gives a popular sketch of the rising tide of scientific study of the subject, culminating in the experiments with Eusapia Paladino. Mr. Myers incorporates with cordial approval a drastic criticism of Professor Münsterberg's exposé, written by Hereward Carrington, who brought Madame Paladino to this country. But since it has been repeatedly demonstrated in both Europe and America that she will cheat whenever she gets a chance, and since there is no known way of preventing her cheating, she is not worthy of further attention. Anyway she is no longer up to her old tricks, for since the American professors exposed them she has lost her power.

....In a New York courtroom, one Sandy McLean has confest that Jack London seems to have used him as the original of Wolf Larsen in the "Sea Wolf." The sealing part of it resembled some of his experiences in catching seals, he said, but added that he wasn't a "brutal, violent man," as Wolf Larsen was pictured to be. "I have never objected, because I have never met London since," concluded the subtle sea captain.

....Miss Laura Clifford Barney, who has devoted much time and effort to the defence and spread of Babism, or Bahaism as she would call it, in the western world, has sought to strengthen her propaganda by issuing an elaborate edition of a drama entitled *God's Heroes* (Lippincott), in which are set forth certain "episodes" in the early history of the movement, centering around the life and death of the far-famed Qurratu'l'Ain. Few dramatic elements and no traces of dramatic power are found in the production, and it would seem that some better form might have been chosen for presenting the history and dialectics. The book is decorated and illuminated in a truly oriental style, or at least in one that is not occidental.

....How many idlers have not fingered, along the Paris quays, copies of Brillat-Savarin's book, *The Psychology of Taste,* exposed for sale in the booksellers' boxes? The author of that work was a civil judge, and a hero of anecdotage. One day a hostess said to him:

"Monsieur the Counsellor, which do you prefer, Burgundy or Bordeaux?"

"Madame, that is a case in which I have so much pleasure in taking the evidence that I always postpone judgment," was the wily jurist's reply.

The revolutionary government confiscated Brillat-Savarin's property and removed him from office. He fled, first to Switzerland, thence to this country, and scraped a fiddle in a New York theater to gain a livelihood. Some of the maxims of this scholar among good livers are:

"The man who can cook is made; the man who can roast is born."

"To invite anybody to one's house is to undertake the responsibility of his well-being during the whole time he is one's guest."

"The table is the only place where one is not bored for the first hour."

....Richard Strauss, the greatest realist of instrumental music, the builder of orchestral skyscrapers, the author of the most distressing operas ever written, if not the foremost of living composers is at any rate the most versatile of them all. When he is not working on some new audacity of gigantic proportions he is writing songs—and such songs as no musician ever wrote before. He has produced something like five hundred *lieder* to date, and in them has proved himself a lyric poet of the highest rank. The first collection of, or, rather, selection from, these songs yet gathered has been made by James Huneker for the admirable "Musicans' Library" in *Forty Songs by Richard Strauss,* for high voice (Boston: Oliver Ditson Company; $1.50), a handsome volume that will find a ready welcome. It contains such favorites as "Devotion," "All Souls' Day," "Madrigal," "Why should we keep our love a secret?" "Waterlily," and many other surpassingly beautiful songs, but we miss the finest of all the Strauss songs, "Dreaming in the Twilight."

....In *Porcelain and How to Collect It* (Dutton; $2) Edward Dillon, an English expert, has produced a masterly little manual for beginners in the practice of a fascinating hobby. Aiming to set before the collector such elementary information as may aid him in identifying the examples of porcelain that fall into his hands, the author has kept the technical and historical side of the subject within strict limits, while describing and classifying the various kinds and grades of porcelain produced in the Orient and in Europe. Yet he not only gives specific information about many different classes of paste, glaze, enamel, decoration—on the differences of which the identification of the various wares depends—but he connects this information with its historical significance and relationships in such a way as to provide at least the groundwork for an intelligent conception of the general subject, and to create in the mind of his reader a desire for fuller knowledge. And it is all done in such an entertaining fashion, and the pictures are so many and so good that the little book is veritably (to borrow one of Mr. De Morgan's pleasantries) a *ceramicable* guide.

....J. A. F. Orbaan, D. Ph., is the author of *Sixtine Rome,* published by the Baker & Taylor Co. ($2.50). This is a handsome volume, copiously illustrated. "Sixtine Rome" is, of course, the Rome of Sixtus V. Dr. Orbaan's volume is a learned work, yet intended for you and the reviewer and every one else who would revisit the Eternal City more intelligently and with more zest than ever.

....Another book for the traveler is Corrado Ricci's *Art in Northern Italy:* a volume in Scribner's General History of Art. It is a beautifully made book—albeit not too expensive, and altogether portable. It is, moreover, stamped with authority. Signor Ricci is Italian Director General of Fine Arts and Antiquities, and he is respected wherever art is respected. His book has been well translated and is illustrated on almost every page. The occasional page illustrations in colors are exceptionally beautiful. Valuable as a work of reference, this volume is indispensable for the intelligent traveler in Tuscany, Lombardy, Piedmont, Emilia—the pilgrim to Florence and Milan and Venice.

....In his *Studies in the Sermon on the Mount* (Revell; $1) Dr. McAtee, of Brooklyn, gives a sane and practical exposition of Christ's teaching in that great discourse, and makes such applications of it as would be pertinent in the sermonic form.

....Undismayed by projected postal legislation, a new monthly magazine enters the arena this month. It calls itself *The Trend.* The issue for April has an appreciative article on "The Aldrich Plan for Monetary Reform," a "Friendly Hint for Suffragets," an article by Frank Hendrick inquiring whether American College Education "Justifies Itself" and somewhat doubtful as to that, reviews of the dramatic and operatic stage, short stories, a study of the problems of Government regulation of railway capitalization, etc. There is no particular novelty about the magazine's contents or aim, but a creditable showing is made. (New York; $1.50 per year; 15 cents per copy.)

....An autobiography used to be a biography *written by oneself.* There was always, of course, the possibility of a novelist writing an *autobiographical novel:* a novel illuminating in regard to himself, or conceived in the autobiographical form. Nowadays "autobiography" means simply a life, or romanticized biography, written in the first person. In this sense, L. C. Alexander, of Holly Lodge, Putney, S. W., is the "autobiographer" of William Shakespeare. This volume is nothing if not specific. It even tells just what books Shakespeare took with him to London when he "came up from Hoddingley"—some thirty of them. He fell upon lean times and sold them one by one and fed upon the proceeds, "and most sparely, too." Later, he played women's parts upon the stage; and took to writing certain plays on his own account. The "Autobiography" breaks off, none too soon, with the planning of "A Midsummer Night's Dream." There is ingenuity here, however; and any one in doubt as to the date of the composition of various plays has only to open this volume to learn the very truth. (*The Autobiography of William Shakespeare,* by L. C. Alexander. New York: Baker & Taylor Co.; $1.50.)

....George Ohnet's latest novel is disparaged by every critic—for it is good form to run down this long-lived best-seller. His novel is entitled *Pour Tuer Bonaparte,* and is based upon the Royalist conspiracy of Saint-Régeant, Cadoudal and Limoëlean to blow up the First Consul with an infernal machine. In this connection it is interesting to observe that, at the very moment when the French Senate preoccupies itself with the *soi-disant* heirs of the Bourbon throne, the Naundorff pretenders, there is a sensational hypothesis, defended by the learned M. Omersa, that the Emperor did not die at St. Helena—but at Schoenbrunn. Here is a summary of his case:

> An individual strikingly like Napoleon opened a spectacle-maker's shop at Verona shortly after the Second Restoration. He became intimate with a jeweler named Petrucci. In 1823, he announced that he was about to make a long journey, and intrusted to Petrucci a letter which he asked him to dispatch to the King of France, if he did not hear from him within three months. Petrucci carried out these instructions, was promptly visited by a French Government official, and was hushed by a bribe of one hundred thousand crowns.
>
> The records at Schoenbrunn contain, against the date September 23, 1823, this entry: "Last night an unknown tried to enter the park by climbing the wall. The sentinel shot him. The only words he was able to pronounce before he died were: 'Duc de Reichstadt—King—son.'"
>
> In 1808 Fouché, chief of police, alarmed by repeated plots against Napoleon's life, contemplated substituting for him, on state occasions, one Eugène Robeaud, a native of Baleicourt (Meuse), who resembled him closely.
>
> The town records of Baleicourt show that Robeaud died at St. Helena, English territory—and the date of the decease has been erased.

All of which furnishes M. Rostand with the chance to write a pendant to "L'Aiglon."

....Religious booklets vary much in quality, but the proportion of those of a high character is steadily increasing. From Eaton & Mains come *A Day with the Good Shepherd* (50 cents) and *The Song of Songs* (35 cents). The former contains many pictures and descriptions accurately depicting and illustrating shepherd life in Palestine, and in the latter Bishop Quayle discusses in his best style the literary charm and beauty of the great love lyric of the Old Testament. The Revell Company is sending out Rev. John Kelman's *Courts of the Temple* (35 cents), in which one finds wise reflections on the relation of religion to art, commerce and industry; *The Sons of Strength* (35 cents) by J. R. P. Sclater, who writes thoughtfully on Meredith's message to the Christian Church, and *The Friendship Booklets* (35 cents each) six in number, consisting of separate chapters from Prof. Hugh Black's winsome book on "Friendship." The Pilgrim Press has added to its long list a helpful Biblical and practical study of *The Way of Prayer* (50 cents) by Prof. McFadyen, the deeply religious essay by Dr. A. J. Lyman, entitled *Underneath Are the Everlasting Arms* (50 cents), and a glowing series of word pictures by Stephen A. Norton, in which he treats selections from Philippians as a *Call to the Heights* (50 cents). Two of the Pilgrim Press booklets deserve special commendation and a wide circulation, since they deal with real questions of the day in a vital and clear way. These are Rev. G. T. Smart's questionings and assurances suggested by the title *If I Should Meet the Master* (50 cents), and *A Man's Helpers* (50 cents) by Dr. Grenfell, wherein among other subjects prayer is discussed with a sincerity and out of an experience that will bring relief and help to many.

....Part 16 of Prof. Morris Jastrow's *Religion of Babylonia and Assyria,* translated into German and much enlarged, is received from Alfred Töpelmann, of Giessen, Germany. It reaches page 704 of the second volume, and is devoted to astronomical portents. It is expected that three more parts will finish the two volumes, giving us by far the most complete survey of the religious beliefs of ancient Babylonia. It is a matter of congratulation that the author is an American scholar from the University of Pennsylvania.

....Most reviewers sidestep verse altogether: for they are only too likely, in this utilitarian age, either to be callous to its music, or positively ignorant of the music that is there. THE INDEPENDENT prints a great deal of verse, reads a great deal, and occasionally gives its opinion of a book of poems. This last is a dangerous proceeding. Not to avoid danger, however, but only for want of space do we note in one paragraph the issue of several volumes of verse—Burges Johnson's *Rhymes of Home* (Crowell; $1); Emma Smuller Carter's *Lays of the Lake and Other Lyrics* (Revell; $1); George Randolph Margetson's *Songs of Life* (Boston: Sherman, French; $1); Thomas Durley Landeis's *Visions* (Sherman, French; $1); Agnes Lee's *The Border of the Lake*—some of the poems being reprinted from THE INDEPENDENT—(Sherman, French; $1); Lucien V. Rule's *House of Love* (Bobbs-Merrill; $1)—the poet being known for his "Shrine of Love," published in 1898; Max Ehrmann's *Poems,* now collected (Dodge; $1.50); *Forest and Town,* by the author of "Songs in Minority," Alexander Nicolas De Menil (The Torch Press; $1.25); Howard V. Sutherland's *Idylls of Greece* (second series)—one of the few volumes of classical inspiration, on our present list (Desmond Fitzgerald, Inc.); Charlotte Williams Hazlewood's *Garden of Gray Ledge* (Sherman, French; $1.25); Elizabeth Toldridge's *Mother's Love Songs* and Gazelle Stevens Sharp's *A Little Patch of Blue,* both published by Mr. Badger; Ellen M. H. Gates's *To the Unborn Peoples* (Baker & Taylor); Anna Hempstead Branch's *Rose of the Wind* (Houghton; $1.25); Emily Sargent Lewis's *Little Singer and Other Verses* (Lippincott; $1). From the last named volume we quote these apt lines:

"My pipe is but a slender reed,
My numbers halt, my fingers grope,
But like your own, my spirit's need
To voice its passion and its hope."

We are impressed by the fact that more and more volumes of verse are published in America, and that more and more does the American inspiration, as opposed to the cosmopolitan, prevail here. More and more does the native scene suffice, for poet as well as for playwright and novelist.

Pebbles

'ARF a hinch, 'arf a hinch,'
'Arf a hinch honward,
'Ampered be 'obble skirts,
'Opped the "400."
—*Dartmouth Jack o' Lantern.*

MANAGER OF COMMONS.—Yes, nothing goes to waste. What is left over I make into hash.

Student.—But suppose some hash is left over?

Manager.—I re-hash it.—*Columbia Jester.*

HERE is a pretty quibble from the new edition of "Logic for the Million," which Sharper Knowlson has prepared:

David said in his wrath, All men are liars.
Therefore, David was a liar.
Therefore, what David said was not true.
Therefore, David was not a liar.
But if David was not a liar, what he said was true, namely, that all men are liars—*New York Globe.*

A SCOTTISH woman, who was spending her holidays in London, entered a bric-a-brac shop, in search of something odd to take home to Scotland with her. After she had inspected several articles, but had found none to suit her, she noticed a quaint figure, the head and shoulders of which appeared above the counter.

"What is that Japanese idol over there worth?" she inquired of the salesman.

The salesman's reply was given in a subdued tone:

"About half a million, madam. That's the proprietor!"—*Argonaut.*

CANADIAN RECIPROCITY.

On the old White House veranda sat Fielding and Philander,
While Taft stood smiling by.
Said Philander unto Fielding: "You are on the point of yielding,
For a tear-drop dims your eye."
"They're not tears of woful sadness; they are tears of joyful gladness;
Firm free-trader I've been right along,
But I've never had a chance, sir, to make the interests dance, sir.
That is why I sing this song."

Chorus—
Put on my free-trade bonnet, with the red ribbons on it,
While I knock the tariff wall away;
For a cheaper dinner may be found a winner
On the next election day.

Said Phillie unto Willie: "This question may seem silly,
But it's needed on the whole.
Could you stretch another point, sir? Pray, do not disappoint, sir;
On the free list put soft coal."
Fielding smiled a smile seraphic, then he said in language graphic:
"Knoxie, dear, I fear you do not see
I'll hit fruit men and packers, but it's hands off coal and crackers,
That's true reciprocity."
—*Montreal Gazette.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Appeal of Peace to the Senate

PRESIDENT TAFT has assumed the leadership in the peace movement of the world. He proposes that the two great English-speaking nations shall hereafter settle all their differences by law instead of war. At this very moment Secretary Knox and Ambassador Bryce have almost completed a treaty to this effect. It will shortly be sent to the United States Senate for ratification.

President Taft has nailed his colors to the mast. If he holds fast to his great ideal he will win. The people always follow genuine leadership. If he compromises, if he swerves a hair's breadth from his high resolve, all is likely to be lost.

Twice before have arbitration treaties with Great Britain been rejected by our Upper House. This time, however, the Senate must ratify. The time is ripe. The enlightened sense of mankind is impatient for action. All England is aroused with enthusiasm and in a state of most acquiescent receptivity. Japan and France are ready—even anxious—to negotiate similar treaties with us.

The responsible leaders of our Republican and Democratic parties have committed themselves to this great peace pact. Already the ground swell of what promises to be an overwhelming wave of popular enthusiasm is arising all over the country.

It now behooves every good American to exert whatever influence he possesses to assure the passage of this great treaty. Memorials and petitions should be addressed to the Senate. The State legislatures should pass resolutions. Mass meetings should be held in all our cities. The churches, civic organizations, chambers of commerce, labor unions, law associations, women's clubs, etc., should agitate. Individuals should deluge the Senate with letters and telegrams.

It is a disgrace to our Senators that they should seem to need any urging in this moral crisis. If the treaty now fails, however, the whole peace movement will be put back a generation. Then all the cynical forces of reaction will become supreme, while the mad and ever madder emulation in armaments will continue, until the end comes in bankruptcy or revolution.

The people of England are ready. The people of the United States are ready. Will the Senate this time block the way?

The English Bible

ALTHO the English-speaking world is just now celebrating the three hundredth anniversary of what is usually called the English Bible, there is nothing more sacred about it than about any other version. It is King James's and not St. James's; and King James's name adds no sanctity to it. But it is a fine version, for its day, and its influence has been immeasurable for religion and character, and, what is of some importance, for the conservation of the English language. Our English speech cannot get far away from the words, forms and idioms of the Bible which every one knows. Shakespeare has done much to fix our speech, but the accepted Bible has done a hundred times more.

Yet while the English Bible is just now being so much lauded as a pure well of English undefiled, let it be ever remembered that its great service is still

and has always been that it has been the medium by which both the Christian religion and the moral duties which it has inculcated have been imprest on the minds of the peoples who have spoken its tongue. From it they have read and learned the Ten Commandments. From its prophetic denunciations thousands of preachers took the texts from which they have arraigned the guilt of slavery, drunkenness and oppression of the poor. In its words generations of children have learned the Golden Rule. It has taught them "In the beginning God," and of the Word who was in the beginning with God. If there is a certain standard of recognized personal and social duty, praised, accepted, and the failure to reach it condemned by public censure, it is the English Bible which has made the standard. So sacred has the inspired Word been held to be that the very words of our old English translation have been regarded as too sacred to be used lightly, and its very style has become a standard of speech, beautiful and stately and musical, because we have from our childhood attached to its words something of the virtue of the inspiration back of them.

Doubtless the Bible is less read than it was in the days of our grandfathers, when newspapers were few, and there were no magazines loading their tables, and the Bible was almost the only book in the house; but even yet it is the one book which is more quoted, more known, than any other book or all other books in the language. Read any essay, read any speech of scholar or statesman, and more than half of the quotations and allusions will rest on our English Bible. The speaker may be little of a religious man, but he has absorbed from the social atmosphere so many Bible terms and facts that he cannot help using what has come to be of the very web of common speech.

They tell us that King James's version is antiquated, obsolete, that people do not read it, because it is not written in the vernacular of Mark Twain. There is some truth in this complaint. The language was properly dignified in its day; it never had the slang of Shakespeare's plays; and yet something that was colloquial then, with its *thees* and *thous*, has now become unfamiliar except for the solemn use of prayer. Also the absurd splitting of the paragraphs into verses disfigures the page and obscures the connection and sense. By this time the version whose tercentenary we celebrate is getting a little old-fashioned, and for some it should be put into a more vernacular idiom; while a better knowledge of Hebrew and Greek will provide for the correction of many minor errors. In part this is supplied by the Revised Version and the better American Revision, and that ought to satisfy those who love the ancient dignity and yet do not worship the letter. The objection to the Revised Version is most unreasonable. It is worthy of those only who have the notion that the Bible was written originally in English, or that it was, as in the myth of the Septuagint, written by seventy translators, who were put to the work in seventy separate rooms and who all of them made the same version word for word. Our fathers we venerate; we cherish them to a good old age, but before they are a hundred years old we bury them in their graves; the King James Bible has lived three hundred years, and it is time it be put away with affectionate regret, and that it give place to the best revision; and that is the American Revision.

But for those who have not learned the beauty of dignified speech it is well that the Bible story is also translated into most unconventional speech. Its Greek and much of its Hebrew was written in the tongue of the common people. The Gospels, at least three of them, are not in literary style, nor were the Epistles of Paul. They were very direct and homely. This is not true of the Prophets and Psalms of the Old Testament, which were composed in the highest formal style, even reaching poetic structure. That style we would have always maintained; but the historical portions of the Old Testament, and pretty much all the New, can very well be read with profit by children and ignorant people, and even by some educated people, in the familiar speech of the street. Such translations we have, and they are just as sacred as any other.

even Coverdale's or Tindale's. They will tempt the child to read the Bible as he would any other story, and the moral and religious truth will be made more attractive because the familiar words will quicker reach the heart without verbal obstruction.

The Old English Version, which was new in its day, and had to win against versions older yet, has lived long enough, and should give place to those that are truer and better. We do not believe that the Bible is superseded. It is not read enough, and it never was. We have published accounts of the ignorance of the Bible in schools and colleges, and shall do it again; but yet the Bible is far the best seller in the market. It is printed in nearly all languages, and no other book, even of novels, is read so much and known by so many. To the Old Version in this tercentennial celebration we would give stately burial, enthrone its successor, and say, "Long live the king—but not too long." Let us love the Bible for its sense and substance, not for its sonorous dignity. Never let it become an antiquity. It is for the life of this generation and its voice must be familiar to the people of today.

Reciprocity Should Be First

In the program approved by the Democratic caucus, for legislation during the special session, the passage of a resolution for the direct popular election of Senators stands first. This is followed by a bill requiring publicity for campaign funds before election. Favorable action upon both of these legislative projects should be taken. There is reason to expect that the Senate, as now constituted, will give the needed vote for the first, and there ought to be a majority in the Senate for the second. Probably neither of them will consume much time in the House.

But they should not precede the reciprocity agreement with Canada. This, which has the third place in the program which the caucus approved, should stand first. Before taking up any other question the House Democrats should pass the Canadian Reciprocity Bill, and should send it to the Senate without any amendments. The session was called by the President to act upon this agreement with Canada. When they were a minority, the Democrats, only five excepted, voted for it. They should now begin the special session by voting for it again. If they should attach to the bill any tariff revision projects they would probably thereby give the opponents of reciprocity in the Senate an excuse for obstruction. But if they should send over the reciprocity agreement, standing by itself, they would clearly place upon the Senate (with its Republican majority) responsibility for the fate of the measure. Senator Cummins intends to propose amendments enlarging the free list so far as imports from Canada are concerned. The House Democrats ought not to assist him. If his amendments should be adopted, Canada would reject them. Other nations, under the provisions of existing treaties, could justly demand an extension of the amendments to cover imports of their products, and Canada would enjoy no advantage. The agreement as it stands should be approved.

We understand it has not yet been decided whether tariff revision shall follow or shall precede action upon the reciprocity bill. In the program the two subjects are placed in the same paragraph. It is expected, however, that revision of the wool and woolens schedule, at least, will be taken up first. This would be unfortunate. Such action would probably imperil the reciprocity bill. The schedule in question ought to be revised, but the reciprocity bill should come first. Democratic revision of this schedule, involving a reduction of nearly one-half (as now proposed) will provoke long discussion in the Senate. This discussion, with the complications that will accompany it, should follow, not precede, action upon the important agreement which the President asks Congress to consider and approve. The Democratic majority in the House will not be content with a revision of the duties on wool and woolen goods. It will attempt a revision of other duties. All this revision should stand by itself, and approval of the reciprocity agreement should precede the beginning of it.

The Efficiency Program

THE most significant thing about the efficiency movement is the date of it. There is nothing new in the ideas that are being ingeniously and well worked out in shoveling, bricklaying, handling pig iron, and a hundred other occupations. Many of the details that are interestingly presented by Frederick Taylor in his magazine articles, and in various other discussions of the subject, are of course new. They have come out of actual experimentation. But whenever the experiments described by Mr. Taylor and others are the subject of conversation in any group of interested men, nearly every one participating recalls the preaching of essentially the same gospel by various "impracticables" and "idealists" a generation or more ago.

To give a specific instance, an interesting book called "Ten Acres Enough" was published in 1864. Its author—we remember his name as Morris, altho it did not appear on the title page—had been a business man in Philadelphia. From considerations of health and family welfare he had taken up truck and fruit farming at Burlington, N. J. From cover to cover the book was an exposition of essentially the same ideas of efficiency that now are no longer "in the air," but are undergoing realization. The author, for example, tells how he amused and scandalized the neighbors by arming himself and each of his boys with a file, for the purpose of keeping the edge of the hoe sharp when working among the strawberry vines and raspberry bushes.

The efficiency idea did not "take" and begin to transform industrial methods in America a generation ago or at any earlier time for the very good reason that an efficiency program was not then on the whole worth while. There was a virgin continent to lay waste; and every year brought new devices in labor-saving machinery and the substitution of physical energies of nature for human strength. Nobody troubled his head much about the efficiency of labor so long as he could move from the boulder-strewn farms of New England to the black earth wheat lands of the prairie belt, or so long as he could depend on the progressive evolution of cotton spinning, iron and steel making, railroad building, electric equipment, and all the rest, offering opportunities beyond the dreams of avarice for the investment of capital.

The fact that a program of efficiency, familiar in the higher grades of employment, as superintendence, office work and the like, is now being carried into the crudest operations of physical labor is the most significant indication imaginable that the economic opportunities which created a generation of multimillionaires have begun to yield "diminishing returns." The cream has been skimmed off the pan of our natural resources, and it is highly improbable that discoveries in physical science and new mechanical inventions will ever again so enormously expand the field of man's industrial operations, or so amazingly multiply his power, as they did in the nineteenth century. A woman with a distaff in the ancient days could possibly have spun, year in and year out, a mile of thread a year. The cotton spindles of the world now produce a hundred and ninety billion miles of thread a year. All the planets of the solar system would not afford decent dwelling room for the human beings necessary to produce, by the old hand methods, the present annual output of cotton fabrics alone, to say nothing of iron and steel, and a million or so of other convenient things.

But all this raises another question, What part of the human race has profited by the substitution of spindles for the distaff? Certainly not the child laborers in Southern mills. Certainly not the victims of the fire horror in a New York shirtwaist sweatshop a few days ago. What part of the human race has chiefly profited by the applications of physics and chemistry to steel making? Surely not the workers, whose appalling living conditions shocked and disgusted the civilized world when they were for the first time truthfully described in the volumes of "The Pittsburgh Survey."

Mr. Taylor tells us that by the substitution of "scientific" shoveling in the yards of the Bethlehem Steel Company for old happy-go-lucky ways the number of yard laborers was reduced from between 400 and 600 to about 140. The average number of tons shoveled per man

per day was increased from 15 to 59. The average earnings per man per day went up from $1.15 to $1.88. And the average cost of handling a ton of 2,240 pounds was decreased from $0.072 to $0.033!

Here you have the philosophy, the program and the outcome of scientific management in a nutshell. It is the same old philosophy, the same old program, the same old outcome that have made glad the heart of your true "economic man" from long before the days of Ricardo until now. Everybody is made better off, but the gulf between those who get little and those who get much is once more widened and deepened by the arithmetical difference between the ratio of 1.15 to 1.88, on the one hand, and of 0.072 to 0.033 on the other hand. Figure it out for yourself, and ask how long human society can continue to be coherent, fraternal and democratic on the basis of that arithmetic. The pretense that the diminished cost of production benefits the consumer no longer deceives anybody. It may have done so in the days of competition; it does not under the regime of combination and monopoly.

Efficiency we must have. The human race has been a waster long enough. Scientific management we must have. Nothing less will do. But who shall the beneficiaries be? This question will have to be answered.

The Secret of Impressionist Art

Artists are supposed to have better vision than ordinary persons. They can see soul where we see mere skin. They can detect the picturesque in the ugly. They demonstrate the ideality of sordid reality and make us perceive the admirable in the commonplace. But we suspect that not all of those who lay claim to the title of artist, and are so accredited by those who claim to know, possess the gift of clairvoyance. From our tramps thru recent exhibitions we have reluctantly come to the conclusion that myopia and other defects of eyesight are increasingly prevalent among modern painters. In fact, it seems as if anybody who has abnormal eyesight and can prove it to the world is acclaimed as an artist. If his abnormality is sufficiently pronounced and if he can make it sufficiently conspicuous he may become the founder of a school, and hundreds of disciples and thousands of admirers will train their vision to accommodate his defect, just as all the courtiers of the lame king cultivated a limp.

There is a story told of Whistler—if we remember right it is No. 3742 in the collected sayings of "the Master"—about a man who, gazing upon an unconventional landscape, ventured to question its naturalness. "I can't see it that way," he said. "Don't you wish you could?" retorted the Master. Every innovator nowadays thinks himself entitled to make use of the Whistler retort, but he is not, for the reply to it in many cases is obvious. We can very easily see the world as some artists see it, because any congenital defect of sight can be imitated or acquired. Often all that is necessary is to use colored spectacles or look cross-eyed.

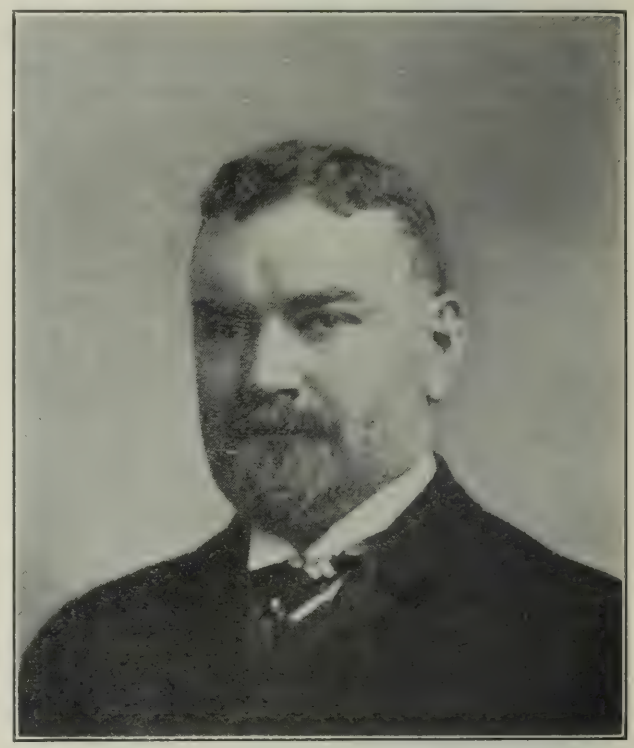
A work of art, we are told, is nature seen thru a temperament. But according to our observation the artist's gift is more apt to be a tint than a temperament. We can get the same effect by looking at a landscape thru red, yellow or purple spectacles, and this is cheaper than buying pictures and less trouble than going to see them on free days. We do not mean to say that these colorists use glasses or gauze veils. They probably are affected with congenital erythropia, xanthopsia, or porphyropsia. This is incurable, whereas we, whenever we get tired of a rosy, jaundiced or purplish world, can take off our spectacles and see things under their more ordinary and less interesting aspects. One of these monochromatic canvases might get tiresome on the walls of a living room. We suggest that it would be better for the painter to use natural colors and then sell with the pictures a set of gauze screens which could be hung over the front of the frame and changed as often as desired. The magazines, by the use of tint-block backgrounds, get the same result as these single color interpreters of nature.

Much more common optical defects than color vision or color blindness are

the errors of refraction or accommodation. This is so common among modern painters that one might almost define the artistic temperament as one that is perpetually out of focus with the world of today. Not long ago a group of American photographers aspired to be called artists on the ground that they, like the painters, could depict the soul of the sitter. They had a monopoly of the new art until their secret was disclosed. They simply unscrewed the front lens a bit. Now any country photographer will take your soul picture at $3 a dozen. The conventional idea of the soul is a somewhat enlarged and hazy body, and this enlargement and haziness may be attained by the loose lens trick.

A person whose intellect is a trifle unscrewed may be taken for a genius if he is not taken up for a lunatic, but in the case of modern art we are inclined to think the intellect is not involved at all. The eccentricity seems purely visual. Anybody who is myopic or crosseyed will see things in the superficial, indefinite and hazy way that many artists do, and to him the pictures painted with discreet spots of primary colors will appear altogether normal. A person of ordinary vision standing close to such a picture can hardly discover the design because the spots refuse to fuse. But if he backs far enough to get out of focus, the colors blend and then effects of astonishing vividness and brilliancy are obtained. But sometimes no gallery is large enough to harmonize the polychromatic individualism and the picture remains anarchic so long as it remains in sight. In such a case the only way to get together the colors that the artist neglected to mix on his palette is to stand before the picture and look at the end of your nose instead of the canvas. Very likely that was the way the artist painted it.

In magazine work, a color print in which the colors slop over so that every green has a little yellow on one side and a little blue on the other, is regarded as a failure and thrown into the waste basket. But when magazine readers are educated into the ideals now prevailing in the ateliers, these misprints will be valued. Imperfect registration in color printing will then, like imperfect focusing in photography now, be regarded as an indication of artistic taste. Thus the failures of one generation become the admiration of the next, and true art ever expands and adopts new methods. In one of the paintings accepted by the jury and exhibited on the walls of the impressionist salon in Paris last summer, genius had been entirely replaced by ingenuity. It had been painted by tying a brush to a donkey's tail and backing him up against a fence on which a canvas was tacked. A palette held within the swish of the tail supplied the color. There was great indignation among the other artists whose work was exhibited in the salon, at this disclosure, and with good reason, because it brought the most advanced form of art within the reach of any one who could hire a donkey for a few minutes. So it is with all the forms of art that depend upon artifices of discoloration or deformation. A little knowledge of optics spread among the people will teach them how to look at the most extreme of modern pictures so as to bring a semblance of reality out of it, or, conversely, how to see the world about them as the artist sees it.



A New Constitution

It seems an academic question which Edward L. Andrews propounds in *The Forum* in his argument for a national constitutional convention. Our present Constitution, he says, needs something more than amendment—it needs remaking. He would have a new one which shall recognize the new civilization, the new national spirit and the new national obligations. Beyond all question we need amendments, but it is not so clear that we need a new Constitution; and if we do need one it seems impossible to get one thru a constitutional convention. We admit, for example, that a Constitution needs amending which, as the United States Supreme Court has decided, does not allow Congress to pass a law imposing an income tax. Equally the decision last week of the New York Court of Appeals that the Fourteenth Amendment—that amendment that covers so much more than it was ever intended to—forbids a law providing that workmen in danger-

ous businesses shall be paid for accidents they suffer, shows the need of amendment. But what chance would a brand new Constitution have of being accepted? The convention would have to be called by two-thirds of both Houses of Congress, or two-thirds of the State legislatures; and then the Constitution must be accepted by three-fourths of the States. Let us imagine a constitution offered to the country which provided, as Mr. Andrews said it should, that the Federal Government shall have control of all elections to Federal offices. Have we not now seen that an amendment to that effect has just killed in Congress a proposal to elect Senators by popular vote? We can imagine a condition in which a convention to create a new Constitution would be necessary. If, for example, fifty years from now the continent were so far civilized that it wished to make one nation out of all North America, that would require a new Constitution; but at present the slow process by amendment is the only practical one, and it should be prest.

A New York Senator

When the Democratic insurgents in the New York Legislature threatened to accept the offer of the Republican members in electing such a Democratic Senator as would be agreeable to the anti-Tammany Democrats, Boss Murphy came to terms with the insurgents, and the Democratic members all united on Justice O'Gorman, of the City Supreme Court, who is a very worthy man, altho he is a member in high rank in Tammany Hall, and is, we judge, personally quite as agreeable to Mr. Murphy as is Mr. Sheehan. So the election of Justice O'Gorman is but a half victory for the insurgents and perhaps more than half a victory for Mr. Murphy. He keeps his leadership in the city and State. He has stood stubbornly by the party's candidate, Mr. Sheehan, even beyond what seemed possible; and when he had to yield he yielded only a little and holds his mastery in the party. The attempt to down Tammany has proved a failure. Against Justice O'Gorman there is no personal objection. He is a capable lawyer and judge and a courteous gentleman, and will add strength to the Senate. In the contest in the Legislature the Republicans lost nothing and perhaps gained a little by their offer of coalition, and they made certain the election of a reputable man as Senator. It is worthy of mention that while the weeks of weary and ineffective balloting for Mr. Sheehan were going on a hasty bishop publicly complained that the reason why the foes of Tammany would not vote for Mr. Sheehan was because he is an Irishman and a Catholic. But that was the outbreak of a suspicious mind. Justice O'Gorman is

SENATOR O'GORMAN.

what his name suggests, and he is a member of half a dozen Catholic and Irish societies.

Dr. Jowett

With the utmost cordiality would we welcome Dr. Jowett to the American pulpit. Ever the stars move westward. Dr. Hall, Dr. Ormiston, Dr. Taylor, Dr. Aked and now Dr. Jowett, and just now Dr. Aked moves farther west. No British clergyman is more honored and admired than has been Dr. Jowett, and the Fifth Avenue Presbyterian Church of this city is happy in having secured him as its pastor. Last week he arrived, and not a day's delay was allowed before the presbytery met to admit him to its membership, the leader of British Congregationalism to be made pastor this week of the

leading Presbyterian Church in this city; so low is the wall that separates the two denominations. But such transfers are an old story. Dr. William M. Taylor, Presbyterian, came here to become pastor of the Broadway Congregational Tabernacle, and just now Dr. Aked, in crossing the continent, drops his Baptist for a Congregational fellowship. These denominational differences are of the smallest value. Ministers and members cross the lines freely for convenience or service, and ought to. They are all in the same Federal Council of Churches. These walls are so low that in many cases they ought to be removed altogether; their removal is a chief duty of our denominations. We note that on his record the presbytery received Dr. Jowett and asked him no questions beyond the formal constitutional ones. No one feared that he might be importing heresy; and yet this is the presbytery which has been arraigned for admitting for license or ordination younger men of modern views. But there is no danger of heresy from Dr. Jowett. He is a preacher rather than a propagator of novelties. He is one to edify and not to disrupt or distract.

Southern Immigration

Georgia has population enough and wants no immigrants. So declares unanimously the Farmers' Union, which has 80,000 members, and which held a convention in Atlanta not long ago. Negroes, they say, are infinitely preferable to the foreigners who would be brought in to take their place and to take the place of white farmers and white workers in the factories. Immigrant labor would, they think, lower wages and depress the price of cotton. To be sure the price of cotton is so high now that Great Britain and other countries are doing their best to increase the supply from other countries, and the danger to the South is that the practical monopoly which the South has enjoyed will be lost before very long. The Northern States have welcomed immigration and profited by it immensely. All productive industry is a source of general profit to the community, and the Georgia farmers are not wise when they fear it. It is the narrow view which we see exprest too often in the more populous States, when labor unions would limit membership for fear that the present members may be thrown out of employment. The Georgia farmers tell the legislature that it must make no appropriation to bring in foreign labor. This is a different policy from that which has been taken by South Carolina, which has sought immigration so as to reduce the preponderance of the negro population.

Boys in Reformatories

Room for improvement in the treatment of juvenile offenders is suggested to us by a chaplain at Hart's Island, in New York harbor, who has added this work to his busy life, not for the $400 or $500 a year, but out of a real desire to help the boys committed there. Why should it be that this service is so often taken up by played-out clerics, who have no ability and can do no good, instead of its taking a half day in the week of the time of really able and successful clergymen, who very likely might do as much good as in ministry to well-to-do families? If a bright minister will enter into the feelings of these boys he will get their confidence and can save many a young lige. There are some twenty epileptics confined at Hart's Island, and they ought not to be there; they should be treated at home, or committed to an epileptic farm. Parole boards ought to have the right to review sentences to the reformatory when cases are deserving and causes of commitment trivial. Here is the actual case of a boy who has been treated for epilepsy for seven years, committed for a small theft so well explained that his employer was willing to take him back, yet the magistrates would not suspend sentence. Here is another case of a boy not found guilty of actual theft, but arrested on suspicion because in company with a pickpocket. The father, in whose low saloon the boy has found his training and companions, says he will have no responsibility for him, which is no loss to the boy; but it illustrates how many boys go wrong because they have no parents fit to train them. For such boys, many of whom can be reformed, the "big brother" is needed; one good man who will undertake to interest himself in the boy when paroled or discharged, will give him ad-

vice and help, and make a decent citizen of him. There is great room here for good chaplains and more "big brothers."

Pagan Polygamy

The Congregationalist calls attention to an old and sore subject, the duty of Christian teachers in the case of converts living in lawful polygamy. It is also a difficult question when our Government meets it in applying our laws to the Indians. The case of the late chief of the Apache and Kiowa Indians is thus given. The Government had determined to abolish polygamy and required him to put away all but one of his wives, and this was his reply:

"Mr. Commissioner, it is your wish and your order that we Indians have only one wife. Mr. Commissioner, I have six wives. I have married them all, according to Indian custom. I love them all. They all have children. They have been with me many years, and we are very happy. I am willing to obey your orders. I have obeyed all your orders, and I will obey this one, but, Mr. Commissioner, there is just one favor I would ask of you, just one little favor. You must select the one I am to live with. Then you tell the rest."

The Commissioner did not like the job put up to him and he let the old chief live out the remnant of his life without disturbing his domestic relations. We remember another more tragic case. An Indian had two wives and was required to dispense with one of them. One was old and the other young. The old woman said it would be harder for the young woman to be thrown off; so she voluntarily withdrew and set up a tepee alone. Thus in the interest of public morality a cruelty was imposed such as the early Christian Church did not require of its converts.

The Situation in Mexico

The uncompromising attitude of the Mexican revolutionist leader and of his agent at Washington does not indicate that a peace agreement will soon be made. Madero's father and brothers would be glad to see peace negotiations in progress, but it is evident that he would not be satisfied with concessions which they might regard as sufficient. They have not hastened the coming of peace by talking so freely about their conferences with Limantour, who now appears to realize that they neither deserved his confidence nor could understand how difficult his task will be. He must proceed slowly, with due regard for the pride of Diaz. The latter's outline of projected reforms, in his message, was somewhat vague, but probably he could not be induced to make it clear and distinct at the present time. Despite its vagueness, however, it is virtually an admission that a majority of the revolutionists' demands are just. The new Cabinet Ministers should now without delay formulate plans for the proposed reforms. It may be that by such action they cannot satisfy Madero's followers in the North, but they should have in mind those complaining "non-combatants," whose disapproval of the Diaz Administration surprised Limantour upon his return to the capital.

British Opium

British opium is raised in India and is consumed in China, to the enormous injury of the Chinese people. But the poppy is a source of great profit to the Indian Exchequer, and India, and Great Britain, are slow to lose the profit of it, just as the Russian Government rejoices to make a profit out of the besotting of its people by vodka. Now China has long seen the evil and has tried to put an end to it, restricting the cultivation of the poppy in its provinces and forbidding the use of the drug. There is a convention between China and Great Britain on the subject, only about two years' old, under which China cannot forbid the importation from India, and the British defenders of the commerce in opium declare the Chinese are not serious in their effort, but are making it a part of an anti-foreign movement. We remember the Opium War with China, and cannot doubt the genuineness of the campaign against this greatest of evils. There is in Great Britain a growing sense of the shame of the British policy of forcing vice on the Chinese. It is a case in which the so-called pagan people is more Christian than the so-called Christian people. At present in the counsels of the new Chinese Senate it is the opium reform that has occupied the chief discussion. It is hard to believe that the Liberal Government of Great Britain, with its Dissenter

conscience, will not give its help to China, or why send missionaries?

Justice for Brazil

Some time ago we suggested that the sudden death in a Brazilian prison of the naval mutineers suggested governmental perfidy; for they had been pardoned by act of Congress. Mr. Myron L. Clark, the General Secretary for Brazil of the Young Men's Christian Association, writes us:

"Permit a word of explanation. There were two mutinies, one on November 23d, and the other on December 10th. Full amnesty was voted by Congress on November 26th or 27th to those who had taken part in the first revolt of the ships "Minas Geraes" and "Sao Paulo," and steps were immediately taken to disarm them. When the second revolt broke out in the naval battalion, on Cobras Island, these vessels were prevented from taking part only because the breeches of their guns had been removed. The officers were again driven from the ships, and admittance refused to those who were on shore at the time; the ships moved about in a hostile attitude, and constant telegrams were sent to Government requesting restitution of the breeches on the ground that they were being threatened (!) by the rebels on the island. Consequently those men had forfeited their amnesty, and really merited severe chastisement.

"The sudden death of numbers of them in the cells after their imprisonment was of course an act of unjustifiable barbarity, but in justice to the Government be it registered that the commandant, Marques da Rocha, was at once removed from office and ordered to respond to court-martial, which court-martial is still in session.

"Hence there certainly was no perfidy on the part of Government or of people, for the sad event was deplored and condemned on all hands."

This clears the situation.

Prison Reform

Chaplain Herrick, of the State's Prison at Auburn, N. Y., is telling some of his experiences during the last fourteen years. Certainly the progress made in State's prison discipline is very satisfactory. Fifteen years ago the first thing done to a prisoner was to clip his hair and dress him in stripes; but now he can wear his hair as he pleases, and the striped clothing has been displaced with suits of gray. The lock-step with which the men were taken to and from the shops has been displaced by the military march, and with this they are given a half hour drill in the forenoon and another in the afternoon. Fifteen years ago a prison school was in operation, and it accommodated about twenty-five prisoners. A few years ago the State furnished a schoolhouse large enough to accommodate 550 students. Any prisoner who desires it can get a good education, and he has time for doing it. Even the classics are taught by the better educated prisoners, so that no high school could furnish better advantages. There is a large library in the prison for those who care to study along such lines as electricity or engineering or horticulture. The men not only are compelled to work, but are expected to study in the trades, so that when they leave the prison their earning capacity will have been considerably increased by their detention. There has been quite as great a change in the method of imparting religious truth. Doctrinal matters are left out altogether, and Jesus is made known to the prisoners as a brother, while the whole brotherhood of man is emphasized. The chaplain affirms that he personally knows of over 100 men converted to practical Christianity while in prison. The inhuman methods of punishment are all done away with, and the men are treated as human beings, and the prison in general is considered a place for betterment rather than for punishment.

That the calendar of months and days is very imperfect goes without saying, but the attempt to correct it is difficult enough. They tried it at the French Revolution, but it was a failure. If we could have all the months of the same length and all begun on the same day of the week, that would be fine, but the numbers 30 and 365 are not commensurate. The proposals lately made to put an extra day in the week once a year, or two in leap year, and so begin every three months with the same day, are evidently made with no regard to the stubborn religious prejudices of both Jews and Christians. They will have no eight day weeks. It would be very nearly as easy to correct the evil by shortening the year or lengthening the day.

Lives are much more valuable than records, and yet, somehow, when a hundred die in a fire like that the other day in this city, or a thousand in an earthquake, or regiments in a battle, the ranks

fill up, and only the near relatives feel the bereavement. The workers are all replaced. But when historical documents are burned it is an irreparable loss, unless their record has been preserved by printing. The first lesson is to make life safe, and that is what we should put our chief effort to accomplish; but next comes the duty of making safe the records of history. There have been not a few appalling losses of manuscript treasures since the burning of the Library of Alexandria, such as that of the old Parliament Houses in London in 1834, the burning by the British of the Capitol at Washington, and the burning twice ot the Capitol at Harrisburg. The fire at Albany was utterly inexcusable.

This is what the London *Times* says in an editorial on the "ankle skirt," also less happily called the "harem skirt":

"If this question were merely or mainly one of reason, common-sense, comfort, convenience and hygiene there would, we apprehend, be very many of both sexes who would not hesitate to answer it in the affirmative. But reason, common-sense, comfort, convenience and hygiene have, as we know, very little to do with the capricious dictates of fashion. Nor have considerations of comeliness and seemliness very much more to do with them. . . . It certainly does seem to us that there is not a little to be said for the ankle-skirt on the prosaic and utterly non-fashionable grounds of common-sense, convenience and hygiene, while there is not much, if anything, to be said against it on æsthetic grounds. We know no reason why it should not be made just as comely and as seemly as any other kind of skirt."

Shall the world's final script be Roman, such letters as we use, or Arabic or Chinese? The Roman script has by far the best chance and the best claim. Efforts are making to introduce it in China and Japan, and now the effort is making to interest India in reducing its fifty alphabets to a single one. In the 200 languages of India there are only about sixty-three separate sounds, but it would take some 20,000 characters to represent them in print, as so many are syllabic. But, before a Roman alphabet can be adopted, it should be reformed. Simplified spelling is good and can be greatly extended, but a scientific alphabet, made by international conference, is of the first importance, to perfect what is called the missionary alphabet.

Can it be that Cardinal Ferrari, Archbishop of Milan, is a Modernist? That is the charge made against him by an Italian Catholic journal of the extreme type, more Papal, if possible, than the Pope; and it further charges that the Cardinal Archbishop's seminary is the hotbed of Modernism. That depends on what Modernism is; for we suspect that in this case it means a readiness to accept political conditions in Italy and Rome, and to accept with silence the loss of temporal dominion, and the acceptance of the authority of the king over what were the Papal States. Even that may well be Modernism, for it opposes the claims of Pius X.

Russia is worse than ever. She has inaugurated a new persecution of the Jews, forbids their children to be educated, and drives them by the hundred thousand out of the country. She is treating China with parallel brutality, making a two days' ultimatum in threat of invasion, and compels submission because China cannot resist, with no time or chance for arbitration. But in twenty-five years China will be able to resist, and then let the nations look out which have coerced the most populous nation in the world.

That is an extraordinary appeal which the Persian Government now makes to the nations of the world. It says that four years ago it entered on an effort for reform by constitutional government, but that its liberty is threatened by Russia on the north and Great Britain on the south. The Russians have invaded the north under the pretext of keeping order, and the British threaten the same in the south. This is one of the cases in which a congress of the nations might do good.

The verses "Wanted: A Samaritan," by Prof. B. B. Warfield, of Princeton Theological Seminary, appeared in THE INDEPENDENT of January 31, 1907, but under the *nom de plume* of "Nicholas Worth, Jr." They are so striking that we are pleased now to credit them to their author, whose Kentucky free spirit they represent.

INSURANCE

Fire Insurance Rates

A RESOLUTION recently introduced in the New York Legislature requests an opinion of the Attorney-General on the following points: Under the anti-monopoly law, is the New York Fire Insurance Exchange, which fixes the rates of premiums for fire insurance in Manhattan, an illegal combination? Can the State constitutionally reduce premium rates? Has the Insurance Department of the State the facilities for determining the reasonableness, or otherwise, of fire insurance rates?

The first is a legal question purely, and therefore it may not be satisfactorily answered here. As to the second question, one would have some difficulty, under the present status of the laws, to figure out a way whereby the State could either lower or raise the price of any commodity or service furnished by individuals or private corporations. Assuming that the price of fire insurance protection is determined by the losses paid—and that is almost an exact fact—there can then be but one way in which rates may be reduced. That way consists in an organized effort to conserve destructible values; in other words, to reduce the fire waste. Long-established, well-managed companies do not make their substantial profits on high-rated risks. In proportion as the hazards in any given building diminish, the probability of destruction by fire decreases and the rate declines; and altho the margin of profit is reduced, it becomes more constant thru the reduction of the elements of chance and the enhanced longevity of the risk as a yielder of premium income. The public may be sure that the rates on any given class of risks, or on all risks in any given locality, fairly reflect the hazards existent in and peculiar to the class or locality under consideration. The State can constitutionally reduce fire insurance rates thru the enactment and rigid enforcement of laws that will effect a reduction in the fire waste. That is the problem legislators desirous of serving the interests of the people in this direction should propose to themselves. Rates are effects; the cause awaits extermination.

As to the third question propounded in the resolution: Of course, the Insurance Department of the State possesses no facilities that would enable it to pass upon the reasonableness of rates. Such facilities would be founded exclusively on experience deduced from actually conducting the business. This calls for a segregation of risks by classes and localities; then, to use a chemist's term, a "qualitative and quantitative" analysis of the various hazards entering into the risks; then a correct conclusion respecting the locality conditions, such as topography, climate, police regulation and administration, width and condition of streets, size and effectiveness of fire-fighting apparatus, water supply, and the like. Each of these factors makes for modification or intensification of the cost and demands consideration. Therefore it is reasonable to conclude that at the present time the Insurance Department is barren of the facilities inquired about.

FOLLOWING by four days the disastrous conflagration at Washington Square, New York, the State Capitol at Albany caught fire last week and was damaged to the extent of $5,000,000. As in the recent case of the State Capitol of Missouri, no insurance was carried. Reports strongly indicate that inadequate facilities were on hand to extinguish the fire. The blaze at first was small, but no water or chemicals were procurable, and even on the arrival of the fire department great difficulty was experienced in getting a stream of water into the building. The small fire had in the meantime gained great headway. The greatest loss is the damage to the library, which contained many early records that will be impossible to replace. It is estimated that it would cost $1,500,000 to replace the books obtainable in the open market, while the manuscripts and revolutionary records cannot be duplicated at any price.

THERE were 376 people killed in New York City last year by vehicular traffic. Of these 104 were killed by automobiles, 114 by trolley cars and 158 by horse-drawn vehicles.

FINANCIAL

The Bucket Shop Cases

It does not appear that the decision of the District of Columbia Supreme Court in the bucket shop cases will seriously affect the movement for a suppression of bucket shops. Of the twenty-nine men indicted, six had pleaded guilty and had been fined, but their associates attacked that part of the District criminal code on which the indictments were based. Their demurrer was sustained, the court declaring that the law was unconstitutional because it "penalized generally and indiscriminately the making of contracts." New indictments can be obtained, however, under the District's laws against gambling. The prosecutions undertaken by the Government in other cities do not, of course, depend upon any interpretation of the laws of the District of Columbia. In those cities the defendants are accused of violating the postal laws by using the mails for fraudulent purposes.

It would be unfortunate if the attempt of the Department of Justice to end bucket shop gambling should come to nothing. The Department has closed several hundred bucket shop gambling places, and it could say a few weeks ago that substantially all of them east of Denver had gone out of business. The first dispatches about this Washington decision indicated that the bucket shop defendants had won a great victory. They were misleading.

Oklahoma's Banks

When Oklahoma's law for guaranteeing bank deposits became effective, sixty or seventy banks there surrendered national charters and became State institutions subject to the new statute. Now they are coming back. More than seventy State banks have recently applied for national charters, owing to heavy assessments and, it is said, to a conviction that the law tends to favor speculative banking at the expense of banking that is careful and conservative. These withdrawing banks are in sound condition. This is shown by the examinations made at Washington. Oklahoma banks that cannot stand the test of these examinations will not apply for national charters. The tendency of the movement is, therefore, to increase the proportion of weak banks among those that remain subject to the guarantee law, and to make enforcement of the law more burdensome to those banks which are well managed and in good condition. The law can be saved from additional discredit only by legislative or executive action providing for searching and frequent examinations, and requiring improvement of methods in the institutions that are weak. The guarantee, unless it is accompanied by such examinations and the maintenance of a high average standard, tends to encourage banking that is loose and speculative.

Bank Deposit Guarantees

It has been decided by the Supreme Court that the bank guarantee laws of Oklahoma, Kansas and Nebraska are not at variance with the Federal Constitution. The court holds that a State has a constitutional right to make and enforce such laws; it does not, of course, say whether such action is wisely taken. The experience of Oklahoma gives weight to the arguments of those by whom the guarantee plan is opposed. By the disastrous failure of one bank, substantially the entire guarantee fund was used or tied up. A guarantee of deposits by statute and assessment tends to encourage loose and irresponsible banking, unless it is accompanied by searching and frequent examination, made by competent and honest officers who represent the State and the people.

....In ten years the output of cement in the United States has increased from 5,650,000 to 63,500,000 barrels.

....In 1909, as shown by the Census Bureau in a recent report, the consumption of sugar in this country was 79 pounds per capita, against 39 pounds in 1879.

....William H. Kniffin, Jr., cashier of the Home Savings Bank, Brooklyn, has been appointed secretary of the Savings Bank Section of the American Bankers' Association.

The Independent

VOL. LXX NEW YORK, THURSDAY, APRIL 13, 1911 No. 3254

Survey of the World

Lorimer Again

Senator La Follette reopened the Lorimer case April 6—the third day of the new Congress. His resolution sets forth that an investigation in progress in Illinois is disclosing important new testimony, and authorizes an investigation by a select committee of five Senators: Worts, of California; McLean, of Connecticut, and Townsend, of Michigan, Republicans, the first named being an insurgent, and all three being newly elected Senators, and Kern, of Indiana, and Pomerene, of Ohio, Democrats, also newly elected. A speech from Senator La Follette on this resolution was looked for Monday. The most important part of the "new testimony" is that which H. H. Kohlsaat, editor of the Chicago *Record-Herald,* has given. Mr. Kohlsaat has at length named Clarence S. Funk, general manager of the International Harvester Company, as his informant that a "slush fund" of $100,000 had been put up to elect Lorimer to the Senate. Mr. Funk, in his turn, testifies that Edward Hines, a Chicago lumberman, and active in Washington as a Lorimer lobbyist, asked him for a $10,000 contribution to the fund. Edward Tilden, a Chicago packer, is named as the treasurer of Lorimer's corruption fund. Mr. Lorimer declines to comment on the testimony. The reopening of this case by an insurgent Republican is evidence of the difficulty with which the attention of the special session is going to be focused upon reciprocity, the unique subject of President Taft's special message. The choice of the Republican caucus for Speaker of the House of Representatives was James R. Mann, of Illinois, who becomes minority leader in that chamber. In the Senate, Republican insurgents have entered their party caucus and will receive their proportionate share of patronage and committee appointments. The Democratic caucus has chosen as Senate leader Thomas S. Martin, of Virginia.

Interstate Commerce Decisions

Two vitally important decisions against the railroads were rendered April 3 by the United States Supreme Court. The decision in the case of the United States, appellant, against the Lehigh Valley Coal Company holds that the Circuit Court for the Eastern District of Pennsylvania erred in refusing to permit the Government to file an amended bill in the case against the Lehigh Valley Railroad. The amended bill will now doubtless be filed, alleging that the carriers' ownership of the Lehigh Valley Coal Company is a violation of the "commodities clause." It is believed, also, that the Department of Justice will undertake a thoro investigation of the relations of all the so-called "coal carrying" railroads, to find in what degree their illegality is only masked by the incorporation of dummy coal companies. The Court holds that the Interstate Commerce Law is contravened when the railroad exercises such "control over the coal company that it becomes a mere department of the railroad." The suit against the Lehigh Valley Railroad Company was instituted by the United States in June, 1908.——The opinion in the other case of significance for the railroads and express companies sustains the order of the Interstate Commerce Commission requiring carriers to give carload rates to shipments assembled in carload lots, and forwarded. The Delaware, Lackawanna &

Western Railroad sought and obtained an injunction in the United States District Court for the Southern District of New York enjoining the Commission from enforcing this order, which is now approved.——Judge Walter H. Sanborn, of the United States Circuit Court, sitting at St. Paul, handed down, April 8, an opinion in certain rate cases against the Minnesota State Railway Commission. The suits were brought by stockholders of the Northern Pacific and Great Northern Railway Companies, the Attorney-General, and the members of the Railroad and Warehouse Commission of Minnesota to enjoin the reduction of passenger rates in Minnesota from 3 to 2 cents per mile, and substantial reductions in the merchandise and commodity rates. All of the reductions except the commodity rate had been accepted by the railroads, so that evidence as to the results was not lacking. The decision is, in its terms, a sweeping one. The thirteenth and fourteenth clauses are as follows:

"Apportionment on the basis of revenue is the most reasonable and equitable method of assigning the value of railroad property in a State used for transportation to the various classes of its business in order to determine the reasonableness of fares and rates

"A net income of 7 per cent. per annum upon the value of railroad property in Minnesota devoted to the public use of transportation is not more than the fair return to which a railroad company is entitled under the Fourteenth Amendment to the Constitution."

It is expected that the State will appeal. ——The seventh annual report of the Bureau of Railway News and Statistics, published at Chicago, is the source of the following information:

"For the fiscal year transportation revenues amounted to $2,897,266,000, operating expenses to $1,847,189,000, taxes to $104,144,076 and income from operation $801,542,879. An analysis of the business, according to the report, shows that instead of the railways paying $405,131,650 in dividends as stated in Commissioner Lane's decision, only $166,828,874 could have been paid out of transportation revenues, the difference being paid out of the income from other sources, such as interest and dividends received from other railways.

"There were operated a total of 337,532 miles of track, of which 227,525 miles was main line road. This was an increase of 4,250 miles for 1910. June 30, 1910, there were 1,684,238 employees on all the roads, receiving for the year $1,137,016,508, or 42 per cent. of the gross earnings. The average daily pay increased during the past five years from $2.07 to $2.29. During the year the railways carried 1,760,103,000 tons of freight, an average of 146 miles per ton, far in excess of the figures for 1909."

Mine Disasters

Two mine disasters blotted last week's record in the United States. The bodies of seventy-four employees at the Pancoast mine of the Scranton Coal Company, at Throop, Pa., have been recovered, the miners having been entombed in the inner workings by a fire which broke out April 7, presumably in the engine room. The second disaster was the explosion at the Banner Mines of the Pratt Consolidation Coal Company, near Littleton, Ala., April 8. Over 100 men, all or almost all convicts, and chiefly negroes, were killed by the explosion or by the gas popularly named "black damp."

Chicago's Five-Term Mayor

A remarkable campaign produced a registration of voters such as has never been equalled in Chicago in a local contest, but when election day dawned stormy, April 4, too many of the registered voters who meant to vote for Charles E. Merriam, Republican, must have stayed at home, for his opponent, Carter H. Harrison, won by a plurality of 17,000. The successful candidate is the son of the Mayor of the same name, who was assassinated while in office. The present Harrison has himself served Chicago as Mayor four times. Charles E. Merriam, who was in many quarters expected to defeat Mr. Harrison, has been a resident of Chicago for less time than the other has served the city as chief executive. As Alderman, he has, none the less, been responsible for an investigation which uncovered graft "running up into the hundred thousands," and it was expected that if Mr. Merriam were elected he would make use of the information thus collected to lighten the efficiency of the municipal government. The defeated candidate was, until lately, professor of economics in the University of Chicago. Certain elements opposed him because he refused to declare for a "Sunday closing" law

governing saloons; but Mr. Harrison is equally latitudinarian.——The candidate of the Socialists for Mayor of Chicago received 22,294 votes. In Milwaukee, where the Socialist party has been in power for a year, a non-partisan candidate won over the Socialist candidate for Circuit Judge by a decisive majority. Socialism received a set-back also in the elections of Wichita, Kan. In Butte, Mont., however, the Socialist candidate for Mayor, formerly a Unitarian preacher, was elected by about one thousand pluraiity.

Mexico's Revolution

Little progress, if any, toward negotiations for peace in Mexico was made last week. Madero's father and one of his brothers were in El Paso for several days. Some expected that the revolutionist leader would meet them there. It is said that he declined to receive passports from the Diaz Government; also that he feared arrest by American authorities. On the 8th, his father and brother returned to San Antonio. They had failed to obtain from General Navarro passports for a journey to Madero's camp, which is a few miles from Chihuahua City. Two days earlier, Madero's representative in San Antonio had said that the movement for negotiations was a failure, as Madero had insisted upon the immediate resignation of Diaz, and Limantour had said that Diaz must remain in office. Madero's father had thought he could persuade his son to permit Diaz to hold office for a time, as Limantour, in the conferences at New York, had declared that if the old President should retire now, anarchy would follow. On the 7th, Madero issued an ultimatum, insisting upon the retirement of Diaz and a new election. He was willing to stand aside and to allow a Provisional President to be chosen from the Cabinet. It was reported that he would propose the appointment of a commission to carry out the reforms, one member to be chosen by Diaz, another to be selected by himself, and a third to be named by these two. The third, it was said, might be ex-President Roosevelt. It was admitted that Señor de la Barra, just before he left Washington, had a conference with Dr. Gomez, Madero's agent, but it was understood that they reached no agreement. Gomez urged that there should be open negotiations at Washington. This proposition was rejected.——At the Mexican capital it was decided that the proposed electoral reforms should be enforced first in the State of Guanajuato, in the election of a Governor. Señor Dehesa, Governor of Vera Cruz, resigned that office, and he will probably be made Secretary of the Interior. Vice-President Corral asked Congress for a leave of absence, and was permitted to leave the country for eight months. His unpopularity was shown in the debate upon his request.——President Taft explained to Mr. Sulzer, chairman of the House Committee on Foreign Relations, and other Democratic members, why he had sent the troops to the border. Mr. Sulzer said the Democrats did not intend to order an inquiry. Two days later a story was published to the effect that Japan asked Diaz for a coaling station; that he, knowing that Japanese had mapped all of his Western coast, hesitated for a time; that the United States, hearing of Japan's request, told him it must not be granted; and that then the troops were sent. But Mr. Sulzer said he was convinced by his conference with Mr. Taft and his examination of the papers in the case, that Japan was in no way concerned; that the movement was due wholly to reports about the condition of Mexico. Victor Berger, the Socialist member of the House, has introduced a resolution asking for a withdrawal of the troops and a submission to Congress of all papers in the case. The resolution speaks of the despotism and brutality of Mexico's governing class, and expresses sympathy with the insurgents.

The Race Question in Camp

It was announced on the 3d that Mr. Taft, owing to complaints about the conduct of the Ninth Cavalry, a negro regiment, in San Antonio, had decided to remove the regiment from the camp there and to distribute the companies at points on the boundary for patrol duty. In the absence of Congressman Slayden, of the San Antonio district, the complaints had been made by Congressman Garner, of the Brownsville district. The

latter soon discovered that two of the companies would be stationed in or near Brownsville. From that place, from Laredo and from other boundary points petitions were sent to Washington, asking that the negro soldiers be withheld from them. Then Congressman Slayden, who had been ill, told the President that prominent citizens of San Antonio urged that there should be no discrimination against the negroes, and also asked that they be kept in the San Antonio camp. Evidence was produced showing that nearly all of the stories about their misconduct in the street cars were false. They were denied by the manager of the car company. The chief of police also testified in favor of the negro troopers. It appears that in three weeks only one man, out of about 1,000, had been arrested. The President decided that they should stay in the San Antonio camp. There was also some gossip about Col. J. R. Marshall, a negro, commander of the Eighth Illinois militia regiment, who had been named by Governor Deneen as one of the officers to visit the camp. Such a visitor must be entertained by a regular officer of equal rank. Colonel Marshall was assigned to the quarters of the commander of a regiment a majority of whose officers are Southern whites, and with him was assigned a white colonel of militia from North Carolina. The press dispatches say that meals have been served to Colonel Marshall in a separate tent, while other official visitors of his grade have messed with the regular officers who are their hosts.

Madero's Men Still Fighting

Altho a majority of the revolutionists in the State of Chihuahua remained in camp during last week, about 60 miles from the capital of that State, there was fighting elsewhere, and outbreaks in the south were reported. Near Atlixto, in Puebla, ninety Government soldiers were drawn into a trap and a majority of them were killed. Revolutionists also raided the Tuxpan oil fields, in Vera Cruz. At the Pacific end of the northern boundary, the Socialists were unfortunate. Stanley Williams, a deserter from the United States army, who commanded a party of eighty-five, was attacked at Packard, a few miles from Mexicali, by a large Government force. He and more than half of his men were killed. They had been raiding the Cudahy and Otis ranches, which are owned by Americans. Near Culiacan, in Sinaloa, forty rebels were killed in an engagement. A menacing insurgent movement in the State of Jalisco was reported. Mines there have been closed and many of the miners have joined the revolutionist forces. George Crichfield, of New York, well known in connection with asphalt property in Venezuela and Mexico, was shot from ambush on his ranch at Tuxpan, where he had an asphalt lake and some oil wells. He died a few days later. Full reports of the affair at Aldama (Chihuahua) show that sixty-nine revolutionists were killed. Two sons of a rich ranchman had organized a force of 300 men. Having captured Aldama, they indulged in an orgy. In the night they were surprised while sleeping. They had no sentries. Among those killed were the two young commanders. Reports from Cucuani (Durango) say that every defender of that town was killed before the place was surrendered to the revolutionists. Surrender was followed by looting and the atrocities of savage warfare.

Central and South America

President Estrada, of Nicaragua, has ordered the election of a new Congress, the session to begin on May 1. He desires the promotion of a national policy broader than that which the Congress recently in session was inclined to support. Negotiation of the proposed loan of $15,000,000 in New York awaits the action of the Senate at Washington upon the pending convention concerning a loan to Honduras.——Bids for the construction of a large battleship and six destroyers for Chile were opened in Washington and London on the 5th. The bids of three American companies were lower than those of their English competitors.——Secretary Knox and Secretary Meyer, in answer to a House resolution of inquiry, say that our Government has assisted the American builders of two battleships for Argentina by giv-

ing them the use of plans prepared for our own battleships. It is argued that such aid should be given, in the interest of an extension of our trade relations in South America, and in order that our shipbuilders may be enabled to compete successfully with those of Europe, who are favored by their Governments in the same way. It is understood that the American bidders for the Chilean warships, if successful, will receive similar aid.——In a message to the Cuban Congress, President Gomez says that the public debt has been reduced by $3,465,000 in the last two years; that there has been unprecedented activity in the construction of railroads, highways and public buildings; that the sanitary conditions of the island are excellent, and that the new civil service law assures the selection of competent civil service employees.——In a pastoral letter the Bishop of Havana condemns the so-called harem skirt as unchristian and immoral, warning women that persistent use of it will cause excommunication.

English Affairs

The Veto bill, restricting the powers of the Lords, is in the committee stage of the House of Commons, and the battle over it promises to be long and hard. There are 957 amendments proposed, covering 74 printed pages, and each of these will be brought up for discussion, altho there is no hope of any of them passing. The adoption by the minority of dilatory tactics on such a large scale has aroused bitter feeling, and members of Parliament are already beginning to lose their tempers. In a debate on April 5 which Winston Churchill was conducting in the absence of Premier Asquith, who was indisposed, Lord Hugh Cecil accused the Premier of idleness and of failure to attend to his duties. This aroused a storm of protest, and the matter was not made any better by the subsequent remark of Sir Robert Findlay, that the House was not suffering so much from the absence of Mr. Asquith as it was from the presence of Mr. Churchill. During the division some of the members began throwing hats at each other, and the Unionists roughly hustled William Clough, a member from Yorkshire particularly obnoxious to them. When the members had returned to the House, Mr. Churchill complained to the Speaker of "the gross organized insult" to which Mr. Clough had been subjected, and the Speaker rebuked the Unionists.——Home Secretary Winston Churchill has brought a slander suit against a political speaker named Spencer, who brought up in the recent campaign the old charge that Mr. Churchill, when captured by the Boers during the war in South Africa, had broken his parole by his escape from imprisonment. Spencer apologized and the judge awarded nominal damages to Mr. Churchill.——The subject of national defense is being discussed in the House of Lords on a resolution introduced by Field-Marshal Lord Roberts, to the effect

"that in view of the altered strategic conditions of Europe this house views with grave and growing concern the inadequate military arrangement of the Government for the defence of the country and his Majesty's oversea dominions."

Lord Roberts commended the frank and manly speech of Chancellor von Bethmann-Hollweg in the German Reichstag, opposing the consideration of disarmament. He urged conscription and the maintenance of an army of a million trained men, saying that one disciplined soldier was worth six insufficiently drilled volunteers.

"There is no time to be lost if our army is to be made ready to fight It is my deliberate opinion that while other nations are daily and steadily becoming stronger and more powerful we are daily and steadily losing ground. Our margin of safety on the sea is rapidly disappearing and should war come upon us with the startling rapidity wherewith it has come to other nations in recent years we shall be found absolutely unprepared."

Viscount Haldane, Secretary of War, said in reply that the war intimated by Lord Roberts must be for the defense of either India against Russia, or of Canada against the United States, or of Egypt, and over the maintenance of the balance of power in Europe. He did not admit that the present volunteer system was so inefficient as Lord Roberts made it out, and he feared that the maintenance of an army of a million would bring the nation on the verge of bankruptcy. It was, he said, no time to talk of increas-

ing armaments when the people of all lands were beginning to show signs of a desire to be released from such tremendous burdens. Lord Curzon spoke in favor of the resolution, saying that he welcomed the idea of arbitration with America, but it was not from America that Great Britain ran the risk of invasion. At the conclusion of the debate the House of Lords adopted the resolution of Lord Roberts by a vote of 99 to 40.——The new treaty between Great Britain and Japan grants important concessions to British commercial interests, and this is not necessarily conditioned upon the maintenance of Great Britain's free trade policy. The duties on a large number of British imports have been reduced from 12 to 30 per cent., but are still higher than they were under the old Japanese tariff. Hitherto Japan has been opposed to the purchase or leasing of land by foreigners, but the new treaty provides that the subjects of each power are free to lease land in either country. The treaty is to be operative for twelve years from July 17 next, but the lease provision may be abrogated on due notice by either Power.——The Corporation of the City of Dublin rejected, by a vote of 42 to 9, a motion in favor of presenting an address to King George on the occasion of his visit to this city in July next. This is in accordance with the resolution of the Irish Nationalists not to have anything to do with the coronation ceremonies until home rule is granted. Captain James Craig, a Unionist member from Ireland, brought up in the House of Commons the question of rescinding the privileges of the city of Dublin on the ground of disloyalty.—— The efforts of the suffragets to invalidate the census by escaping enumeration were a failure. According to John Burns, President of the Local Government Board, the number who escaped counting were so few as to have no appreciable effect upon the accuracy of the statistics. One suffraget hid in the crypt of the House of Parliament during the night of the census, but was discovered in time to be duly enumerated with the rest of the population.——The Corporation of the City of London, by a vote of 22 to 9, has petitioned Parliament for the passage of the pending woman suffrage bill authorized by the Lord Mayor and other civic officers to present the petition at the bar of the House of Commons.——King George has revived the rule established by Queen Victoria that no divorced person is to be received at court.

The New Italian Cabinet

Premier Giolitti presented his political program to the Chamber of Deputies in Rome on April 8, and it was approved by a majority of 252. His policy includes many radical measures, but is not anti-clerical. Bills will be introduced by the Government for the extension of the suffrage to all men who have done military service, are over thirty and able to read and write; for pensions for old or disabled workingmen; for a state monopoly of life insurance; for proportionate taxation and other fiscal reforms; and for the payment of salaries to Deputies, so poor men could serve in the Chamber. The Socialists have agreed to support the Government in carrying out this program, but Signor Bissolati, the leader of that party, refused to accept the position of Minister of Agriculture that was offered to him by the new Premier, alleging as the reason that he had conscientious scruples against wearing a uniform and taking part in the functions of state required of the Ministers. Premier Giolitti has included in his Cabinet seven of the Ministers who served under his predecessor, Luigi Luzzatti. ——The new Minister of Marine, Admiral Cattolica, is planning for the construction of four improved Dreadnoughts, costing altogether $60,000,000. Each will have between 25,000 and 27,000 tons displacement and carry twelve 14-inch guns.——An anti-clerical fanatic named Pietro Desanti drew a revolver in St. Peter's, at Rome, and shot at a priest who had just finished mass. The policeman who arrested him was wounded in the arm by a second shot. Desanti is a native of Istria, forty-two years old. The uncle and aunt who had reared him determined to leave their money to the Church, and on learning of this he killed them both. For this crime he was condemned to death, but the sen-

tence was commuted to life imprisonment. At the end of twenty years he was released and went to the United States, where he saved to get money enough to go to Rome and kill the Pope. When he found that he could not get access to the Pope he shot at the first priest he saw.

The Trial of the Camorrists

Thirteen out of the thirty-nine prisoners on trial at Viterbo have now told their stories, and their eloquence has usually the effect of rousing prisoners and spectators to such a pitch of excitement as to force the adjournment of the court. Each in turn has protested his entire innocence of the murder of the Cuocolo couple, and denied any connection with the Camorra, and each wound up with curses on the informer, Abbatemaggio. Professor Rapi so injured his throat with crying that he had to be excused from attendance by the recommendation of his physician. Padre Ciro Vitozzi fainted during his testimony from his two days' fast, and a recess was taken by the court until his strength was revived by the forceful feeding with six raw eggs. Erricone, the leader, bursts into such hysterical weeping as to upset prisoners and spectators whenever he hears the name of his "martyred brother," "young, innocent and beautiful as a god," who died in the cell next to his in the Naples prison four years ago. In spite of the exhortations of the judge to be a man and bear up more bravely, he had to be excused from the room on account of his uncontrollable grief. Alfano or "Erricone" occupied the stand for two days, speaking with great dramatic power, at first in a low tone and quiet manner, then rising to a pitch of impassioned fury, as he denounced courts, carbineers and newspapers in such blasphemous and obscene language that he had to be seized and gagged. He described his escape to the United States, which he had no difficulty in entering, notwithstanding his criminal record. He had no passport and did not take the trouble to disguise himself. He remained in New York until he was recognized from a photograph by the detective, Petrosino, who was later assassinated at Palermo. He declared that he was "neither the head nor the tail of the Camorra," and that he had been guilty of nothing more than the ordinary excesses of Neapolitan youth. He admitted loaning money at extortionate rates to Italians intending to marry American heiresses, but defended the usury on the ground of the great risk. Ciro Vitozzi, the "Guardian Angel of the Camorra," told of his wrongs and sufferings in so pathetic a way that one of the prisoners fell down in a faint and a physician had to be sent into the big cage to restore him. Vitozzi declared that his only association with vice was in his capacity as a priest, and asserted that the Dowager Queen Margherita is indebted to him for eight masses which he said at the tomb of the late King Humbert. He denied the charges of witchcraft and licentiousness that had been brought against him. The jury has been supplied with files of five Neapolitan newspapers for 1906-1908 so they may read the published comments on the case, which are mostly adverse to the prosecution, and deny the existence of a Camorra. It is expected that the trial will last thruout the year and so far there is little prospect of a conviction. The prisoners, with the exception of Professor Rapi, who is a free-thinker, have petitioned the court to adjourn during Holy Week in order that they may prepare for Easter. The lawyers for the defense come to the prisoners' cage in the morning in order to take their orders for the lottery, which they base upon numbers suggested by the events of the trial.

French Labor Questions

A renewal of the difficulties which in recent years have interfered with the prosperity of French shipping is now threatened. On the night of April 2 the National Federation of Labor issued a proclamation ordering all workmen in the docks and ports of the Atlantic and Channel ports to stop work at once, and the unions or syndicates of the Mediterranean ports were requested to hold themselves in readiness to go out at any time.——The Municipal Council of

Paris has decided that it will not be advisable to hold an international exposition in Paris in 1920. The Chamber of Commerce, which also replied in the negative to the proposition, gave as its sole reason for the decision that it was impossible to undertake any great public works of the kind, which must be done at a given time, because of the unreliability of labor.——The pure food laws are causing riotous demonstrations in the wine-growing regions of France. The question at issue is the same that has caused so much discussion in this country, that is, when does a name cease to be geographical and become merely descriptive. The attempt was first made to limit the use of the word "champagne" to the product of the ancient province of Champagne, but this measure deprived large areas outside these limits of their accustomed label. The red flag was hoisted and a veritable revolution declared. The Committee on Agriculture in the Chamber of Deputies proposed as a compromise that the limit be extended and a territorial designation added in all cases, as, for example, a label reading "Champagne, made from grapes grown in Aube," but this is equally objectionable to all the parties concerned. On April 9 a great demonstration was held at Troyes attended by some 20,000 wine growers from all parts of the department of Aube. The railroads gave the vineyard workers free transportation, but many of them preferred to march thru the country on foot bearing banners inscribed "Victory or Death!" "Solution or Revolution!" etc. The "Iron Battalion" from Bar-sur-Aube was 300 strong and marched 35 miles. Their vineyard hoes had been beaten into pikes, and instead of the red flags, which had been prohibited by the authorities, the tricolor was borne, but either draped in crape or so wrapped around its standard that only the red showed.

Foreign Tribulations

It is officially announced that the bubonic plague has broken out in Eastern Java and there have been about 100 deaths among the natives.——Increased disorders are reported in Morocco, but it seems impossible to determine from the reports whether the Government or the rebels are getting the best of it. Several pretenders are in the field and the Sultan is said to be closely besieged in Fez. Both France and Spain are preparing for active intervention. A regiment of marines has been mobilized at Cadiz and will soon be dispatched to Morocco, followed by infantry, cavalry and artillery. Premier Canalejas made a statement of the Government's policy to the Cortes on April 8, and secured the consent of all parties to his foreign policy. He stated that the Government was determined simply to fulfil its obligations in co-operation with France, and he added "we are not going to subjugate but to civilize." Even the Republicans and Socialists exprest their approval of his plans so far as they had been explained, but reserved the right to oppose in the future any attempt to conquest.——In French Guinea an expedition led against the Sultan of Goumbra was ambushed by the natives and suffered some loss. The French then turned their machine guns upon the natives, killing about 300 of them.——The Turkish troops in Arabia are reported to have defeated the rebels in the vicinity of Sanaa on Yemen, killing more than 100 of them and demolishing the rebel forts.——Conflicts have occurred between the Albanian insurgents and the Turkish troops in the Vilayet of Scutari. According to reports there have been victories on both sides.——Various rumors of unsuccessful Royalist plots in Portugal have been reported during the past week. The most serious of these seems to have been a naval mutiny at Lisbon, about April 8. An attempt was made by discontented naval officers to seize the arsenal and to assassinate the Minister of Marine, but the insurgents were foiled and placed under arrest on the battleships in the harbor. Some of the infantry regiments have also been suspected of a disposition to mutiny.——On April 10 a revolt against the Government at Canton was reported by the way of Hong Kong. It was stated that the Tartar general commanding the troops had been murdered and that the city was in a state of siege.

The Song of Peace

BY JOHN GREENLEAF WHITTIER

[These lines are the concluding stanzas of a poem written by Whittier just after he had passed his nineteenth birthday. I find them in a scrap-book kept by his eldest sister. They were written before his first term in the Haverhill Academy, and have never appeared in any collection of his works.—S. T. PICKARD.]

"The battle ceased along the plain, for the bards had sung
the song of peace."—*Ossian.*

* * * * *

YE bards! whose visions swell
The glories of our age,
Say, have your mighty lays no spell
To calm the warrior's rage?

No! 'tis not thus you seek—
No meed for this you claim!
'Tis yours in glowing terms to speak
Of the warrior's deathless name.

Ye tell of the fame that falls
Around the mighty dead,
Who following Glory's trumpet calls
In the throng of strife have bled.

Heaven-hallowed Peace! to thee
A bard to fame unknown
Would dedicate his minstrelsy,
And thy sweet influence own.

And oh! had he the powers of song
Which loftier spirits feel,
The joys that to thy sway belong
His visions should reveal.

SECOND MONTH, 1827.

ANDOVER THEOLOGICAL SEMINARY.

Easter and Old Andover

BY SARAH STUART ROBBINS

[The author of this article died last August at the age of ninety-three. She was the daughter of the famous Prof. Moses Stuart, the aunt of Elizabeth Stuart Phelps Ward, and herself an author. Her last book was a delightful account of the life at Andover in the thirties and forties in the scholastic generation before the days of Professors Park, Phelps and Shedd, who are remembered by the present elder generation of graduates. This article was written not long before Mrs. Robbins's death.—EDITOR.]

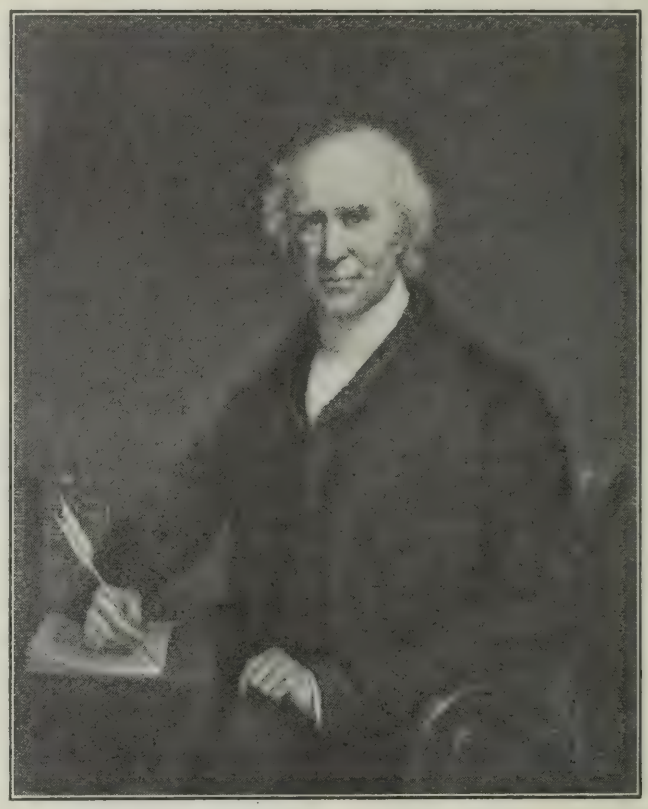
EASTER Sunday never dawned upon the Andover of olden time. Tantalizing hints about Christmas, a dim suspicion that Lent was somewhere observed as a fast of forty days, a legend of Good Friday—these came to us but vaguely, almost as myths; and as for Easter, I doubt whether during our childhood days we even knew its name.

For this state of things it would be difficult to give a reason. To say that out of a strictly Puritanic spirit Andover held church holidays in righteous abhorrence, wishing, like Luther, "that there were no other festival days among Christians but only the Lord's Day," would not give a correct idea of the true liberality which really existed there. As to Christmas, of course, no member of the first faculty believed that there was any historic ground for naming as Christ's birthday the 25th day of December; and therefore they would never have recognized, much less have justified, its observance. We children had outgrown Santa Claus and Christmas stockings before we came to know their worth. To Lent we should not have taken kindly; for, indeed, our whole lives lay within the boundaries of a mournful Lenten season. Good Friday came to us, in essence if not in name, with every lecture preparatory to the communion. But Easter Sunday, the solemnly joyful holiday, how that, with its mighty formative influences, could have been left out of our lives, is to me a matter of surprise.

If there was ever a community upon which rested the benediction of the resurrection, it lay upon that of Andover Hill. "Because I live, ye shall live also"—why, this was the watchword of daily life. Each day, from every dwelling house and from every room of the long seminary buildings as they rose story above story, there went up joyful thanksgivings for the rolling away of the stone from the sepulcher on a morning which had hallowed the early dawn of all other days. It was almost as if angels waited there, always in shining garments, to ask of the timid, with their faces bowed

down to the earth, "Why seek ye the living among the dead?" and who can tell how many went away from those orisons to their daily work with this answer ringing in their souls: "He is not here: for He is risen, as He said"? As in the monasteries of Catholic countries prayers are offered and vows are made before images of the crucified Savior, so here, if I may be forgiven the comparison, in this secluded, monastic life, a living conception of the risen Lord, "who had suffered these things and entered into His glory," was always with them, "expounding unto them in all the Scriptures the things concerning Himself." It can hardly be supposed, moreover, that in all Andover there was a single person who had not stood before an open grave, into the coldness and darkness of which he had seen with streaming eyes and breaking heart. There cannot have been a soul there that had not laid away one beloved, and, in the awful stillness and silence, only intensified by the unanswered call which the bereft soul is always uttering, had not heard those only words of comfort that are truly comfort: "Because I live, your dead is not dead, but sleepeth, and shall live also." Life without that first Easter morning would, in Andover, as everywhere else on this broad earth, have been death indeed.

And yet, with all the true devotion following—consequent upon—the resurrection of our Lord, imagine, if you can, the little Andover chapel dressed for Easter Sunday, or any other expression of this feeling, except the legitimate outbreathing of prayer. Fancy the pulpit with vases of choice exotics upon its faded cushions, with wreaths of smilax festooning its small, plain sides. Imagine callas opening their white cups and flaunting their shining leaves in the very face of the reverent preacher. "What! Easter in Andover!" the Puritans of that hill might have exclaimed in their first horrified surprise. A Congregational church with flowers and crosses and crowns! with anthems and carols, and the devil's own wind and stringed instruments! to lead the faithful, thru the door of praise, to the mercy seat! Oh, the degeneracy of these modern times! Oh, these idolatrous ways!



That this prejudice, however, would have been strong enough to interrupt their lifelong habit of attendance at church, I can hardly believe. It almost seems as if I could see Dr. Porter walking slowly up the broad aisle, his dim eye lighting with esthetic pleasure as he catches a glimpse of the beautiful flowers; Dr. Woods gazing in mild surprise at the unwonted visitors; Professor Stuart drawing his silk handkerchief across his mouth and nodding, with an odd mixture of smile and frown, from the flowers to the row of ecstatic children he has just ushered into the long pew; and Dr. Murdoch, with a non-committal face. Leaping a few years, I fancy how, to Professor Edwards, whose keen and quick perception hidden links joined the seen with the unseen, the delicate perfume of the chosen flowers would have breathed of the spices and the ointments which the weeping women brought on that auspicious morn to the empty sepulcher. I doubt whether a vase would have been sent away, or even the smallest bud have failed of its mission. Perhaps one and all might have fled from

REV. MOSES STUART, D.D.,
Professor of Old Testament Literature in Andover Seminary, 1810-1852.

the music that now hallows the day, had it been chanted from the little gallery above the chapel door. But well we know there will not be a deaf or averted ear when thru the listening heaven there reverberates the glad new song: "For Thou wast slain and hast redeemed us to God by Thy blood." One can hardly fail, recalling the audience of that time, to wonder if they keep Easter now, in the new temple not made with hands; if in their white robes and with their palms in their hands, they bring not also rare deathless flowers, gifts to the "First begotten of the dead."

As it used to be in Andover, so it was, to a greater or less extent thruout Massachusetts. It would be extremely interesting, if it were possible, to trace the cause of the change in sentiment since those old days. How has it come about that what was idolatry and the worship of "the mother of abominations" a century ago, is the true worship of the true God now? We know who is the same yesterday, today and forever, and are sure that the change is in us; but wherefore has it come?

REV. LEONARD WOODS, D.D.,
Professor of Sacred Theology in Andover Seminary, 1808-1846.

Are we less spiritual now? Must the horns of the altar be flower covered before we can lay hold of them? That is a question easy to ask, too difficult to answer. On Easter night trains of cars bear crowds of people from the suburbs into Boston to attend oratorios and sacred concerts. Suppose Cotton Mather, or Thomas Hooker, or John Davenport, had lived within an easy three minutes' walk of the station, would they have gone? Would Dr. Porter or Dr. Woods have hurried down the long hill, watch in hand, to catch the flying city-bound train? I doubt it very much. With the Puritan blood running so blue in their veins, they could hardly have added to all the other innovations a ride in the cars on the Sabbath day without feeling that ghosts were sitting by their side. Yet who shall doubt that last Easter day men as good, as true, as intelligent, as Christian, as any of these, were present at such concerts? "I know that my Redeemer liveth," sung by great artists, pealed out from melodious organs, caught up and echoed over and over by trained orchestras, gains in majestic power, touches more tenderly the hearts waiting to rejoice in it, steals more gently and soothingly into weary and heavy-laden souls, giving them rest.

Sometimes I grow almost impatient in my desire to bring back those buried years ago into our wonderful world of today. What would they say, what would they do? Would Cotton Mather miss his witches, his Quakers, his Anabaptists, his "troublesome and meddlesome men"? And what would he think, to see the old churches, if any still exist, wherein he laid down the strict rules of the law, with their Easter lilies, their wealth of flowers and perfume? Does his grim old ghost still haunt the accustomed scenes? Did it perambulate Boston streets last Easter, with a big Bible and a big sermon under the arm? And if so, did it shake its gaunt sides in sullen displeasure at the untoward changes, or did it smile a ghostly smile of sympathy and joy? Let us hope that he would not frown, or pour out upon the chalices of the tender flowers his

Latin anathemas; for is it not God that has made the lilies of the field, toiling not, arguing not, only praising—Easter anthems, every one? Surely we may trust that in the wonderful resurrection, in that twinkling of an eye, many things besides our poor bodies are changed, raised incorruptible? In his own Easter morning, his long Easter Sunday, has there not come to the Puritan divine the full blaze of the light in the pale dawn of which we of the earth rejoice? And does he not comprehend, as we may not, the mystical offerings we bring?

Of all the Sundays of the year, this one is fraught to us now with deepest meanings, with greatest possibilities. We could not drop it out of our lives and find them all the same. And yet its sun rose and its sun set, in olden time, unnoticed, unwelcomed. It dropped behind the long western Andover horizon, and its setting was marked only by the silent evening star.

Continued Life—An Easter Message

BY CHARLES E. JEFFERSON, D.D., LL.D.

Pastor of the Broadway Tabernacle, New York City.

"IF a man die shall he live again?" It is an old question kept perennially fresh by the tolling of the funeral bells. The question has a fascination for some of us which it did not possess a year ago, because since last Easter we have stood beside an open grave. Death ever whets our interest in all the problems of life. The grave forces us into moods of reflection, and the heart asks questions which the intellect must do its best to meet.

Of course, no answer can be given to this question which carries in its hand a demonstration. But it does not follow from this that no satisfying answer can be rendered. There are many facts which are beyond the reach of demonstration. Our apparatus for proving things is primitive and clumsy, and many truths may wisely be accepted which are incapable of proof. We do not pass into the realm of dreams and shadows when we leave behind us those instruments with which in certain fields we verify the things we want to know.

That life after death is possible, no one will dispute. To say that death means extinction is to say something which no man in this world can ever prove. Many keen eyes have been for centuries on watch, but no eye has ever seen a human spirit pass into nothingness. Science has found out many things in heaven and on earth, but she has not yet discovered what happens to a man after death. Upon this point she is as ignorant now as she was at the beginning. The grave emits no vibrations which either the eye or the ear can catch. The most stubborn skeptic is, therefore, forced to confess that, for all he knows, life after death is possible.

But is it probable? At this point philosophers begin to talk. For ages they have been pondering this problem, and have accumulated a mass of observations and deductions which to many minds bring assurance that death is not the end. They have much to say about the universality of the belief in immortality, about the instincts which survive thru the generations and the desires which cannot be extinguished. In the structure of man's being there have been found indications that he has been created for a life beyond the grave. The vast compass of his reach, the hights to which his aspirations soar, the realms of knowledge and of virtue of which he dreams and of which he cannot take possession within his life this side the grave, all this is counted evidence that when a man dies he lives again. We are told that man's endowments are larger than the needs of this world demand, that he has capacities for which there is on earth no opportunity for exercise, and that the nature and variety of his endowments are evidence that he is a creature intended to live in two worlds. And then our attention is turned to the moral tangle which history presents, with its unredressed wrongs, its unretrieved losses,

its tragedies of agony and death in which justice was defeated and virtue failed to win a crown. Another world is needed —so men tell us—to make endurable the world in which we are living now. To prove the weight and worth of all this evidence, a great company of men and women of distinction is made to pass before us, all of them testifying to their unwavering conviction that the soul of man never dies.

But after philosophy has put in all her evidence, it is still possible to doubt. The arguments are plausible, but they are not conclusive. The heart may say, "I have listened to all you have to say, and yet I know that instincts may be delusive and intuitions may be vain. Hopes sometimes deceive us, and promises are not in every case fulfilled. Convictions haunt us which later on melt into thin air, and who knows but that all these evidences of immortality may be an elaborate deception, and man's hope of a life to come a pleasing but empty dream? Then what?

At this crisis a man must fall back on his conception of the Power from which all things proceed. What he thinks of the Supreme Being will in the end determine his belief in regard to the future of the soul. It is not so much what the mind thinks or the heart wishes, as it is what the Eternal Power is seen to be doing in his universe, which furnishes the solid ground on which enduring convictions concerning the soul's destiny can be built. To pass from an instinctive hope into a reasoned faith in immortality a man must deepen and enlarge his knowledge of God. To know Him is life eternal.

It is for this reason that Science is a valuable witness in these high matters, for she is familiar with many of the principles and methods of the Eternal. She keeps her eyes upon the Cosmos. Her business is with phenomena, the stream of facts and events which flows thru space and time. She takes note of the august and orderly procedure. Certain principles come slowly into view. One law after another is gradually disclosed. The invisible things of the Creative Energy are clearly seen, being perceived thru the things that are made. We know God by what he does. And the scientific observations of His movements have given the soul new grounds of hope.

It is now clear that we are living in an ordered world. Order is heaven's first law. There is no place in the universe for accident or chance. We live under the reign of law. The law is universal and unchangeable. This is the first doctrine of the creed of modern science. Death then is no accident, but is a fixed feature of the world order. It is appointed to men to die. Death is a calculated incident in a process. It has a function assigned it by the World Ruler. It is a part of life. It may be a preparation for something.

Again, it has been clear that the Almighty does not like annihilation. He refuses to allow even an atom of matter or an ounce of energy to be dissipated and lost. The conservation of energy is the second dogma in the creed of Modern Science. Now energy is of different forms, and the highest form with which we are acquainted is personality. If many forms of energy are indestructible, possibly personality is indestructible also. If atoms have a power of resistance against which the gates of destruction cannot prevail, it is not impossible that that form of energy known as the Human Will also possesses unconquerable powers of self-preservation.

It is clear from what our eyes see that the God of Nature is a frugal God. He gathers up the fragments that nothing be lost. He turns everything to account. He squanders nothing. Our own bodies after death are dissolved and built up into other structures which become the instruments of his purpose. What will a God who, so far as we know, casts nothing as rubbish to the void, do with human personality when its career on earth is ended? It is the most precious product which the earth produces. It is a form of spiritual wealth amassed by years of sacrifice and effort. It is a bundle of energies and powers apparently capable of being used for high and holy ends. It is not like the God revealed in Nature to squander this form of riches, converting it into nothingness in the subtle flame of death. That would be like dashing a costly lamp to pieces just after it had been lighted.

The God whom Science knows is a patient God. His processes are ex-

tended—to our mind interminable. He does nothing in a hurry. He uses up centuries in the consummation of his plans. The leisureliness of the Almighty is one of his most amazing attributes. It passes clear beyond our comprehension. We never so realized the infinite patience of God till men began to tell us about the process of evolution. We found ourselves at once in a world of vast horizons, and in the presence of a God whose favorite principle is progress by growth. Having seen how far man has climbed, it is easier to believe that he will climb higher. The God of Science is not a God who having brought a creature so far, is likely to grow suddenly weary of it and convert it in an instant into a handful of dust.

The God of Modern Science does nothing which is not worthy man's closest attention. Every fact is sacred and must be scrutinized and weighed. We must sit down like children before it and listen to what it says. Docility is the cardinal virtue of Science. Now the most wonderful fact in the universe, so far as we know it, is the mind of Jesus. His mind is a product of the cosmos. His life is a manifestation of forces which are resident in Nature. His consciousness is a phenomenon to be studied with closer attention than either the starry heavens or plant or animal life, for more of the nature and intent of the Eternal Spirit can express itself in a man than in a rock or a star. A man is destitute of the scientific spirit who works out a theory of life or of the world without reference to the mind of Jesus. The scientist who does it is like a botanist who refuses to look at the most wonderful of all the flowers, or a geologist who takes no account of the highest and most majestic of the mountains, or an astronomer who refuses to turn his telescope on the brightest of the stars. As rational beings we are bound to fix our eyes on this Man of Galilee. His name is above every name because his character was the finest ever exhibited among the sons of men.

As soon as we approach him we discover that his supreme interest is in God. In all his thinking and action he begins and ends with God. His estimate of man is based on his view of God. God is Father, and therefore all men are brothers, and therefore mutual service is the central law of human life. The world which now is lies to Jesus's mind in the light which falls on it from God, and so does the world which is to come. To Jesus man is immortal because he is the child of God. Men all around him were denying life after death, and Jesus told them that their unbelief was due to their ignorance of the power of God. Their skepticism had its roots in their failure to grasp the true nature of the Eternal. It was because of his own clearness of vision of the character of God that he spoke of man's future in accents that carried in them the music of unquestioning assurance. His confidence never wavered. The problematic had no place in his thinking. The greatest of the Greeks had endeavored to prove immortality. Jesus is content to assert it. He asserts it with the quiet confidence with which one states an axiom in mathematics or a formula in physics. "In my Father's house are many mansions. I go to prepare a place for you." That is all, and that is enough. On the cross he said: "Father, into thy hands I commit my spirit." In his last utterance he linked together his belief in the life everlasting and his conception of God.

The secret then of an unwavering faith in the immortality of man, lies in the Christian conception of God. That conception has not been weakened or altered by anything which Modern Science has discovered. On the contrary, it has been brightened and confirmed by the enunciation of great principles which Science calls natural laws. The boldest teacher of Immortality among the apostles was Paul, and it is significant that his favorite name for God is "the Father of our Lord Jesus Christ." We think of God most truly when we think of him as Jesus thought of him. When the God of Jesus is our God too, the heart receives its answer to the question, "If a man die shall he live again?"

But suppose that a man cannot fall back on the view of God given to the world by Jesus. What then? Let him begin at once to live like an immortal. Let him plan his life as tho he expected

to live forever. No matter what his view of God, let him live like a son of God. In other words, let him live like a man. It is when a man lives up to the possibilities of his highest self, that he becomes bold to claim the things that belong to him. It is Christ in us—said a wise man—who is the hope of glory, which being interpreted means, I presume, that the guarantee of immortality lies within us, and that it is when we are obedient to the high and inexorable laws of our being, our filial nature being lifted to its highest power, that we become aware that life is endless.

Peers and Commoners at Westminster

BY JUSTIN McCARTHY

AT the time when I am beginning the present article for The Independent, the great, and I hope the final struggle between the hereditary and the representative legislators of the British Islands has not nearly come to its end. But the general impression produced upon the public mind thus far appears to be that the Lords do not contemplate anything like the utterly desperate resistance which it seemed to be at one time confidently expected by the devoted worshipers and the irreconcilable enemies of the hereditary principle would at least commemorate its disappearance by a blaze.

So far as the debate has gone only three or four figures appear to have made a very distinct impression on the House of Commons and the general public, and even these are figures which we must have all felt quite sure in advance must produce such an impression. Let us take, in the first instance, the figure of Mr. Balfour. I have for myself been always fully convinced that Mr. Balfour only forfeited his chance of becoming a great imperial statesman by his continued adhesion to the principles of the Conservative party. Nature intended him to be a great statesman, a great leader of a great party, but the events of his life pledged him to the membership of a political party which had nothing great or even real about its principles and was pledged against the movements of the hand of time. Thus while one could not help, even one with political opinions like my own, admitting and admiring the marvelous ingenuity of the manner in which he submitted his own case to the House of Commons, few of us could help wondering how he was able to impress himself with the conviction that such a pleading could produce any real impression on an assembly of practised and practicing public men.

Lord Hugh Cecil also proved himself an effective speaker in the course of the debate, and he had the courage to make his chief object of attack Mr. Winston Churchill, who for some time had done his best to subdue himself to the doctrines and the discipline of the Tory party, but at last found it, as most observers expected that he would, impossible to subdue his mind to the principles and the discipline of Toryism, and had therefore followed his intellect whither that led him. The fact, however, seems to me quite beyond dispute that the debate in the House of Commons has not been sustained by any means so vigorously by the Tory disputants as might have been reasonably expected. Even those of us who had come to regard or had always regarded the whole theory of the hereditary principle in legislation as only worthy of a place in the constitutional arrangements of some community described in "Gulliver's Travels" were disposed to assume that the champions of the House of Lords in the representative chamber of Parliament would make a much more ingenious and at the same time more impassioned defense of their hereditary institution. There came back into my mind by some curious freak of memory the recollection of a scene in Dickens's "Pickwick Papers." Mr. Pickwick and his life-comrades are making an excursion thru an English county in an open coach and a storm of rain suddenly comes on which threatens to

drench them in their expedition. Samuel Weller, Mr. Pickwick's immortal servingman, is seated beside the driver, with whom he is talking unconcernedly. Mr. Pickwick notices this fact, and in his usual kindly and genial fashion says to his servant, "Sam, you don't seem to be minding the rain." Sam replies, with his characteristic cheerfulness, "I don't see any good minding of it would do, sir." It might perhaps have been assumed that the House of Lords were acting on Sam Weller's philosophic principle, but I must say that if we were to idealize the Toryism of the House of Lords in one symbolic figure, it would hardly be that of the brisk and humorous Samuel Weller.

It is quite possible that the vehemence of the controversy on both sides may have been kept much under control because of the fact that the coronation of the present King is to be for the British public the great event of this year. King George V is to be crowned on the 22d of June, and the earlier part of the year does not perhaps seem to the majority, either of Lords or Commons, quite an appropriate or seemly season for a series of animated controversies between one legislative chamber and the other. The coronation ceremonies will have of necessity to be conducted as if they represented the loyal devotion of a thoroly united people, and it must seem somewhat difficult for the representatives of that people to maintain such an impression while its parliamentary chambers are waging at the same time a constitutional war which threatens the absolute abolition of that chamber which is named next after the sovereign in the roll of the imperial institutions. In the meanwhile, however, there can be no doubt that the coronation ceremonies and the preparations for them will engross as they come nearer and nearer a great deal of that public interest which is now still supposed to be exclusively claimed by the struggle between Lords and Commons.

King George V, as our present sovereign is named, has assuredly begun his reign in a manner which seems to speak with high promise as to its future popularity, and it does not need much study of English history to be aware of the fact that his predecessors who bore the same name had not done anything to bequeath such an endowment to him. The present sovereign is therefore opening up an entirely new biography in the association of that name with the history of British monarchs, and we know, too, that his immediate predecessor, the late King Edward VII, had won for himself the well-merited honor and affection of his subjects all over the globe. We may naturally assume, therefore, that the ceremonials of this year's coronation will have much effect in withdrawing national attention from the troubles of the peers.

Not for a long time has any book appeared from a London publishing office which created so much public sensation

KING GEORGE V.

as "Sir William Butler: An Autobiography," by Lieut-General the Rt. Hon. Sir W. F. Butler, G. C. B. General Butler passed out of life before the book's actual completion, and it was published under the care of his daughter by Messrs. Constable & Co., London. My American readers will, I think, well re-

member the leading passages in the military career of the great soldier which have won for him an abiding fame. But there was much in that career as well as its military achievements which has given his autobiography an especial and a peculiar claim on the interest of the reading world now around us and yet to come. General Butler was born and brought up in my native country, Ireland, and he tells us in this volume that his earliest recollections were associated with the ever memorable Irish famine, and he has some recollections of a still earlier date which included the being taken to see Daniel O'Connell when that great Irishman was a prisoner in Richmond Prison, Dublin, and being lifted in the arms of the illustrious and almost gigantic patriot. In 1858 Butler became an ensign in a British regiment, and then began his brilliant career as a soldier which never weakened in any sense his strong national sentiments. American readers will, I am sure, have followed his brilliant career thru his many wars and down to the part he took in the great South African struggle, which brought him into so much antagonism with all the noisy Jingoes who have played of later years so unattractive a part in English political life. General Butler never lost his affection for the country of his birth, while he proved himself sincerely devoted to the true interests, the really best interests, of the British dominions. I came upon a very remarkable passage in which General Butler gives his estimate of Charles Stewart Parnell, which I quote here in order that my countrymen in the United States may know how thoroly, up to the very end of his noble life, the spirit of Irish national feeling still lived in the breast of this great Irishman, who had rendered such service to the British Empire on so many foreign fields, but who never renounced or concealed his devotion to the cause of his country.

SIR WILLIAM BUTLER.

"Parnell was at this time at the summit of his power. His mountain home at Aughhavanagh lay some twenty miles from us at Delgany. When the grouse shooting began in August I got a letter from the Irish leader in London asking me to join him at Aughhavanagh. I accepted with delight. I looked upon Parnell as one of the most remarkable men then living in the Empire. Today, twenty-two years later, I regard him as the greatest leader of his time."

Now we have an English Government in full power and pledged to the carrying out of that Home Rule policy which Gladstone, inspired and impelled by Parnell, was the first British statesman to adopt, and which he would assuredly have carried to success but for the interposition of the House of Lords—that legislative chamber which is now awaiting its sentence of extinction.

I feel sure that American readers in general, and not merely my countrymen resident in the United States, will give a welcoming reception to the news of the remarkable success quite lately accomplished in the dramatic world by the play of which Miss Johanna Redmond, daughter of John Redmond, the distinguished and powerful leader of the Irish National party in the House of Commons, is the authoress. *The Daily News* of March 7 tells us this play, "Falsely True" is a little Irish play fairly typical

of those which are in favor at the Abbey Theater, Dublin. The play is described as an "incident after the Robert Emmet rising in 1803." The atmosphere is highly charged from beginning to end." The remainder of the criticism tells us more about the performers than about the authoress, and I may freely confess that the success of the authoress interests me more than the success of the actors and actresses just at present. The Redmond family have always shown themselves versatile. John E. Redmond, the present leader of the party, was the son of an Irish father who had previously made for himself a conspicuous position in the House of Commons, and William Redmond, that father's younger son, had served in the British navy and I see is now the hero of a popular Irish song describing him as "Billy the Bold Militia Boy." I am very glad indeed to hear that Johanna Redmond has won for herself a success in a quite new field, a field, however, in which woman's intellectual force has at various intervals of at least the modern world succeeded in achieving for itself some distinction.

LONDON, ENGLAND.

The Regeneration of the Small College

BY HARRY A. CUSHING, Ph.D.

[At its twenty-fifth reunion last summer the class of 1885 of Amherst College authorized three of its members, Ezra Parmelee Prentice, Esq., of New York; Ellsworth G. Lancaster, Ph.D., LL.D., president of Olivet College, and William G. Thayer, D.D., headmaster of St. Marks School, to present to the trustees certain somewhat radical recommendations for the future policy of Amherst College. Their printed address has attracted no little attention in academic circles, because of the bearing of its suggestions on what are called the smaller colleges as against the larger universities. The present article will make the issue clear to the reader. The author is also a graduate of Amherst, in the class of 1891, a well known lawyer, and is Professor and Acting Dean in the School of Law of Columbia University.—EDITOR.]

THE old, unsettled problem of the status and service of the small college has never received such keen discussion as has followed the recent address of the Class of '85 to the trustees of Amherst College. The solution of that problem thus far either has been made unnecessary or has been avoided. In some instances, the small college has ceased to be small; in other instances it has ceased to be a college; in still other instances it has temporized in the hope of outgrowing one characteristic or the other under the stimulus of purely business management or of academic competition. This indecision has been met squarely by the proposals of this address; and if these can be adapted to past traditions and existing conditions, either at Amherst or elsewhere, there may be one small college unique in its definite and ambitious purpose, which will stand for a higher ideal in collegiate scholarship, which will not represent the prevailing spirit of inert opportunism and philosophic compromise, and in which the faculty will do more than "organize the interruptions" of college life.

The address, in which the class has "stepped boldly into a relation to their college which opens up an entirely new field for alumni activity," has already aroused abundant comment and has been regarded as a summons to some small college to realize and seize upon what many believe to be a real opportunity for public service. Unconsciously it applies the test of the unsatisfied world to the satisfied college.

The underlying idea is that the small college should provide a broad cultural training adapted to meet the present call for carefully trained graduates, should lead in a rational reaction against the prevailing trend to vocationalism and "business" education, and should illustrate the utility of a reversion to the old humanities, using them, with their modern developments, as the basis for four

years of discipline. The college course would become a real business for all, and not a diversion for many. Having once adopted an ideal and a standard of training, those would be maintained and to their maintenance all else would be subordinated. As no responsible newspaper, even tho a purely commercial enterprise, should allow its editorial page to be influenced by its business department, so no college should permit its standards to be lowered or its methods to be relaxed in order to preserve the numerical strength of its student body.

To these ends, as attainable in this instance, only five specific suggestions are made: the strengthening of a modified classical course; the abolition of the B. S. degree; the indefinite increase of the salaries of professors; the limitation of the number of students; and the admission of students only thru a competitive examination or some other really selective process.

The proposal of anything bordering on classicism is certain in these days to meet much hostile criticism; and the use of the term classical will in some quarters be reason for prejudice against any plan. No word seems more available as a description of the course in the small New England college of fifty years ago. It was classical, in that Greek and Latin were predominant; but it was much more. Then the small college was stimulated by a spirit of puritanic idealism and devotion; singleness of purpose was strengthened by the possession of an unusual opportunity; vigor and thoroness in all work were maintained by the realization that college then meant privilege; and thru all ran the conviction that the college man owed some especial duty to the public. That was the controlling spirit of the classical college; and a return to that is to be desired quite as much as a return to Latin and Greek. Indeed, the proposal of a modified classical course takes it start from the proposition that a college should train for public usefulness men who will have breadth and thoroness, the power of application as well as of appreciation, and the persistence which usually is developed only in the work of the world. If the spirit of the small college could be the spirit of the old classical days modified by the better portion only of the modern college spirit, there would be little demand for any change of curriculum. For such a revival of the old spirit and old ideals no more favorable place and no more congenial atmosphere can be found than in the small college of New England.

So far as the curriculum is concerned, these most recent proposals are not radical. While the cultural and even inspirational value of the classics is insisted upon, recognition is also given to the importance of the modern languages. The sciences, too, are specifically valued as important factors in a well-rounded course. In fact, so far as subject matter goes, the modified classical course is substantially the present course in many colleges, but for the fact that in recent years some colleges have appeared to treat the classics as dying languages, of none but sentimental value. Against that tendency to decry the utility of the classics now appears this vigorous revolt. If there is to be anything of idealism in college life it can only be by properly subordinating those tendencies which aim at developing chiefly an earning power. The attempt is to bring about a reversion to old ideals, and some college, equipped with a faculty suitable for such work, may take the leadership in reforming American college life and in freeing college education from the criticism of the business man who sees in it neither sound business training nor broad scholarship and only disqualification for success in business.

The second proposal, the abolition of the B. S. degree by a college of the modified classical type, calls for no comment or argument. If the small college does not, as few do, train for a scientific calling, the courses underlying the degree can be little more than cultural courses, and the degree will be a misnomer. If such a degree really differs from the B. A. degree only by ignorance of Greek (and sometimes Latin also) and, possibly, by slightly greater knowledge of the sciences, then it really means nothing distinctive. This would still more clearly appear to be the case wherever a candidate for the B. A. degree is permitted to take even more courses in science than are required of the candidate for the B. S. degree. The proposition is unan-

swerable that a degree should not in itself be a deceptive figure of speech.

The third proposal, that the college should declare for a policy of indefinite increase in the salaries of professors, will commend itself to many. This has been a prevailing and futile dogma since colleges began. The first professors looked upon their calling as akin to that of missionaries, and this error has burdened all their successors. The early types were not urged to go into teaching; they felt called to the work; and exercising a choice of a well-filled calling they did not complain of its scant recompense for devoted service. No amount of comment has been able to alter this situation. The press today, and for years, has been full of generalities on the subject; but seldom are figures offered. When it appears that in a well-endowed college the average man of the entire faculty pays out yearly for the necessaries of living a few hundred dollars more than his salary, certainly in that college the professors have to "magnify their calling" at their own expense and sacrifice. To demonstrate this injustice a combined balance-sheet of the faculty is conclusive. To provide an adequate remedy, and to establish quality as the final test of usefulness, a college must be content to have the bulk of its funds so obscurely invested as to show a return only in the classroom. This requires the rare power to resist the temptation to build and expand. The committee who prepared the address in question would seem to go further, and have their college decline all gifts of buildings which might be unaccompanied by provision to meet the increased maintenance charges or which might provide facilities for more than a fixt maximum of students. To adopt this policy involves an excess of modesty in finance to which few college presidents will be able to yield. They might cease to be financial solicitors and be able to take this ground if once their productive endowments were adequate, their working equipment sufficient, and the size of their college so limited as to quiet the ambition for mere numbers Such a degree of content with outward conditions will never exist as long as there is the stimulus to outgrow a proper and normal plant. To secure such content there must be adopted, as is now proposed, a policy of intensive college development.

The two remaining propositions, the limitation in number of the student body and admission by a competitive process, are interdependent. Granted that the maximum of an entering class is arbitrarily fixt, those applying (unless mere priority of date of application is to control) must necessarily be sifted, and if the limitation amounts to anything the best among the applicants, up to the number needed, will be chosen. Whether this result is secured by competitive examination, or by the choice of those whose certificates show the most creditable preparation, or of those whose preparatory record otherwise shows the greatest capabilities, the fact is that by some selective process the best only among the applicants will be received. Admission will then mean something real, and the limitation will be fully justified if the work in the college itself can be made of such a superior type that membership in such a college will mean excellence and its degree will be truly distinctive. If any board of trustees will exercise the discrimination and courage properly to apply such tests to the work in their charge, and to establish such standards and keep to them, they will win the approval of many doubting parents and will develop an American college unlike any we have had in the thoroness of its work, the influence of its faculty, and the character of its graduates. The problem seems not to be whether any college will be able and willing patiently to attempt this, but what college it will be.

New York City.

Country Town Sayings

BY E. W. HOWE

[In our issue of February 2nd we devoted an editorial to chronicling our regrets at the retirement of "Ed" Howe from the editorship of the *Atchison (Kansas) Globe*. Since the first of the year he has been living at "Potato Hill Farm," a few miles out of Atchison, where he is writing, setting up and publishing all himself, *E. W. Howe's Monthly: A Farmer's Magazine for Town People*. Two issues of this unique periodical have already appeared, but we hasten to express the hope that not many of our readers will subscribe for it, for Mr. Howe quit the *Globe* solely to get rid of the newspaper grind, and he announces that if his new venture is too successful, he will quit that too. Besides editing and farming he has, in the last three months, written a play founded on his novel, "The Story of a Country Town," published a quarter of a century ago, and has prepared a new volume entitled "Country Town Sayings" (Crane & Co., Topeka, Kan., $1). This latter book has just been sent us for review. Instead of giving it the usual notice in our literary columns, we have selected from it at random the following paragraphs. We merely add that those who are interested will find in the book 298 pages just as good.—EDITOR.]

THERE is an unwritten law among women that no woman should go farther than two blocks from home with a shawl over her head.

A woman is as old as she looks before breakfast.

You hear every day of women who are "crazy to get married." You rarely hear it of men.

About the ugliest creature on earth is a tall, slim boy wearing spectacles.

A thunderbolt never yet fell from a clear sky.

We don't believe we ever knew any one who was not properly punished.

When we look at some men who say they were sent to save the world, we can't help laughing.

Nothing pleases a woman quite so well as to look so sweet that a man wants to kiss her, and then abuse him for his impudence.

Don't be ashamed if you can't play the piano; be proud of it.

Every time a woman disappears into the kitchen she comes back eating something, but she eats very little at the table.

A woman looks prettier putting a baby to sleep than she does on a public platform.

You may easily play a joke on a man who likes to argue: agree with him.

Do something for the town in which you live, and you will do something for yourself.

When married people do not look squarely at each other when they speak, and refer to each other as "he" or "she," there is trouble in the air.

After every picnic, whether there was a chaperon or not, a new hugging story comes out.

Every woman hates the word "female."

Put cream and sugar on a fly, and it tastes very much like a black raspberry.

When a man begins to tell you a long story, a good way is to say, "I've heard it."

Families with babies, and families without babies, are so sorry for each other.

The average farmer dearly loves an oyster stew.

A woman complains that every time she is with the men one of the number wants to explain how a steam engine works.

If a man looked like the pictures in a tailor's fashion plate, people would set the dogs on him.

If you see something that no one else sees, or hear sounds that no others hear, that is what it means to go crazy.

About the only excitement in Atchison today is this: A man who was lately operated on appeared on the streets, and people fear he is out too soon.

There is usually enough of everything on the table except cream.

A MAN'S HOME FOR A MAN.
From the piazza of "Potato Hill Bungalow," Mr. Howe looks out over thirty miles of the Missouri Valley.

If there were no schools to take the children away from home part of the time, the insane asylums would be filled with mothers.

Whenever a widower's name is mentioned, it recalls the names of many women said to be chasing him.

Every country town man who gets East has his picture taken with Niagara Falls for a background.

Next to the man with a clammy hand we despise the man who shakes hands sideways, the usual custom being to shake hands up and own.

A white dress should not be worn more than one day. We are not a woman, but you bet we can tell when a white dress needs washing.

When a doctor assists at an operation, he is as particular to have it mentioned as a woman who assists at a reception.

After a woman has powdered a long time, her face has a purple look, like a boy's chin when he stays in swimming too long.

If the women had money, how well they could get along without the men!

How early do mothers begin spanking their children? So far as we have been able to learn by inquiring among mothers, it is necessary to begin spanking girl babies when about a year old and boy babies when about sixteen months old.

Card playing is more foolish than wicked.

The stuff used to kill a smell is usually worse than the smell.

So far as is known, no widow ever eloped.

How sweet the short girls look when they are seventeen or eighteen! But after they begin to get the middle-age spread they don't look so sweet.

Patent medicine advertisements are attractive reading for women because they have a great deal to say about women who Suffer in Silence.

Music uplifts me, but I drop back again as soon as the music is over.

The more worthless a man, the more fish he can catch.

The younger your daughter, the more apt she is to love you.

Nearly every baby kills a kitten by loving it to death.

About all some men accomplish in life is to send a son to Harvard.

Every woman thinks she has a natural taste for arranging a bouquet of flowers.

We shall always admire the women because so few of them are known as "professor."

A boy is a natural born outlaw when it comes to bathing. Unless his mother stands over him with a switch he won't take one; and after he is grown, and married, he neglects bathing when his wife leaves home.

A man has his clothes made to fit him; a woman makes herself fit her clothes.

A man who never attempts to sing at any other time will break out when in a picnic wagon.

Nearly every bride wears a wedding dress that is beyond her father's means.

When a woman is on her last legs she starts a boarding-house; a man starts a fire insurance agency.

A man who owns a sleigh is willing to freeze to show it off.

We saw a woman crying on the streets today. Probably we men have been doing something again.

Look at any man's clothes, and you will find from seven to seventy-five spots that should be removed.

We have noticed that the sort of man known as an iconoclast is pretty apt to finally get into serious trouble.

Before we die we hope to see a house with an oak finish upstairs. All the better class houses have an oak finish downstairs, but we have never seen one with an oak finish upstairs.

Nations go armed; but citizens must not.

What a servile creature a rich man is when he meets a man who has more money than he has!

Every day thousands of people exclaim, "I can't stand it!" But they do.

Sometimes I think I have nothing to be thankful for, but when I reflect that I am not a woman, I am content. Any one who is compelled to kiss a man, and pretend to like it, is entitled to sympathy.

Don't tell a good story, even tho you know one; its narration will simply remind your hearers of a bad one.

In draping things, and in arranging flowers, every woman thinks she has particularly good taste.

Nearly every unsuccessful man we ever met was a good billiard player.

How fearless and plain-spoken a man is in talking to his women folks!

It is more trouble for a woman to wash her head than to do the family washing.

Why are women's stockings so long and men's stockings so short?

About the only excitement out in the country is to say at the breakfast table: "The dog barked last night as tho some one was prowling around the house."

A woman's hand may be pale and delicate, but she can pick up a hotter plate than a man.

I once wondered how the banks made their money, but when I procured a loan I found out.

A young Atchison girl who will become a teacher said today: "I am not becoming a teacher to do good, but for the pleasure of whipping the boys."

There never was a man so patient that it didn't make him mad to get a line under his horse's tail when out driving.

At a dinner party it is always expected that the guests will talk about literature.

There is no good fishing, and there are no good times.

Probably this expression is used oftener by people than any other: "Everything is blamed on me."

School children laugh as quickly at the teacher's jokes as church people laugh at the jokes of the bishop.

A woman harnessing a horse acts as awkwardly as a man putting on a baby's clothes.

You are familiar with the manner in which a mother makes a fish-hook out of

her finger, and dives down into the mouth of her baby when it has been eating anything behind her back.

What has become of the old-fashioned country horse that had its tail eaten off by calves?

The young men say poor girls are more affectionate than rich ones.

What is the exact age when it is no longer proper for a girl to straddle a bobsled and put her arms around the boy in front of her in coasting? A number

"ED." HOWE OF ATCHISON.

of big girls in town are still clinging to the practice.

How good a yawn tastes at about 10 o'clock in the evening, just before going to bed!

Every married woman looks as tho she needed a little more love, but what she really needs is a little more money.

As soon as it is apparent that a young man is in society for the ice cream there is in it, he should be turned out. The object of society is to marry young people off, and they should pay attention to it or stay out.

"She looks," we heard a woman say today, "as tho she had been buried, and dug up."

If you are on confidential terms with almost any family, you discover they are terribly hard up.

After a man has said "grace" at a meal some time is required for those around the table to become comfortable again.

Maybe one girl in fifty has two men to choose between, but we don't believe the girl ever lived who had her pick of three.

How a little girl loves to say to a little boy, "Oh, you are going to catch it!"

Every town has its men who take pleasure in running after other men's hats when they blow off.

When a friend is in trouble, don't annoy him by asking if there is anything you can do; think up something appropriate, and do it.

With all its meanness and dirt, we rather like Chicago.

What has become of the old-fashioned farmer who caught the woman school teacher who boarded at his house and washed her face in the snow?

When you were a boy, did you have any financial dealings with your father? If you did, they were conducted on this plan: Your father gave you a calf. When you had taken care of it for some time, and it became a cow, he sold it and put the money in his pocket. Almost every boy has a grievance of this kind against his father.

When a woman drives a horse she is always whipping it with the lines.

When a boy goes to school wearing a new pair of shoes, all the other boys spit on them.

A man and wife have no sooner reared children of their own than they have to begin over again with their grandchildren. Old age, that should be free from cares, has more cares than any other time of life. There are at least fifty women

in Atchison who make nursemaids of their mothers.

A girl's idea of modesty is to let loose quick when she shakes hands with a strange man.

When a man buys a new hat he wants one just like the one he had before. But a woman isn't that way.

When a woman gives a party she figures on twenty-two guests to the gallon.

When a man takes off his socks you can usually see a scar on his toe, where he cut it as a boy.

I lately saw a long list of things people shouldn't do. I do every one of them.

The eternal feminine question: "How much is it a yard?"

Occasionally a man finds his wife looking in a certain Queer Way, and when he asks, "What is the matter?" she looks at him a moment, bursts into tears, and replies, "Nothing."

We never could get up much enthusiasm over the militia.

Four Atchison sisters have worn the same dress to be married in. This is the right way to treat a father.

An Atchison man who was told he should not say "widow woman," as it is improper, now says "widow lady."

We know an Atchison girl so tanned, sunburned and freckled that we cannot resist the conclusion that she has been in swimming.

We have always found it a pretty good rule to avoid an "intellectual treat."

Nearly every man says of his dog: "His father cost a thousand dollars."

We suppose there never was a married woman who did not say to some one, at some time, that if it wasn't for the children she would leave him.

A girl should be given an allowance every week, if it is not more than 50 cents. It will teach her how to handle the great sums intrusted to her care when she marries.

"No woman," said a late novel, "should marry a man who cannot help her reach the hights." How the women love that sort of thing!

If you own a Jersey cow, and it has a heifer calf, that's a sign that you are lucky. Most Jersey calves are gents.

If you want to make a man very angry, get some one to pray for him.

The better a pie tastes, the worse it is for you.

A man should be taller, older, heavier, uglier and hoarser than his wife.

Why is it that so many girls are Episcopalians, while their mothers belong to other Churches?

Women like to attend weddings, to hear the big, sweet, juicy promises the bridegrooms make.

You can do more for yourself than any one will do for you.

When father has charge of the baby its face is always dirty.

Some people never have anything except ideals.

There is to be a party tonight, and this afternoon a woman called up her husband and asked, "What shall I wear?" "Never mind now," her husband replied, "don't be coy. You're going to wear that old black dress, the only thing you have, and you know it."

What has become of the old-fashioned man who said to his boy: "Pull off my boots, son, and the next time I see a dime rolling up hill I'll give it to you"?

Every woman imagines that she is an ideal sickroom visitor.

Another girl who took piano lessons, expecting to go into society, has turned out a stenog.

We believe the old war between men and women grows fiercer every year.

If we were a woman, we don't believe we know a man we'd marry.

One of the griefs of my life is that when I drive, vagrant dogs run after me and bark, and I have never been able to hit one of them with the whip, altho I always try.

You can pick up a boy's school book and find instantly where he is studying. Every page he has passed over is full of marks and dirt.

Almost every public speaker mentions his dear wife, and the fact that he has been abroad.

We never knew a man who could keep a horse decent looking in winter time.

Nothing looks prettier on a woman than a white apron with a big bow at the back.

A Protestant preacher's idea of great success in his work is to convert a Catholic.

"She is the kind of a woman," said an Atchison woman today, "who never fills a lamp until she is ready to use it."

A man can feel in his pockets at any time and bring out a little ball of fuzz.

ATCHISON, KANSAS.

Motoring for People of Moderate Means

BY W. F. DIX

AUTHOR OF "THE FACE IN THE GIRANDOLE," ETC.

A DOZEN or fifteen years ago, in the good old days of bicycling, when pony carts for the children and carriages for grown-ups were safe upon our highways, and the surfaces of our country roads were not lifted up by the suction of whirling, rubber-tired automobile wheels and wafted by the vagrant breeze over the surrounding scenery, the burning question was, "Shall I use my bicycle another season, or exchange it for a new one?" Today, in this more luxurious and costly age of motordom, the same question arises in a larger phase: "Is it the better policy to turn in my motor car every year or hang on to it for several seasons?"

Every motor car owner is harassed by this question, yet it seems to me the answer is reasonably obvious, to those motorists at least who must carefully watch their expenses. A week after one has bought a new car and used it, it becomes a second-hand one. Nine-tenths of the first year's depreciation in value can be written off after the first run. Likewise the first year's depreciation is far in excess of the next two or three years, so I believe that the motor car owner of moderate means will do well to keep his car just as long as it runs, and to get all the mileage out of it. If the man who owns this spring a this year's or last year's car in good order will be contented with it for three or four years more, he can then give it away to his best enemy and be set back in his bank account much less than if he turns his car in every year for a new one.

I believe that the car of 1914 or 1915 —perhaps even the car of 1913—will be a vast improvement over this year's in several respects. I fondly dream of owning a car in a very few years which shall be absolutely self-cranking in all weathers; that even in winter I can go out to the garage of a cold morning, take my seat, touch a button or turn a lever, and start the motor running. I believe that kerosene lamps will be replaced with electric ones; that the car will generate its own electricity for lighting and ignition; that tool boxes, extra tires, prestolite tanks, change-speed levers, touring trunks and other hardware will be swept from their disfiguring positions on the outside of the body and be kept in dustproof compartments inside, and that the inartistic and unharmonious lines of the present style of touring car body will be supplanted by a smooth, graceful, cigar-shaped form, a slender ellipse, beginning from in front of the radiator and ending in the rear. And the fairest dream of all to the motor owner is that the everlasting nuisance of changing tires on the road will be done away with, and that some system of plunger springs or other device will allow the use of hard rubber tires.

When these idyllic dreams shall become realities, the motor car will be used by the owner all winter long, whether he is fortunate enough to be able to have a

chauffeur or not, and many more women will enjoy driving.

This is the season of the year when the wanderlust grips us. For months we have had too little exercise and too much work, when cold and storm have kept us immured in office and home, and when Kipling's poem, "The Feet of the Young Men," makes a strong appeal.

"Then we go, go, go away from here!
On the other side the world we're over-due!
'Send the road is clear before you
When the old spring fret comes o'er you
And the red gods call to you!"

The old spring fret against constraint is strong upon us. We long to get out into the woods and to see the burgeon of virginal green upon the trees; to perspire the poisons out of our systems; and to sit at the throttle and fly out into the country side. The red gods are the red corpuscles in our blood beginning to dance. We take the car out of its cold storage as soon as the first mild weather comes, clean the spark plugs, fill the grease cups, grind the valves and anxiously watch the snow and mud grow less on the roads. Those early spring runs, how delicious they are! What promise they give of summer joys to come!

The motor car is no longer merely the toy of the rich; it is a practical and useful vehicle for the man of moderate means. The question, How much does it cost to run a car? can be answered just about as definitely as such questions as, How much does it cost to spend a summer in Europe? or How much does it cost to live in the suburbs? It depends altogether upon the personal equation. A man's motor expense account reflects his temperament and habits and means just as accurately as any other account of running expenses. Two men may buy the same car at the same time, use them in the same general way, and one's expenses may be double that of the other's. If a man uses common sense, looks after the lubrication of his engine, saves wear on tires by going slowly around corners, attends to every squeak or sign of friction at once, starts and stops gently, and gives the same interest and care to his car that he would to a valuable horse; if he refrains from buying a new car every year or so, deducts what he would pay the cabman and livery stable if he had no car, and drives himself, he should secure a maximum of health, pleasure and luxury for himself and his family, for far less than he could secure these in any other way.

A motor car is, in most cases, a luxury, and if a man, after trying out the sport for a season or so finds he is not paying his bills with the cheerful feeling that it is money well spent, if he feels uneasy at the expense, he should sell his car and go back to the livery stable, the bicycle and "shank's mare." He should frankly charge to expense of upkeep the loss of interest on the investment, a depreciation of about 25 per cent. of the cost of the car each year, cost of his automobile insurance and his license fees, as well as the regular running expenses, and the purchase of such accessories as lap robes, fur coats, gloves, road maps, and so on. In other words, he should charge up every item of cost which ownership of a car entails.

I have a friend who bought a car last year for about $1,700. He drives it himself and has run between five and six thousand miles. His own health and that of his children have improved, and he believes he has saved doctor's bills. He knows he has saved livery stable bills, and that his family have all derived the greatest amount of pleasure from the car. His actual running expenses have been as follows for the year:

Gasoline, oil, kerosene (for lamps) and dry cells	$109.00
Occasional storage and services of chauffeur and cleaning car	53.00
Repairs and adjustments	18.00
Tire repairs, $12; two inner tubes, $18; one shoe (a "second") $30	60.00
Total	$240.00
Average per month	$20.00

This does not, of course, include the items spoken of in the preceding paragraph—depreciation, loss of interest, etc.—which would amount roughly to about $560, or a total of $800.

I have another friend who bought about the same kind of a car at about the same time, and his actual running expenses, not including the depreciation, loss of interest, etc., came to 50 per cent. more than those of the first man, yet

he only drove his car about 2,500 miles. These are fairly representative cases, I think, and are interesting as showing what has been the actual cost of maintaining a moderate price car under present conditions.

If a man feels that he can easily afford the expense of keeping a car and enjoys its use, there is no mode of recreation which, when properly indulged in, brings in more thoro enjoyment and benefit to the entire family. The speed maniac is passing, engine breakdowns on the road are practically a thing of the past, the era of hysteria has been replaced by an era of common sense, and more and more the automobile will become a delightful and useful adjunct to our social life. Here's to its golden future! Long life to the motor car and health and happiness to its swelling army of votaries!

NEW YORK CITY.

Men We Are Watching

BY A WASHINGTON JOURNALIST

The New Secretary of the Interior.

THREE recent appointments to important posts in the executive department have attracted wide attention, pleasantly indicating the increasing interest which the country at large is taking in the administration of its affairs. The retirement of Mr. Ballinger from the President's Cabinet left open the office of Secretary of the Interior, and the storm which has been raging in that quarter during the past two years rendered almost every one alert as to who the new Cabinet officer would be, and more or less personally interested in the appointment. There were two distinct attitudes which the President might have taken in making a choice. He followed the least probable but by far the most generally acceptable, and it is safe to say that better or more nearly universal satisfaction has rarely been felt than in the selection of Walter L. Fisher. The President has himself said that he expects Mr. Fisher will prove an ornament to his Cabinet, and apparently no one has the slightest fear that he will be disappointed.

The appointment was pleasing to the great majority because, first of all, the new Secretary is an ardent conservationist, in which he is sure of popular approval. He has been president of the National Conservation Association—the position now held by Gifford Pinchot—and is still one of the vice-presidents of the organization. He may not agree with Mr. Pinchot upon every point, and is free to say that he does not, but they are warm friends and Mr. Fisher is an ardent believer in the same general lines, which cannot fail to bring assurance to many who have realized deep regret in the past that our national resources have been so lightly and carelessly handled.

Secretary Fisher also comes into the Cabinet with the reputation of being one

Copyright by G. V. Buck.
WALTER LOWRIE FISHER,
The new Secretary of the Interior.

CHARLES DEWEY HILLES,
The newly appointed secretary to President Taft.

of the strongest practitioners at the Chicago bar. He has been an important factor in much of the most conspicuous litigation in Illinois during the past ten years and a prominent figure in many of the great reform movements. He is a remarkably clear, boldly aggressive and convincing speaker, masterful, fearless; an impersonation of self-reliance, with every confidence in his own ability to carry out that which his judgment and conscience approve. He is a man of wealth and the broadest public interests; an instinctive leader, with all the requisite courage and energy to initiate, defend and accomplish.

Personally there are few men as agreeable in contact as the new Secretary. He is easy of access, cordial and captivating. You meet a tall, strong man, of positive and impressive personality, with a striking face, smooth shaven, a full forehead capped with a vigorous growth of hair, over remarkable eyes which catch and hold you, indorsing a friendly smile constantly hovering about the lips. You know at first glance that the man is your friend—if you deserve it—and you are not mistaken.

He is an out-of-doors man. The atmosphere of the woods surrounds him. He is a baseball and football enthusiast and a confirmed golfer. He was born in West Virginia on the Fourth of July, 1862. That ought to make him nearly forty-nine, but it doesn't—not within years of it—and still there is no denying it, for, almost boyish tho he is in appearance, he is the father of a family which for these days is simply colossal, ranging from the older lads, in college, to baby Ruth, in the cradle, with—I'm sure I'm not mistaken about it—five boys and a girl between. His wife, once Miss Mabel Taylor, of Boston, is one of the most popular and admired of Chicago's charming matrons.

On the whole, with precious few exceptions, the country is well pleased with the appointment and there is little doubt in the minds of those who know the new Secretary that it will be better and better pleased as time goes on.

The New Secretary to the President.

Since Cortelyou and Loeb made a mountain out of something more like a molehill, it has become a matter of distinguished honor and of tremendous responsibility to be secretary to the President. There are those who believe, with good cause, that it would be easier to be the President, and done with. The fact that an effort was made in the last Congress to change the name of the office to Assistant President, and raise the salary to $10,000, indicates a growing appreciation of the fact.

No one understands better than the President himself how much the success of his Administration depends upon his secretary; and when a man like Norton finds one year of it enough for him, it is little wonder that Charles D. Hilles, Assistant Secretary of the Treasury, hesitated before abandoning the offer of a tempting position in New York, which he was considering at the time the President appointed him Norton's successor. Like Norton, Hilles has made good in the Treasury in a way to attract wide

attention to his unusual ability. He has had more practical experience in politics than Norton, as well as a most remarkable career in the management of juvenile delinquents, which, in a way not overly far fetched, may prove of great value to him in many of the predicaments which will encumber his new position.

He was born in Ohio forty-four years ago, and his first experience in public service was as secretary to the superintendent of the Boys' Industrial School, in Lancaster, Ohio. In 1900 Governor Nash appointed him superintendent of the school and secretary of the board of trustees. Two years later he became superintendent of the New York Juvenile Asylum, founded by Peter Cooper, with the custody of 1,200 street children. Assisted by Mr. Williams, Mr. Hilles founded and established the Children's Village, at Dobbs' Ferry, with an investment of $1,300,000, an intensely interesting triumph of educational and corrective philanthropy, representing the most advanced development yet suggested by penologists. Mr. Hilles is still president of the board of directors, a member of the National Conference on Charities and Corrections, a director of the Play Grounds Association of America and of the Fort Slocum Branch of the Y. M. C. A. He is a Mason, a member of the Loyal Legion and of several prominent New York and Washington clubs.

Hilles adds another healthy, handsome, vigorous man to the President's official family. He believes in sunshine for health, mentally and physically. He carries it with him and dispenses it freely. He has a strong face, smooth shaven, with quick, keen, expressive eyes, a firm jaw and mouth indicating the courage of his convictions. His thick brown hair is just gathering a first touch of gray. He stands erect, moves quickly, speaks deliberately, carrying constantly the conviction that he means what he says and is ready and able to substantiate it. He has a wife and three children. Secretary Hilles possesses many of the qualities most necessary to a successful occupant of his new office, with a personality and record thoroly indorsing a wide circle of friends who feel that he will not only make good, but will lift the office to even greater importance. Every one who knows Mr. Hilles wishes him unlimited success.

Frederick W. Lehmann, Solicitor-General.

It is not often that events conspire as at present to create such universal and practical interest in the Supreme Court of the United States and in those whose activities center thereabout. There is such a proportion of the Justices comparatively new that the Court is an unknown quantity, attracting attention, but it is more on account of the great number of important national questions crowding before the tribunal for consideration and settlement. There is hardly a locality—hardly a citizen—not more or less interested in some of these questions, and all are earnestly watching the new Solicitor-General, Mr. Frederick W. Lehmann, whose distinctive duty it is to prepare, present and argue these cases.

Mr. Lehmann is also comparatively

SOLICITOR-GENERAL LEHMANN.

new to most of us, tho he has a very vigorous reputation thru Iowa and Missouri, for this is the first public office with a salary attached which he has ever held. He is foreign born and a Democrat, which rather surprised some, but his democracy is of a very independent kind. He is a sturdy, pugnacious combination of conservative and radical; we all know of his successful fight for Governor Boies, against Dolliver, Cummins and the rest of them, in Iowa; of his forceful support of Folk, Democrat, against the Old Guard, in Missouri; of his repudiation of Bryan and his support of Governor Hadley, Republican; so we wondered—as we had the right—when he was appointed Solicitor-General, with all the important matters coming before the Supreme Bench. But it was not for long. His first appearance before the great Court was a revelation. He spoke for three solid hours on one of the big trust cases. There were no pyrotechnics, neither was there a moment lacking intense vitality. With a marvelous clearness and strength he presented the Government's contention. He cited opinions and gave references hour after hour without one single note of any kind to guide him or refresh his memory.

Those first impressions proved correct and the better and longer we have watched the more the wonder has grown that one brain can carry all he knows and one tongue dispense it with such ease and force. Those who have watched most closely and intelligently confirm the conviction that at this important hour Solicitor-General Lehmann is the right man in the right place.

He was born in Prussia, fifty-seven years ago, and is particularly proud of the fact that he began life there as a shepherd boy. It was only a brief experience, however, for very early in his life his father brought him to America and settled in Ohio, later going to Iowa, where, still only a lad of twenty, he took his first degree at Tabor College.

On the solid and healthy foundation of the shepherd boy Mr. Lehmann has developed a rugged, powerful man, mentally and physically. Body and brain seem both to have absorbed all that was worth having in life, thru their first half century. He has a large, strong face, full of dogged determination, but equally full of human sympathy and friendliness—when there is a chance for it. He has thick, dark hair and mustache, touched with gray; a grand thinking chamber, stored with a mass of general information which is simply bewildering. He is as brilliant a conversationalist as he is public speaker; as captivating in after-dinner wit as he is convincing, profound and effective in legal pleading.

When Mr. Lehmann settled in St. Louis, in 1890, he at once took front rank at the bar of that city. He has been president of the American Bar Association and is now president of the Franklin Club, of St. Louis, an organization of bibliophiles. He has a superb private library and a remarkably fine collection of paintings. He is president, too, of the Public Library Board of St. Louis, and chairman of the Board of Freeholders, which recently completed the new city charter—chiefly the work of Mr. Lehmann. He is a man who has made a success of himself and is very likely to make a success of whatever else he undertakes. At a moment when we need most the best the country is fortunate in acquiring his services.

WASHINGTON, D. C.

In the Garden Today

BY AMOS R. WELLS

I THINK that still, as Easter morn draws nigh,
Damascus Gate, and all the wall thereby,
Must breathe a trembling and expectant sigh

I think the garden places and the street
Passed by the Savior's resurrection feet
Still quiver at the memory high and sweet.

I think the very pebbles glittering bare,
And all the flowers in the garden fair,
Are thrilled as if the Savior still were there.

And who will say He does not there return,
Since in our own glad hearts that throb and burn
His radiant Easter presence we discern?

Reforming Wall Street from Within

BY WILLIAM PETER HAMILTON

Editor of the Wall Street Journal.

AFTER all, there is something sanitary about washing our dirty linen in public. Publicity in itself tends to prevent the production of too much dirty linen. It may be pointed out, however, that the quantity is more limited than most people think. The process, moreover, has such morbid attraction for certain earnest minds that we have produced a kind of literature devoted to the deliberate search for dirty linen; and one even capable, in response to a stimulated demand, of manufacturing it to order. It seems a poor sort of national sport.

It is accordingly without the least semblance of apology that I venture to discuss the advance of Wall Street, and in a way which would have little attraction for the publications I have in mind. There must be a large number of thinking, if inarticulate, people, however, who would like to hear a story of regeneration, and there is something of which we may well be proud in the improvement made in Wall Street, almost wholly from within, in recent years.

Even the Wall Street of twenty years ago, as its most rabid critic would allow, was incomparably cleaner than the Wall Street of the early seventies—of Daniel Drew, Jim Fisk and Jay Gould—where a condition existed which created a just distrust for so-called "financial" methods in the breasts of honest people, the odium of which has clung to Wall Street long after the cause has passed into oblivion. The looting of the Erie, the sale of securities possessing no real lien or value, the protection of such methods by the aid of corrupt judges and the cooperation of the vilest element in politics —the phenomena of Wall Street at its lowest depths—were at least no longer possible, even in the early nineties. The condition which existed prior to the reorganization period of 1893-1896 was gravely lacking in security compared with that of even ten years ago. The improvement in the past five years marks an acceleration of this entirely perceptible and definite movement in the right direction, with increasing control by the best elements in the financial district.

As a nation we made money too fast

at many stages of our career to take much thought of the right spending of it, or even of the methods by which it was made. Let us remember that it is only in recent years that, with certain noble exceptions, our best intellect has been attracted into politics. Office was no reward for men of great abilities and ambition. A republic has no titular honors or social precedence in its gift. For a long period in our history posts of dignity abroad were the perquisites of the professional politician. We cannot bestow upon brilliant success the dignity of a K. C. B. or the cross of the Legion of Honor; we cannot make a Chevalier of the Golden Fleece or a Peer of the House of Lords. What our system can give is money, and ambition is directed to the greatest thing money can buy, which is power.

I am inclined to think that the periods of deepest degradation in our financial life have been coincident with the inflation accompanying periods of great production and prosperity. Reaction and reform have generally followed. The panic of 1873 wiped out some of the vilenesses of the Drew-Fisk period. Corresponding housecleanings could be traced in subsequent periods of humiliation, and we may at least say with confidence that each of them has left the house cleaner.

In the Wall Street of today, one great principle has at last asserted itself so visibly and obviously that no financier can ever pretend to ignore it. This principle is that corporations, whatever their nature may be, are greatly more profitable when they are honestly and publicly managed. This sounds elementary, but the truth goes deep. Railroads in the past five years have borrowed money by the issue of 4 per cent. bonds which could not have sold, fifteen years ago, the best security they could devise, even on a 6 per cent. basis. Within the past few years the Chicago, Milwaukee & St. Paul converted into preferred stock, dollar for dollar, maturing 7 per cent. bonds which it had been unable to sell at the time of their emission, even with such a high rate of interest, without attaching what was then regarded as a somewhat shadowy privilege. The bondholder, nevertheless, received in preferred stock nearly twice the original investment, and that stock sold above 192. In no place in the world is honesty such good policy as in Wall Street. In no market in the world is the integrity of a contract more relentlessly enforced than in the Stock Exchange. Fights for power have involved the ruin of rich men, but they were not aimed at the dishonest exploitation of the small investor, who suffered relatively little in 1903 and 1907.

Some ten years ago we were confronted with the problem of a large number of men, possessing in cash or cash assets more money than they had ever dreamed of in their lives before. This was a consequence of a succession of great crops and of the enormous industrial expansion which followed the period of enforced retrenchment and saving in the years after the panic of 1893. The dilapidated and almost obsolete mill had become part of a combination, which in turn was taken into a larger organization, finally to be merged into the United States Steel Corporation, or some like company, capitalized at figures which made us stagger in 1901. Wall Street was full of wire kings, copper kings, nickel kings, sugar kings—enough titles of the kind to justify the famous Gilbert and Sullivan song which proves that when every one is somebody, then no one's anybody. They "played" the stock market like a faro game in a mining camp. They were willing to pay high prices to be shown new methods of extravagance. They demoralized all service with which they came in contact. They were a nuisance of the worst kind, but their enormous financial power made them an invaluable following for any enterprising leader able to consolidate their strength.

One relentless fight for power culminated in the Northern Pacific corner and panic, in May, 1901. Similar campaigns developed in different directions, until it almost seemed that some single leader would ultimately unite under one hat the control of all the railroads of the United States. When E. H. Harriman devoted the profits the Union Pacific had made out of its holdings of Northern Securities to the purchase of stock in neighboring railroads, or even of roads only remotely connected, the wonder was how far Mr. Harriman could extend his

power. He seemed to rule any board of which he happened to be a member, so astonishingly did his personality dominate his associates. He never himself, even at his death, owned sufficient capital to control the Union Pacific alone; but his genius in railroad management drew to him a following of rich men such as no leader had ever commanded before. What the misguided popular imagination has made Mr. Morgan in the American banking world, E. H. Harriman was in fact in the American railroad field. The wisest of us wondered where the process of aggrandizement was to stop, and failed to realize then, easily as we ought to see it now, that disintegration is a principle just as active as concentration, and can be as definitely traced in the developments of the past ten years.

Ten years ago the Pennsylvania Railroad controlled, by a majority of the stock, the Baltimore & Ohio, the Norfolk & Western, and, with the Vanderbilt interest, the Chesapeake & Ohio. The last named is now one of those smaller systems dominated by Mr. Edwin H. Hawley, who, after all, is not a Harriman, but a broker in railroads; while the others are independent properties. Nobody possesses a controlling interest in the Pennsylvania, nor could such voting control be shown in the other roads I have mentioned. More than this, there is no voting control in Union Pacific. Judge Lovett is the president, helped doubtless by weighty advisers. But their advice is followed because it is good, and he exercises his office on his merits, presumably to the satisfaction of all the stockholders, great and small. I do not believe that the Hill interest could show a voting control of Northern Pacific. There is no majority control of Atchison or St. Paul. The New York Central holds its controlled roads together for the reason that they are being absorbed into a system which may consistently be run as a whole.

It is in the past five years that Wall Street has realized that there is a point where consolidation reaches its limit of efficiency. Railroads, it is true, avoid wasteful competition as much as possible, altho there is far more competition than the public supposes, even among roads belonging to the same group. The competition between Great Northern and Northern Pacific, two so-called Hill roads, is vigorous. In the same way, banking interests may co-operate in support of the greater requirements of the money market. This does not mean a concentration of control, but merely the intelligent perception of the common needs of a great financial center. When all the banks of the country had practically suspended cash payments in 1907, the banks of New York stood together, and, instead of hoarding their resources, lent them, with a freedom only made possible, under our cumbrous and dangerous currency system, by loyal action under a single leadership. Even the influence of Mr. Morgan in Wall Street's affairs does not amount, and never has amounted, to the autocracy so loudly exploited by the popular magazines and the yellow newspapers. I have shown how widely the ownership of the railroads is scattered. If this or that private banking interest has a casting vote or a veto in their policy, it is exercised in the main for the best interests of the property. Mr. Morgan's or any other control would be lost if it were abused. The day when a railroad was supposed to exist for the purpose of being reorganized every ten years or so, with a $500,000 fee to the reorganizing bankers, has gone by. Wall Street is dominated by an element which proposes to see that that kind of financing does not come back.

But the great improvement is in financial *morale*. The passing of the old bad order was seen in the exposures of corporate recklessness brought out by the life insurance inquiry of five years ago. It was those disclosures which brought the fight to a head. The party of sound finance won. The influence of conservative banking has since grown steadily. The real leaders of Wall Street are not the popular figureheads, but bankers of the type of A. Barton Hepburn or the late J. Edward Simmons. Admitting the power of the great private bankers, it can still be said that their control makes for conservatism, and would cease if it did not do so. Its spirit is the spirit of the better banking practice of later years; and even in the firm of J. P. Morgan & Co. itself we have had a re-

markable instance in point, in the partnership changes made at the beginning of the year. Mr. Morgan is a man of seventy-three, reducing year by year his labors in the great firm of which he is the head. His death will leave an organization, which probably handles more private deposits than the greatest national bank in the country, in the hands of partners the majority of whom have been trained in a school which the most conservative European banking experience would approve.

In the Stock Exchange, that most conservative, not to say obstinate, body, the gain has been great. That vicious old instrument for exploiting the credulous public—the "unlisted department"—has been abolished. Corporations whose securities are dealt in on the Stock Exchange are now compelled to give full particulars of their business, and the listing requirements in this respect are being made more stringent all the time. What was the most unprogressive body in the country has learned that publicity in the long run not only protects the investor, but makes better and safer business for the stock broker as well. The "bucket shop," in the abolition of which the Stock Exchange has done great if unrecognized service, only wants to see a customer once, when it takes from him all he has. The Stock Exchange brokerage house, on the contrary, cannot do enough to retain its customer, or to protect him. Competition, doubtless, has something to do with this; but the Stock Exchange exacts a standard of probity in its members second to that of no institution of the kind in the world. Repetitions of such failures as those of A. O. Brown & Co. or T. A. McIntyre & Co. are now virtually impossible. My belief is that the time is near when the Stock Exchange will guarantee its members, as Lloyds does its underwriters. It has the power to exercise a supervision such as no statute could give it, and any state charter would probably take the power away.

The sincerity of this body's effort to comply with the law is shown by its action in the matter of the stock transfer tax. The tax is a radically bad one, in the respect that it is a burden on a process of trade, tending to drive business out of the State to other stock exchanges. In spite of this, the Stock Exchange enforces a compliance with the law which the State could not exact, as the tax is peculiarly easy to evade by collusive bargaining; but the Stock Exchange rule prohibits "fictitious transactions," and that rule is enforced to the letter. It is encouraging to know this when there is so much talk about "wash" sales, by critics who would not recognize such a transaction if they saw one. To sum up, it will reassure the public to know that, with one impracticable exception, the intelligent recommendations of the White investigating committee are all now incorporated in the Stock Exchange's practice.

All this, remember, has been achieved without legislation or assistance from outside. The greatest reform in banking business of recent years was that which established a weekly bank statement showing the actual condition of all banks and trust companies, and not merely those of the clearing house, in place of the misleading average statement which had previously been published. This reform was achieved because Governor Hughes appointed a competent banker, instead of a politician, to be the State Superintendent of Banks. Without additional legislation, after consultation with the New York Clearing House, the reform was made, and New York has a better and more trustworthy weekly bank return than any financial center in the world. Instances might be multiplied, but the underlying principle of publicity may again be pointed out. We cannot protect the criminal or foolish speculator against himself, in stocks or anything else. Wall Street can, and does in a constantly increasing degree, provide such information upon what it deals in that the buyer has only himself to thank if he makes a foolish bargain. What market for anything anywhere can do more?

Here is the Wall Street I know, and like, and laugh at, and respect. I cannot but think that the people of the United States want to see the real Wall Street—not the impeccable college-endowment factory of Chancellor Pangloss of Syracuse, with his ridiculous "all for the best in the best of all possible worlds"; not

the ravening octopus of the yellow newspaper, grasping everything and giving nothing; not the "Christian men to whom God in His infinite wisdom has given control of the property interests of the country," of Mr. Baer; not the feudal castle with its feudal lord, exacting tribute from peaceful agriculture, blackmail from commerce, tolls from protected banditti, and replenishing its coffers by forays and raids—the image dear to the ten-cent magazines; but the legitimate and indispensable instrument of a great nation's commerce, recognizing its deficiencies and seeking wisely to correct them. Hampered, from no fault of its own, by the absence of a central bank; working with a currency system automatically constructed to cause periodical panics, such as are impossible under the banking systems obtaining in Europe, Wall Street, nevertheless, is making the best of the means to its hand.

Its reliance is not upon "uncrowned kings," "saviors of the banking situation," or other popular ideals of what constitutes financial leadership. It depends upon the integrity of its methods and of its members, and in this respect an international experience encourages me to say that it compares well with any other center, and will in time set a standard of soundness and clean dealing to the whole commercial world.

New York City.

The Awakening Garden

BY E. P. POWELL

Author of "The Country Home," Etc.

THE first time that the countryman throws off his coat, rolls up his sleeves, and with trousers in boots, starts to plant garden he is happy. See the steam that comes out of the ground, and hear the brook that rumbles down the swale, full of melted snow. That will dry up by and by but just now it is needed to make up the sum of joy which all the world feels at the opening of a new year. It is doing its best by turning a lot of mimic water wheels for the younger boys and girls, before it gets to the big mill, where it takes its place in the list of hearty workers. The collie sits on the ground close by watching the process.

It is the first day with the thermometer above seventy in 1911; that is the first day in New York and New England. The planter swings his strong stride across the mellow field, but he turns out for the hens, wears a straw hat of last year's use, thru which he punched in July a good ventilator with his hoe handle. On his arm hangs a basket of potatoes, Bliss's Triumph, a package of Thomas Laxton, and another of Prosperity peas, and in his pocket there is a paper of lettuce seed. He is thinking what a delightful garden he will have and he means to have it as early as the brightest of his neighbors. A little impersonal rivalry is wholesome, but a good garden must not loose its flavor, because a neighbor's radishes get the start.

The ground was plowed two weeks ago, and then came a snow storm that chilled enthusiasm, but it did not hurt the soil. It is that storm that is now running so cheerfully away down into the meadows and creek. The last drifts that were piled in the little hollows on the hillsides are about melted, and the warm shower of last night is lifting a part of them in mist. The ground of this farmer is well drained, as every garden should be, and it has no soggy spots. It looks to the East, as all good gardens should look, so as to catch the rising sun. Go ahead, farmer! You fit admirably into the scene. Plant your future dinners, and get joy and poetry out of the doing it. God made a garden; if you do it well it is piety as well as poetry.

Every bit of this garden, I mean the

very ground itself, was made by the gardener; no I do not mean quite that, but it was made by God or Nature, and it was conserved by the farmer. It is nothing at all worth the while, that anyone can do all alone in this world—nothing but mischief. So you will see that this gardener of ours has destroyed nothing, not even weeds; and he has no need of commercial fertilizers; only enough lime to help the humus become soil. He laughs softly as the brown loam takes in the seed, and he covers it softly, and he sings a snatch of song from Old Cornell. He has been to the Agricultural College, as every young farmer should, and as before long every young farmer will. A thousand breakfasts are here, and he says grace over them all at once—a thousand dinners, and they will come with beauty and grace and love out of the well understood soil. Praise God from whom all blessings flow! Yes, that is it, but they will all come by honest work and by well thought out problems.

The robins have just got here from Florida, they stand up straight to look at the planter; then turn to pull out another worm. They have had the best of it all winter, but home is home, and Florida does not know anything about these April showers, and a New York garden cannot be beat. Down there things are going on all the time, and there is nowhere a beginning to anything. One may pull a radish in September and cut a cabbage in January, and he may have carrots in his soup for March; and so it goes on all summer and all winter—only really there is no winter at all, and one hardly knows whether it is spring or fall.

Big toads hop from under the pie plant leaves, which are already eight inches across; but the toad is as welcome as the robin. Cronk, Cronk, high overhead, the wild geese are going northward, a vital triangle that cuts thru the air with the least resistance. That old gander that leads is king. How finely they follow. A right leader deserves cheerful following. As for me I miss the chaffing of the mockingbird, whose merry whistling and take-offs enliven my Southern planting; but as for this our gardener knows nothing about it. He will soon have the catbird, and a catbird's song has no equal in either New York or Florida, and I have heard him in both States.

There are some yellow coltsfoot in blossom, and some violets by the water trough. These are at the corner of the garden, and the farmer stoops, and gently gathers some to carry to his wife. He stops a moment in his work to smell of them, altho they have not a bit of fragrance. Then he lays them carefully in the bottom of his seed basket. Beautiful thoughts of home, that can be understood only by those who have joined hands for life, make him for a moment forget his pride in garden making.

Just at this moment from the house comes the wife, head uncovered and eyes as blue as the skies. She has hurried her indoors work in order to help in the garden. Why not? She sings, and he whistles. He makes the holes and she drops the potatoes. Why not? Both are the happier and the healthier for working together. I do not think she was up last night playing bridge whist, or in any other way shaming that finest thought of God, womanhood. A man may be bad enough, but a woman who imitates man's worst habits is unendurable.

Our farmer is just short of six feet, and as I told you he has seen the inside of that finest of modern institutions, an agricultural college. So you may be sure he is not just putting into the ground any sort of peas and potatoes that happen handy. Beside the sorts I have named from his basket, I heard him say that he would find a place for the Irish Cobbler, and for a late sort he would take State of Maine. A well balanced judgment of this sort, trained by experiment and experience, is worth more to a common man than all the dialectics of Aristotle or anybody else. It is the common man that by and by will have the education, and its object will be not to make him uncommon, but very much more an everyday fellow. Our gardener's brain, I do not mean his tongue, is very eloquent all the while in its comparison of sorts; and he says, "Little mother, we shall agree on this that no other potatoes go ahead of these two. They are great to grow and delicious to eat."

"Yes, my John," she says; "they burst open in the cooking, and the contents are

as sweet as they are beautiful." Then the two branch off to discuss the peas that they have selected from a half dozen catalogs, as well as from a half dozen years of experience. Dear me, but what delicious hours those are when two sit down to study up the best, and when they resolve to cultivate nothing but the best. With them there is a deal beside eating that is associated with a dinner. I think it goes far into making fine character, this garden work, if it is rightly carried out.

The hens have heard the plow and the hoe, and are coming by twos and by fives, tramping in that funny hen way, to help and to share. I do not know what we should have done if evolution had brought us on to the field before the hen was thought of. It is a wonderfully companionable creature, more so than the robin, and quite as much as the horse. They not only take the superfluous worms, but they lay the compensative eggs. Let us say hereafter, in justice, Our Father, who art in Heaven, give this day our daily egg; and as for bread, why our wives will see to that—for they also go to agricultural colleges. Ah, what a world this will be when industrial education gets a fair grip on us. The hens do not go to college, but they make a larger topic than Horace.

One of the hens goes close to the farmer, and struts along by the side of him, occasionally looking up with a chuckle and a hint. He takes care to throw her the biggest worms that come in reach of his hoe, and I suspect he gives her a few of the seeds in his pocket, for he occasionally pulls something out and drops it that makes her eloquent. The cock tumbles about the garden with less satisfaction than the hens, for he is too self-conscious; but I note that he keeps nearer the little wife So they go, back and forth, and all are very happy.

It comes about with a decent man that everything falls in love with him; not the girls alone, but the fowls and the kine and the horses, and they get about him and find him out, paying him back liberally with good will and help. The farmer says, "Take care, little mother, for the hens must not see where you put the peas nor must one be left uncovered, or they will have them all dug out for sure." Hens are good gardeners, only it will not do to leave them alone. They are good judges of peas and gooseberries. As for the strawberry bed they might as well not know where it is.

But I shall never finish my garden if I keep on talking about my Plymouth Rocks and Leghorns. Well, I have no need, for the children have got home from school, and I can already smell the dinner thru the open door. Oh blessed days when we no longer need to shut the doors to keep out the blasts of winter. Oh blessed days when spring comes with double handfuls of joys, and there is not an icicle hanging from the eaves. The little mother has already left the field, and I can hear the clatter of dishes as she sets the table for five.

"Come, come," she sings; "the dinner is done and there is enough for all." There were big bowls of milk with cream on it, and a pot of hominy, hot from the stove, and the big bubbles still coming up thru. Home-made, all of it; and brimfull of health and strength. Even the joys of gardening cannot withstand the stomach. A meadow lark also comes into the yard, singing among the bushes; and a bluebird calls from the box where he has built his nest these five years past, in the ash tree. This is Nature's way of dining. There is not a spoon of solid silver on the table, but there is music of birds, and of brooks, and the family are all together.

I do not know for what possible reason one of God's gardeners should indulge in luxuries, in high cooking and strength-destroying spices and meats. The man who can pull me a bunch of carrots rich in life giving is far ahead of the chef whose rich compounds make me a grumbling dyspeptic. Let me walk among your grapevines, and dine upon a half dozen bunches of Goethe incarnated, and I shall not ask for the last receipt of petted degeneracy.

That is already our rule, which soon will be the rule of all schools, that there is no afternoon session inside the schoolhouse with books. In half a day the children are taught what they will test and try in the garden or the kitchen; and so they use at once what they learn, instead of

piling a lot of facts on top of each other —like sixteen garrets in a house, all full of old and useless furniture, leaving only one story for living use. Nobody should undertake to exist in the country a whole day without his children. No children should be away from garden making That is the real wisdom, how to grow things. It is better than to know who were the Kings of England from Arthur down to George.

Nine-tenths of all that is worth the while a child learns at home, and all that the school is good for is to supplement the home. It never was intended that children should be separated from their parents, and that the most important knowledge should be swapped for that which cannot be used—and unfortunately cannot be got rid of. What eyes children have! before they are so educated as to merely think, and to see nothing. Do not be alarmed so much about spelling and grammar, if only your boy has good eyes and ears. There is more knowledge strewn around your garden than any schoolmaster ever gathered into books. It is no harm if the boy has a trick of forgetting nine-tenths of what he learns, for even then he will be overloaded with facts got out of books. Forgetting rubbish is one of the lost arts in these days of schools.

If you care to make your children wise as well as happy and healthy, give to each one a garden—a plot to plant and to study on his own initiative. Let him work out himself or herself in ways and results. The lessons learned will be of the most valuable for character as well as crops. Felix has his squashes in holes; well, he will know better next time, and his battle with bugs and ants and beetles is a fight that is worth the while for any lad, and quite as important to the girls. The only thing likely to whip a man is a beetle, or possibly a scale bug. However, not one of them can beat him at brag, nor have I ever heard them debating original sin; to waste time would be insect sin.

Our farmer is still planting his peas, but the hens are strolling back to the barn, and half a dozen are cackling in chorus. The excited rooster has jumped to the top of a fence post and is screeching his pride. I like to hunt eggs just as well as I did seventy years ago, and a cackle at the barn I take to have something personal in it. A new egg is an ideal of art outside, and of evolutionary science inside. It is balanced rations, pretty nearly adding occasionally buckwheat cakes and home-made maple syrup. Each hen comes racing back again, when she has done her duty in the nest, and what yards of worms she has earned. The gardener smiles, and like a good home-maker as he is, calls each one of his pets by name. I think they understand his praise.

Gardening involves exactly what the rest of the home requires, not only preparation for the future but a cleaning out of the past. It belongs to the boys, only the little mother insists on helping, to take the covering from the strawberries and pile the last year's raspberry canes on the asparagus bed to be burned. House cleaning takes in all the world; not merely putting the worst dirt out of the rooms where we eat and sleep, but it takes in this great big room where we grow the vegetables, and where the plums and pears are rocked in the wind cradle. Keeping clean is a law of Nature, and a dirty garden is as great a shame as a dirty kitchen; have a compost pile, and throw into it all the weeds that you pull, and all the wasting leaves and litter.

The sunshine begins to grow whiter, as it does of a right sort of a spring afternoon, and a bit of chill shivers thru the atmosphere. The robins leave off pulling worms, and in the tops of the highest maples, shout glory and peace and good will to all the world. It is a wonderful song, this evening benison of our garden birds. I wish I knew what they are saying. I would rather understand robin language than Greek. At last the farmer stands erect; his work is done. He looks about with satisfaction, and the sunset blazons his brow. He has shown his confidence in that universal Life with whom rests the harvest.

He stretches his limbs, and looks about over the soil and over the sky, glad that night and sleep are to come with rejuvenating powers. Ah, that is it; how shall every one become young once a day; how shall he be full of vitality when the morning sun calls him to his work.

This is the one problem of all others best to solve—how to work enough and not too much—how to use life and not to waste it; how shall one blend rest and toil to get out of them both together more of achievement.

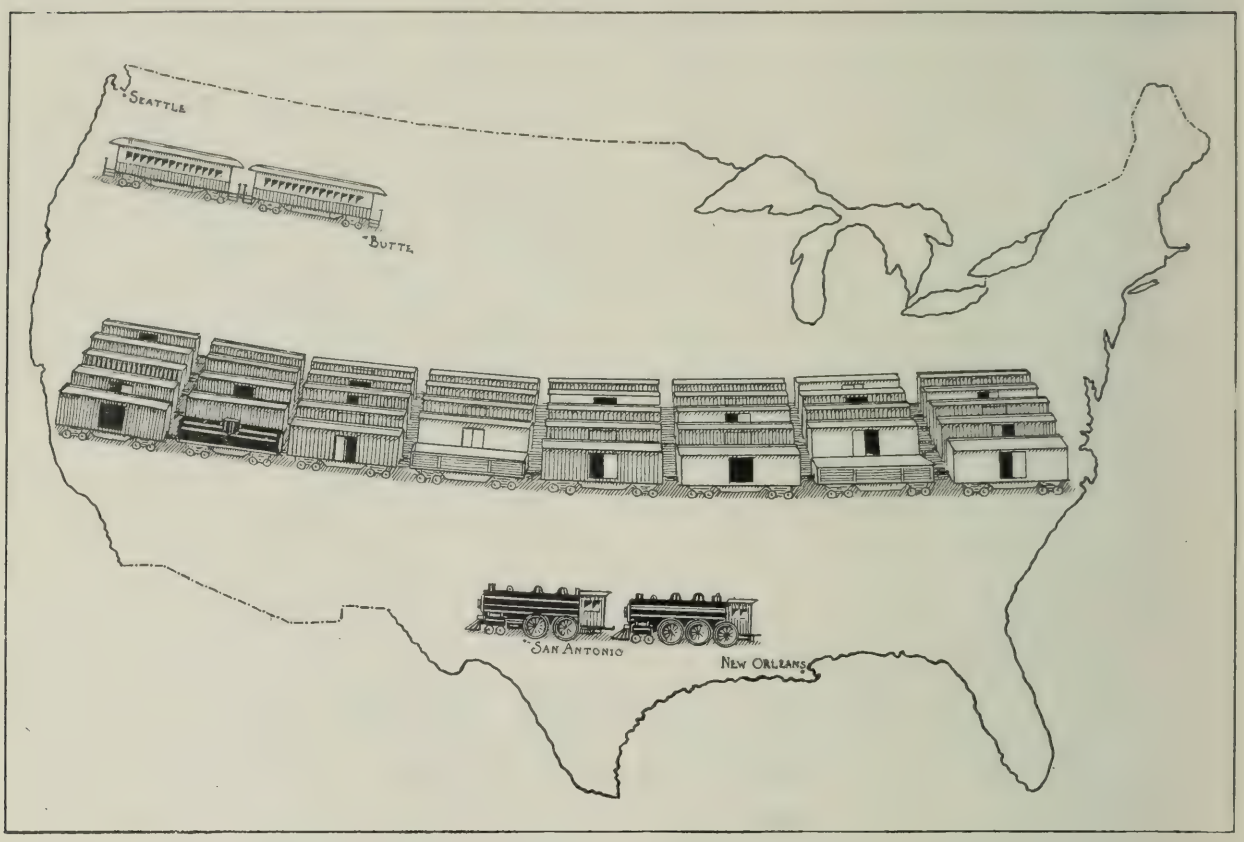
The garden month is delightful, not only because it is a breaking of fetters but because it is the month of faith. The psalmist is made to say that he had never seen the seed of the righteous begging bread; I think that he meant to say that he had never seen the doers of right things, the hearty handlers of the hoe and the cheerful garden makers going hungry. The up-to-date planters of bread-seed are sure of compensation. We need a new definition of piety; for really a life of lazy religion is the most worthless of all things, but in the long run a well-hoed garden is as good a prayer as one can make.

Our gardener has left off stirring the soil and planting seed just early enough to respond to the mellow call of the Jersey cow, and he takes his place at last in the house with a brimming pail of milk. There are two little words joined most often together. They are supposed to embody pretty nearly the sum total of what is best for both young folk and old folk, bread and milk. There is nothing finer in the farm world than a bowl of fresh milk, from your own cow, milked by yourself; and this bowl filled to the brim with home-made bread—only I would add two handfuls of black raspberries gathered by the young folk. Here it is the father and the mother and the children come together in creating food. Here indeed we have the co-operative trinity, and we have the ideal nourishment. Next month, said the farmer, we will put in our sweet corn and our beans.

CLINTON, N. Y.

Some Easter Day

BY EMMA PLAYTER SEABURY



SOME day shall dawn that glorious Easter morn
When love shall reign supreme, and anthems ring,
Proclaiming joy and earth's millennial spring;
The burgeoning of happiness new born;
And countless millions then shall laugh to scorn
The vaunted glory of our age, and fling
Th' accusing taunt that Christ was not our King
And laugh our feeble protest into scorn.
For love of King means love to all mankind,
And love to all mankind, means lifting care,
And giving sacrificial alms in self each day,
Means helping hands to stumbling ones and blind,
An angel's gentle kindness everywhere
To roll the stone of selfishness away.

CHICAGO, ILL.

Our Railway Equipment

BY WILLIAM B. BAILEY, Ph.D.

ASSISTANT PROFESSOR OF POLITICAL ECONOMY IN YALE UNIVERSITY.

IN 1825 passengers were carried for the first time in a railway train in England. The length of the road was 12 miles and the train made this distance in two hours. In the same year Wood, one of the best known writers on railways, said: "Nothing can do more harm to the adoption of railways than the promulgation of such nonsense as that we shall see locomotives traveling at the rate of 12 miles an hour."

In 1829 a locomotive was introduced in this country, and in the following year Peter Cooper experimented with a locomotive on the Baltimore & Ohio Railroad. The flues of the boiler were made from gun barrels. The boiler was about the size of a flour barrel. Cooper related with considerable satisfaction how on the trial trip of this engine he passed a gray horse attached to a wagon.

At present the railway mileage of this country is nearly 250,000. This mileage has an equipment of over 57,000 locomotives, 45,000 passenger cars and 2,000,000 freight cars. A better idea of the extent of this mileage and equipment may be gained when we realize that the mileage is sufficient to encircle the earth with a ten track road, that the freight cars would form five lines stretching across this country, while a person traveling from New Haven, Conn., to Washington, D. C., could pass the entire distance with a continuous line of locomotives on either side, and the passenger cars would reach over 600 miles. The rapidity of the growth of our railway systems becomes apparent when we realize that there are probably a half million people in this country who were born before a locomotive was ever placed upon a railroad track in the United States.

NEW HAVEN, CONN.

LITERATURE

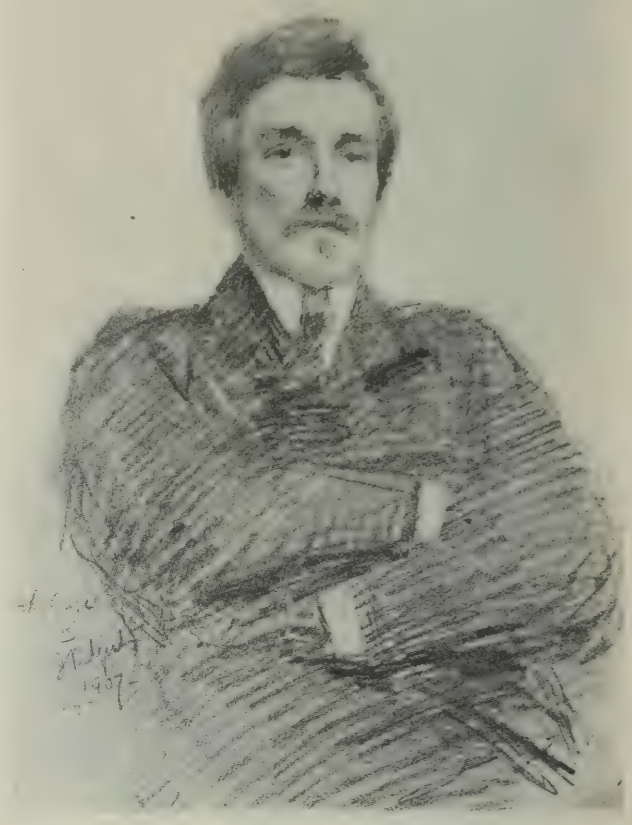
The Making of a Musician

"From behind the house rises the murmuring of the river" are the first words of *Jean-Christophe,** and the river ripples thru many subsequent passages of the novel like the theme of a symphony. M. Romain Rolland has published seven volumes of his great musical romance; the four translated and published form a volume of 600 pages, and a story, complete in itself, of the development of a great German musician. The psychology of genius has had many interpreters, but perhaps none better equipped for his task than M. Rolland, who has an intimate knowledge of France, his native country; of Paris, where he was educated; of Germany, thru travel and the friendship of a gifted German woman; and a critical knowledge of music. Jean-Christophe is from his birth a child of music. His growth and unchildlike struggles toward musical perfection and recognition are told in this volume, and the book ends with the hero's crossing of the German frontier into France, his hopeful eyes fixed upon Paris as the goal of the free artist.

"He could not live in Germany. In truth Germany had suffered so much for so many centuries from having idealism and no fame that she had every excuse after so many trials for making the sorrowful confession that at all costs Force must be hers. But what bitterness was hidden in such a confession from the people of Herder and Goethe."

That is a Frenchman's estimate of the triumphant rival across the Rhine, but there is much of bitter truth in his dissection of the stupid militarism, the brutal arrogance of the officers, the abuse of authority, the sodden subservience of the many to the haughty insolence of the few. An unhappy childhood is an ill preparation for a boyhood of savage struggle for recognition; it leaves the youth too sensitive to slights and disappointments, without the safeguard of memories of sweet and daily beauty in the years M. Rolland calls "dawn," from babyhood to eleven. Jean-Christophe's great wondering eyes see his father's degradation of drunkenness, his mother's wretchedness, his grandfather's disappointment, the squalor of his home and the lack of respect in the neighbors, uncomprehending, yet vaguely unhappy over the failure all his family had made of life. It is a sorrowful story, that of the gifted boy's childhood, but it is the best and most artistic part of the book. The sketches of Jean Michel, his grandfather; Uncle Gottfried of the gentle heart; his brutal father alternating between drunken debauches and fits of tenderness and remorse; the sad and subdued mother, a hauntingly pathetic figure, and small Jean-Christophe himself, so loving, so appealing and so little understood, linger in the memory like fragments of the

THE AUTHOR OF "JEAN-CHRISTOPHE."
Romain Rolland's novel has for its American publishers Henry Holt & Co.



*Jean-Christophe. *By Romain Rolland.* New York: Henry Holt & Co. $1.50.

lieder the lonely little fellow used to compose to keep him company when his mother went out to work. From the first, music was his compensation as well as his unique endowment. Recognition of his talent came more slowly than one would imagine in music-loving Germany, but Jean-Christophe had none of the arts of pleasing, of flattery or subserviency, that bring a prompt success. He is violent and intractable, and his gentle mother has much ado to live with him. A curious parallel between his inner life of revolt and that of Arnold Bennett's hero of "Clayhanger" recurs to the reader. But Clayhanger's inner drama of intense emotion is, for the most part, unsuspected by those about him; except for sporadic flashes, rare and quickly repressed, his outer life is one of conformity. Jean-Christophe's is a perpetual rebellion. It may be just the difference between the ordinary man and the man of genius; repression on the one hand and expression on the other of equally powerful emotions. Each man's life is of intense interest to himself; whether it prove interesting to others depends on how much of the inner drama he is willing to disclose. Jean-Christophe's soul is quite bare. He goes about as tho he were skinned. Such sensitiveness is a disease, and he is hurt by the world wherever it touches him, even when the monster is only in play and means to be gentle. As we have the book to the point of his exile from Germany, two coarse episodes soil the third part, entitled "Youth," and two figures redeem it, the lovable Uncle Gottfried, and the mother, Louisa, who is, from beginning to end, a consistently beautiful portrait. Her shining is veiled by the selfishness of those about her, but without her love, *Jean-Christophe* would be the most sordid of stories.

An Irish Playwright

It is perhaps the thought of the reader who fingers the American edition of the late John Synge's work: "Here is one more poet of Irish nationalism; vague, beyond a doubt; symbolic, whatever that means; full of shadows without a substance."

Such a reader will be wrong. The playwright belonged to no "school," however much or little he may have owed to Yeats, leader of the Irish movement. He had no literary parents; has he any literary heirs? His readers, at least, are his beneficiaries; and when he died, two years ago, after thirty-eight years of

JOHN M. SYNGE.

study of books and men, he left behind him a few printed volumes containing the most vigorous recent contribution to Irish English, verbally and dramatically. Synge has a large name (if we pronounce it correctly, riming it with *bring*), and we are grateful to the American publisher who aims to naturalize him. As only one of his plays has now made its appearance in the Boston edition, it must be enough to examine that one volume. This is called *The Tinker's Wedding*,[1] and tells in two acts of disreputable gypsy folk who try to get formally married, contrary to all precedents of tinkerdom, but who end by having no wedding at all, and doing up the priest (who is about as disreputable as themselves) in a gunny sack—a piece of con-

[1] The Tinker's Wedding: *A comedy in two acts by J. M. Synge.* Boston: J. W. Luce & Co. 75 cents.

duct of which even Synge cannot altogether have approved. No wonder this daring Irishman's theater provoked hostile demonstrations in Dublin! Yet it was not *The Tinker's Wedding*—which is not, when all is said, the best of his plays—that provoked the most violent disturbance. That distinction was reserved for the "Playboy of the Western World," a later, longer and more lasting piece of comedy and satire. The hubbub which the "Playboy" stirred up was an Irish foretaste of what the "Camelots of the King" did for Bernstein's recent drama at the Théâtre Français. The French play was finally taken off; we doubt, too, whether it deserves to be mentioned in one breath with the other. At any rate, Synge's "Playboy" was destined to win applause at the end. The players of the Abbey Theater and their loyal managers stuck it thru, and the Dublin public ended by appreciating the playwright's standpoint in writing:

"I do not think that these country people, who have so much humor themselves, will mind being laughed at without malice, as the people in every other country have been laughed at in their own comedies."

The Tinker's Wedding has less of poetry in it than the "Playboy," and less poetry than any of the dramas of this master of stinging and idealistic prose. It has at least all the vigor which belonged to its author's style and imagination. It has been presented in Dublin and in London; perhaps we shall see it ourselves in the autumn if the Abbey players, who alone have been its interpreters, make the tour of which rumors already fly. And if they do bring it to us, even those who do not read plays, in the hope of finding something less futile than the offerings of our stage, will discover how fiery is the language which these peasants use; how permeated their speech with natural poetry and unhackneyed imagery. "In a good play," writes Synge, "every speech should be as fully flavored as a nut or apple, and such speeches cannot be written by any one who works among people who have shut their eyes on poetry."

It is the distinction of this man's work that after one has listened to the speech of his peasants—an idealization of the speech of workaday peasants—the salt of other modern dramatists has lost its savor for us, and their speech seems flat and servile and laborious.

Women's Wrongs and Rights

If the eighteenth century discovered the rights of man, the nineteenth the rights of women, and the twentieth is feeling its way toward the discovery of the rights of the child, there would seem to be little more to be done, except the application of these principles to modern society. The process of application, however, is sometimes slower than that of discovery, and men have not all of their rights after two centuries, women a limited number of theirs, and children very few of the rights we are beginning dimly to discern as their due. The rights of women have called forth several books of varying importance and value. Mrs. Gilman, in *The Man-Made World*,[1] discusses "our androcentric culture" in her customary gynecocentric fashion. Her theory that the female is the race type and the male but a sex type, has the authority of Lester F. Ward. In some mysterious way the drone of the hive became its head and Mrs. Gilman shows that "for a considerable historic period man became woman's master," and wrought much evil thereby. Characteristically, Mrs. Gilman reverts to the lower animals for her most striking illustrations and arguments. It is exasperating to have struggled so many centuries to kill out the "ape and tiger" in us, and now to be haled back to the menagerie and the barnyard, by sociologists who minimize our progress with comparisons that sting. But there is good tonic in this bitterness. The world, whether "man-made" or woman-made, is full of imperfections to be righted by all of us, men and women, working together, for the better training and conditioning of the children who are, as Mrs. Gilman very justly points out, our most important business. *The Man-Made World* is witty and sensible in many of its contentions, altho there is a hardness and bareness of style due to the fact that the author is a wit and not a humorist.

Another indication of woman's dis-

[1] The Man-Made World. *By Charlotte Perkins Gilman.* New York: Charlton Company. $1.

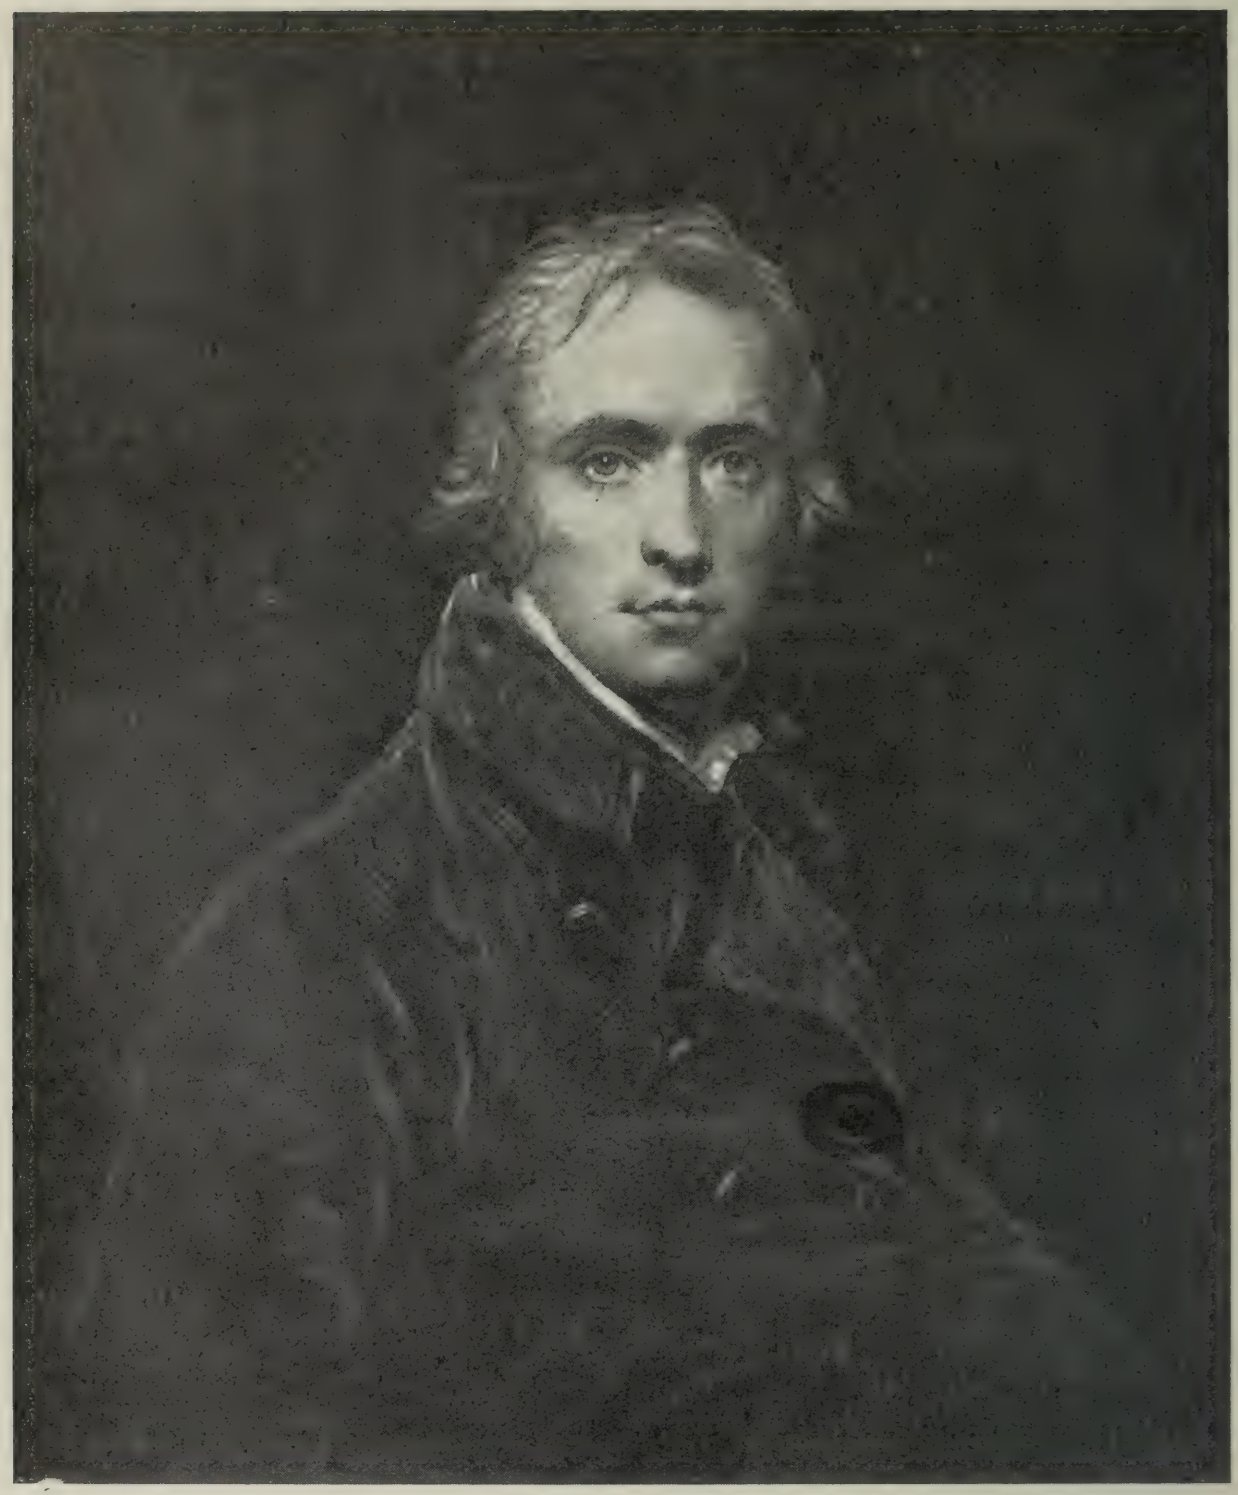
satisfaction with her present anomalous status, neither citizen nor subject, is the remarkable growth of women's clubs. The "eight million women," of Mrs. Dorr's book[2] are the members of the International Council of Women, eight hundred thousand of them being American women, members of the General Federation of Women's Clubs. It is just a coincidence that there are, probably, by a conservative estimate, eight million women who are wage earners in America today. They need the protection of better laws, safer social conditions, and suffrage, according to the author. What the eight million club women want the other eight million workingwomen need, and it is most encouraging that women of leisure and culture, even the self-culture of clubs, are beginning to take an ardent interest in social and civic service. In the course of its twenty years of existence the International Council has agreed to support four movements: "Peace and arbitration, social purity, removing legal disabilities of women, woman suffrage." The last object is still in question among many American women, but the more intelligently they strive for the other reforms the more will they find the vote an efficient help in establishing the better state of which they dream and for which many are whole-heartedly working. Mrs. Dorr's book is fully illustrated. We note an error on page 301, where Mrs. *John* Dewey is called Mrs. Melvil Dewey.

Professor Hecker[3] treats *Women's Rights* broadly, from the historical side. He traces the status of woman from the days of Augustus to the present time, and his exceptional familiarity with Roman law makes his earlier chapters extremely valuable, as the facts are not easily accessible to the general reader. The history of women's rights in England and the United States is to be found in part in the extended volumes by Mrs. Ida H. Harper and Miss Susan B. Anthony: the "History of Woman Suffrage," but this briefer and more extensive survey will be welcome. The tabulation of the laws relating to women in the several States is subject to revision, as the laws are constantly changing, and usually for the better protection of women and children.

The woman movement in Germany has taken a different direction than in America. It has social rather than political aims. More is heard of the "right to motherhood" than of the "right to vote." The literary exponent of the movement is a Swedish woman, Ellen Key, who now, in her sixty-second year, is becoming known in the United States. "The Century of the Child," translated about two years ago, met with a more favorable reception here than is likely to be accorded to the book just appearing, *Love and Marriage*,[4] a translation of the first two volumes of her most important work, "Lifslinjer" ("Lines of Life"), published in 1903. We recognize fully her high ideals and good intentions, but the doctrine she advocates seems to us likely to do more harm than good, at least in this country, where the deviations from monogamy are not so frequent and flagrant as she finds them in Sweden and Germany. Here the social, educational and financial requirements for marriage have not yet risen so high that our young people are driven to a choice between prostitution and free love. But the impediments in the way of marriage and parenthood are becoming greater year by year among the responsible classes, and Ellen Key is quite right in attacking this tendency as injurious to the individual and dangerous to the race. She condemns equally the woman who turns aside from her true vocation to write books or paint pictures, and the wife of fashionable society who lives an idle and parasitic life. For a remedy to the competition between the sexes that results in low wages and the postponement of marriage she looks to Socialism, but she differs from many Socialists in her belief in the private home and in condemning all such substitutes for it as the community crêche. An article by Ellen Key on "The Woman of the Future" may be found in THE INDEPENDENT of October 31, 1907, Vol. LXII, p. 1043.

[2] WHAT EIGHT MILLION WOMEN WANT. *By Rheta Childe Dorr.* Boston: Small, Maynard & Co. $2.

[3] A SHORT HISTORY OF WOMEN'S RIGHTS. *By Eugene A. Hecker.* New York: G. P. Putnam's Sons. $1.50.



[4] LOVE AND MARRIAGE. *By Ellen Key.* With an Introduction by Havelock Ellis. New York: G. P. Putnam's Sons. $1.50.

Sir Randal Cremer. His Life and Work. By Howard Evans. Boston: Ginn & Co. $1.40.

Sir Randal Cremer and Howard Evans were closely associated in London political movements from the organization of the Reform League in 1865 until Cremer's death in 1908. In the later seventies Howard Evans was editor of the *Laborers' Chronicle,* the organ of the Agricultural Laborers' Union that was founded by Joseph Arch, and more recently he was editor of the now defunct *Echo,* which at one time was the foremost organ of Radicalism in the London daily press. It would have been impossible for Cremer to have found a better or more sympathetic biographer; for Howard Evans was nearly as prominent as Cremer in the peace movement and in the various political organizations with which at one time or another Cremer was connected. Friendship and full sympathy, however, have not stood in the way of a really adequate biography of one of the most remarkable men that the Liberal-Labor movement in England of 1865-1910 brought to the front. People who know of Cremer only that he was a journeyman carpenter who took a successful part in the pioneer work of the Liberal-Labor movement, and that he was the foremost apostle of peace in England, can now from Howard Evans's biography realize just what kind of a man he was. He was a lifelong democrat, who surprised his associates by accepting a knighthood. He was an advocate of peace who quarreled with and estranged himself from such honored labor leaders as Thomas Burt and Robert Applegarth. He owed his election for the Haggerston division of London largely to the women of the constituency; yet he was the most active, most persistent and most brutal opponent of women's suffrage in the House of Commons. For the last years of his life he lived in his office and slept in a cot at the back of a book-case; yet today, except for his work for the peace movement, he is best remembered at Westminster as a zealous member of the Kitchen Committee of the House of Commons. He owed most of the political opportunity that came his way to the fact that he was a trade unionist, and it was as a Labor member that he found his way into Parliament; but when his trade union associated itself with the new Independent Labor movement in politics which was represented by forty-six members in the Parliament of 1906-10, Cremer refused to pay the small annual contribution levied for political purposes and by so doing ended his long connection with trade unionism. All aspects of Cremer's work and character are fully treated in Howard Evans's biography. The book has some value as a contribution toward the history of the Labor movement in English politics; but it has a larger value—almost a world wide value—from the fact that it is practically a history of the peace movement in England and a record of what had been accomplished up to the time of Cremer's death.

Uganda for a Holiday. By Sir Frederick Treves, G. C. V. O., C. B., LL. D. New York: E. P. Dutton & Co. Pp. xi, 233. $2.50.

Sir Frederick Treves went a little further afield than the average tourist when he made his trip to Lake Victoria Nyanza by way of Mombasa and the new Uganda Railway. But it was only as an ordinary, sightseeing tourist, and not as either huntsman or scientist, that Sir Frederick Treves penetrated into the heart of "Darkest Africa." In the course of his journeyings he met with no adventures and suffered no inconveniences beyond the dust and heat which afflict a railway traveler in far more civilized regions than those which lie in the shadow of Pliny's Mountains of the Moon. The chief note of interest in this little volume of travel is the surprising fact that such a humdrum, commonplace, comfortable journey can now be taken thru a region which less than sixty years ago had never been trodden by the foot of a white man, and which, until the building of the railway, it took many months to penetrate. Sir Frederick Treves gives many graphic and interesting pictures of the country thru which he passed, and of the game that he saw from the windows of the train when journeying thru the Southern Game Reserve of British East Africa. His enjoy-

JOHN HOPPNER, R. A.

The portrait of the artist, paint ed by himself, is reproduced here from the monograph published by P. & D. Colnaghi & Co., London. (New York: The Macmillan Co.)

ment of scenery is dependent on its novelty. A thing once seen has no further interest for him, and he found his return trip dead and uninteresting. Lakes, rivers, mountains and valleys passed by without eliciting a glance. "Keen expectations were replaced by languid memories," and there was "nothing now but to get home."

John Hoppner, R. A. By William McKay and W. Roberts. New York: The Macmillan Co. $32.50.

The rich volume in which William McKay and W. Roberts learnedly catalog the work of John Hoppner made its appearance in England on the occasion of the centenary of the painter's death. The book is much more than the usual

catalogue raisonné, just as it is more than the usual critical monograph. The page of 11 by 14½ inches is beautiful in itself, and affords the opportunity to include most satisfactory photogravures of the original paintings. There are more than sixty of these photogravures, which are ravishingly fine examples of the process, and tell one more of the painter's art than a whole library of impressionistic criticism ever did. We have here, in addition, an account of the life and career of this eighteenth century R. A., told in the 33-page introduction. Unusually full and accurate descriptions of the paintings, their subjects, histories, etc., follow, arranged alphabetically.

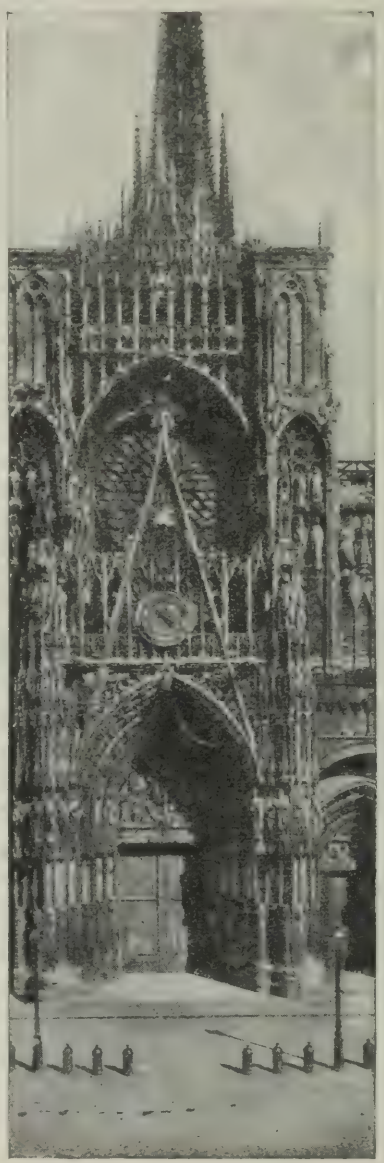
Narratives of Early Maryland, 1633-1684. Edited by Clayton Coleman Hall. (Original Narratives of Early American History, General Editor, J. Franklin Jameson.) New York: Charles Scribner's Son's. $3.

The useful series of "Original Narratives" is continued with this volume on Maryland, under the general supervision of Mr. Jameson and the editorship of Clayton Coleman Hall. The sixteen items here collected cover the palatinate of Lord Baltimore from the first instructions to the original colonists until the controversy with Penn arose in the last quarter of the century. Most of the documents are already well known to specialists, but for more general students they have never been accessible. Like its predecessors, this volume has been supplied with adequate introductions and satisfactory notes.

A Comprehensive History of the Disciples of Christ, Being an Account of a Century's Effort to Restore Primitive Christianity in Its Faith, Doctrine and Life. By William Thomas Moore, LL. D. New York: Fleming H. Revell Company. $3.50.

It is natural that a writer who has spent more than forty years in gathering materials for a history of any movement should incline toward overemphasizing the importance of his subject, and it is to be expected that one who has borne a conspicuous part in the movement would write sometimes with more zeal than critical discernment. These considerations may lead us to discount some of the sweeping assertions and bold comparisons, and to overlook the tendency here and there to magnify trifles in this new history of the Disciples. But when necessary allowance has been made for such inevitable blemishes, it will be found that Dr. Moore has produced a book of no little value, showing as it does the real importance and unusual growth of the Disciples of Christ, and based on the author's familiarity with the details of the development and his intimate knowledge of the men who have been prominent in it.

Romantic Days in Old Boston. By Mary Caroline Crawford. Boston: Little, Brown & Co.



Miss Crawford's old Boston is, after all, not so very old. It belongs to the nineteenth century, and is filled with actors, parsons, agitators and artists whose memory is still green, and whose reminiscences are drawn upon for abundant anecdotes. "I still live," Webster is said to have declared upon his deathbed. Boston still lives, expanding her developing traditions from year to year, and Miss Crawford is anxious to record the fact. She has not done anything so very serious, nor has she tried to, but she has written an entertaining and profitable book for the general reader.

The Life of Friedrich Nietzsche. By Daniel Halevy. Translated by J. M. Hone New York: The Macmillan Co. $2.50.

This is the best life of Nietzsche in English. It is less of a criticism of his philosophy and its influence on contemporary thought than Mencken's life of Nietzsche, but is devoted chiefly to his life and letters, presenting a new and interesting view of this remarkable personality. The author is sufficiently sympathetic without being sycophantic, and he treats Nietzsche, in our opinion quite rightly, as an artist rather than as a philosopher. He utilizes the new material brought out in the large biography of his sister, Frau Förster-Nietzsche, and in the numerous controversies of recent years in the German periodicals. But the author writes smoothly and without pedantry, introducing the quotations from the correspondence without interrupting the narrative. A large part of the volume is devoted to the early friendship and later enmity of Wagner and Nietzsche.

Cathedrals and Cloisters of the Isle de France. (Including Bourges, Troyes, Reims and Rouen.) By Elsie Whitlock Rose. With Illustrations from Original Photographs by Vida Hunt Francis. Two volumes. New York: G. P. Putnam's Sons. $5.

One may find in the newest addition to a familiar series of books on French cathedrals a good deal of information in regard to architecture, a little less history, a pinch of theology and a wealth of illustrations. The author prints also a list of her authorities, for this is distinctly a derivative work, making little claim to originality. The reviewer prefers to such a work as this the authorities cited, or else purely personal and uninstructive travel books; but for those who are frightened by the mere names of the authorities, or who shudder at the thought of reading anything just for the reading's sake, here is a welcome offering. No literary distinction interferes with the direct communication of facts from writer to reader, altho of literary allusion there is a discreet proportion. Some of the halftones possess real charm. And the returned motorist will find in the letterpress an excellent review lesson —not all review.

FROM ROSE'S "CATHEDRALS AND CLOISTERS OF THE ISLE DE FRANCE." (Putnam.)

Introduction to Political Science. By James Wilford Garner. New York: American Book Co. $2.50.

Professor Garner seems to have the happy faculty of presenting the different theories on some very mooted questions in a readable and convincing manner quite unusual for textbooks of this kind. The purpose of this ambitious work is to provide an elementary survey of a wide range of subjects relating to the origin, nature, functions and organization of the state. The author has presented in a clear manner the more important theories of the state and has attempted to analyze and criticise them in the light of the best scientific thought and practice. The result has been a successful setting forth in available form of a very valuable mass of material. The theory of divine origin was nothing "more than the invention of man, designed to bolster up the claims of certain rulers to hold their crowns independently of the will of the people." The compact theory, as advanced by Hobbes, Locke and Rousseau, becomes groundless in the light of our present knowledge of the mind of primitive man, for it presupposes the presence of something he did not have —an already highly developed political consciousness. The patriarchal and matriarchal theories still lack historical proof of universality. The force theory has elements of truth, but the only safe theory is the historical theory, resting upon the doctrine of evolution and regarding political self-consciousness as a very gradual development. Professor Garner states in brief form the arguments pro and con socialism, and reaches the conclusion that the "socialistic theory starts from a false premise when it maintains that private property in land and the instruments of production is not only wrong morally, but also economically." The substitution of collective ownership for private ownership would, he believes, destroy the most powerful mainspring of human endeavor. He evidently mistrusts socialism and is quite frank in taking a conservative attitude. The chapter on "The Electorate" reviews the whole question of suffrage. The discussion of the theories involved leads to a short and clear statement of the opposing views

upon woman suffrage. The movement appears to be gaining rapidly and everything points to woman suffrage in the near future. The book closes with an interesting chapter on "The Judiciary."

Frederick William Maitland, Downing Professor of the Laws of England. By H. A. L. Fisher. New York: G. P. Putnam's Sons. Cambridge University Press, 1910. Pp. ii, 180. $1.65.

It was a misfortune from the point of view of English legal history and literature when Professor Maitland passed away at the early age of fifty-six. For some years previous to his death also, Professor Maitland's health had been broken, and from 1899 he had passed much of his time in the Canary Islands, where he died in 1906. Yet with all the drawbacks of ill health and early death, Professor Maitland made an inestimable contribution to English history and to the understanding of English law. He was a learned historian and a learned lawyer, and he demonstrated in his "History of English Law," written in collaboration with Sir Frederick Pollock but chiefly the work of Maitland, and in his transcripts and commentaries on the old English Year Books, that history and law were inseparable, that the old law records served as material for the great enrichment of social, economic and political history; and that it was hopeless to endeavor to understand the principles of English law without a knowledge of their historical basis. His writings are eminently readable, and in the words of an appreciation which appeared in the Cambridge University Reporter not long after his death, Professor Maitland "could and did demonstrate that extraordinary learning and research have no connection whatever with dullness and pedantry, and that learning may be combined with the most philosophic and the profoundest views of law which the mind of man can form." Professor Fisher's little book is a very slight sketch of the life of Professor Maitland; but it is sufficient to show the charm of his character, the depth and constancy of his friendships, and the generosity of his enthusiasms, as well as his profound and philosophic views of law and history.

Literary Notes

.... We have received a booklet containing a poem written by William A. Houghton, whose poetry has appeared in THE INDEPENDENT in recent years. The poem is entitled *The Pond—An Idyl of Boyhood* (Brunswick Publishing Co., Brunswick, Maine). It is written in a pleasing style, with evidence of a clear and kindly memory of boyhood.

....Frederick A. Stokes Company announces for spring issue several books that will especially interest the suffrage worker and the student of what is rather oddly called "Feminism." Olive Schreiner is the writer of *Woman and Labor*, and Marguerite Stephens signs *Woman and Marriage*. A new edition of John Stuart Mill's *Subjection of Women* appears, with a foreword by Carrie Chapman Catt.

....The first sale of the Robert Hoe Library will begin on Monday, April 24th, and will no doubt constitute, as the London *Times* has said, "The greatest event of its kind in the annals of book auctions." The library is now on exhibition at the new building of the Anderson Art Galleries, Madison avenue and Fortieth street. It includes the four folio Shakespeares, a unique copy of "Helyas, Knight of the Swanne," on vellum, 1512; the Gutenberg Bible on vellum, 1450-55; the "Lactantius" of Sweynheim and Pannartz 1465; Augustinus's "De Civitate Dei" of John and Wendelin of Speier, 1470; Malory's "Morte d'Arthur," printed by Caxton in 1485; Wynken de Worde's "De Proprietatibus Rerum," 1495, and numerous other rarities in early printed books and manuscripts. American libraries and collectors have never before had such an opportunity for such purchase, nor will they have such again.

....The number of nature studies and books in praise of out-of-doors published nowadays is indeed formidable. The Outing Publishing Company have an interesting list, including *How to Live in the Country*, by E. P. Powell, a writer with whom the readers of THE INDEPENDENT are exceedingly well acquainted. On the Houghton Mifflin list appears a new volume of essays by Dallas Lore Sharp, *The Face of the Fields*. One of the essays is entitled "The Nature Writer." "We shy at the word nature," writes Mr. Sharp; "good honest term, it has suffered a sea change with us; it has become literary." Again, he observes:

"The nature-writer deserves, maybe, his dubious reputation; he is more or less of a fraud, perhaps. And perhaps everybody else is, more or less. I am sure of it as regards preachers and plumbers and politicians and men who work by the day. Yet I have known a few honest men of each of these several sorts, although I can't recall just now the honest plumber. I have known honest nature-writers, too."

....One business romance, *The Making of a Fortune,* differs from most of its rivals in that it is well written. It is also an absorbing tale, and short enough to be enjoyed at one sitting. (*The Making of a Fortune,* by Harriet Prescott Spofford. Harpers; $1.)

Notes on the Books of the Season

Does Fiction yield ground to Memoirs? As we ask the question, our office book shelves groan under the new vintage—or mintage—of novels. But every day brings, also, more and more biographies and "recollections" and translations from the French. The lure of the "life" is, in the adjective of the red-blood artists, "compelling."

THE NOVELS.

Yet there is no "crisis" of the novel, to make use of a French idiom. We are promised both quantity and quality. We are promised, for example, a new Owen Wister novel, as good or better than *The Virginian.* The title is *Members of the Family.* Mr. Wister's publishers, the Macmillan Co., have just issued a volume of short stories by the late F. Marion Crawford, appropriately entitled *Wandering Ghosts.* From first to last Crawford was a born story teller. Maurice Hewlett's new novel is entitled *Brazenhead the Great* (Scribner). Quiller Couch is a knight nowadays, and his latest is *Brother Copas*—another Scribner publication. We are reminded of a loss which is really personal in the death of Myra Kelly by the announcement of *Her Little Young Ladyship* (Scribner). Little-Brown publishes Marriott Watson's *Alise of Astra,* a romance of European travel. The Century Company publish Dr. Weir Mitchell's *John Sherwood, Ironmaster.* Putnam has *Later Pratt Portraits,* by Anna Fuller, a delightful volume of New England studies; *The Ashes of a God,* by F. W. Bain, and *The Return,* by Walter de la Mere. The posthumous novel of David Graham Phillips, *The Grain of Dust,* will bear the Appleton imprint; also a new Chambers novel, *The Adventures of a Modest Man,* Joseph C. Lincoln's *Woman Hater,* H. K. Webster's *Girl in the Other Seat,* and Rafael Sabatini's *Lion Skin.* Jules Claretie, of the Académie Française, is more than theater director and feuilletoniste of the *Temps;* he, too, is a novelist, and his *Which Is My Husband?* in its English form is offered by the Appletons. Dutton's list has Mrs. Henry de la Pasture's *Master Christopher,* and two Marjorie Bowen romances—*I Will Maintain* and *Defender of the Faith.* Robert W. Service of Alaska with the *Trail of the Ninety-eight* and Gouverneur Morris with *Yellow Men and Gold,* are only two of the authors who make the present season of Dodd, Mead & Co. notable in fiction. Duffield & Co. have a clever writer in Helen Mackay, whose *Half Loaves* is a story of cosmopolitan life. Eden Phillpotts is one of the English novelists whose work must be followed by those who would know all that is good in contemporary novel writing; his *Demeter's Daughter* will appear this spring (Lane). So will Mrs. John Lane's *Talk o' the Town* and a translation of Marcelle Tinayre's *Shadow of Love.* Marcelle Tinayre is one of the most respectable of living French novelists. Cassell & Co. are responsible for the translation of another Frenchwoman's product—*The Unknown Isle,* by her who signs herself Pierre de Coulevain. The automobile in fiction has not yet quite given place to the aeroplane, as Lawrence Perry's *Prince or Chauffeur* bears clever testimony (A. C. McClurg & Co.). *The Love Story of an Airman in the Alps* is, however, signed by Max Pemberton (Sturgis & Walton Company). *The Prodigal Judge,* by Vaughan Kester (Bobbs-Merrill Company), is one of the most prominent of the new novels. Ellen Glascow's *Miller of Old Church* and new novels by the Castles and the Williamsons appear in the Doubleday, Page list. Mitchell Kennerley seems to have annexed Upton Sinclair; he publishes, in any case, his *Love's Pilgrimage.* Leonard Merrick is an exceedingly clever Englishman of letters little known in America, tho praised by Mr. Howells; his *Conrad in Quest of His Youth* has just been published by the same Kennerley. Canadian lumber camps give Ridgewell Cullum the material for his *Trail of the Axe* (George W. Jacobs). Of the juveniles, George Cary Eggleston's are ever among the best. Lothrop, Lee & Shepard Co. announce his story of a Carolina cruise: *What Happened at Quasi.* They also issue Edward Stratemeyer's *Dave Porter and His Rivals,* and Warren L. Eldred's *Camp St. Dunstan.*

AMERICAN MEMOIRS.

There is certainly no shortage of memoirs this year. Of Americans, let us note the *John La Farge* of Royal Cortissoz, of the New York *Tribune* (Houghton Mifflin & Co.), and the *Harriet Beecher Stowe* of Charles E. and Lyman Beecher Stowe, from the same Boston publishers. Other volumes which should, perhaps, be classified here are George W. Smalley's *Anglo-American Memoirs* (Putnam) and *The War Maker,* the story of Captain George Boynton, by Horace Smith (McClurg). Doubleday, Page & Co. promise an elaborate biography of Andrew Jackson by J. S. Bassett, and the *Life and Letters* of Moses Coit Tyler, by Jessica Tyler Smith. From the same publisher will come Booker T. Washington's *Chapters from My Experience* and Daniel Frohman's *Memoirs of a Manager.* Does not *The Real Captain Kidd* belong to this list of American biographies, in any case? We think so; and it is the work of Sir Cornelius Neale Dalton (Duffield). In the American Crisis Biographies appears a biography of William Lloyd Garrison by Lindsay Swift (Jacobs).

FOREIGN BIOGRAPHY.

There are so many volumes of non-American memoirs that we can hardly undertake to comment upon them:

Martin Luther, by Preserved Smith (Houghton Mifflin); *Wagner at Home,* by Judith Gautier, daughter of Théo (Lane); *The Mother*

of Goethe, Frau Aga, by Margaret Reeks (Lane); *From Memory's Shrine,* the reminiscences of Carmen Sylva (Lippincott). MEMOIRS OF ENGLISHMEN: *John Bright,* by R. Barry O'Brien (Houghton Mifflin); *Benjamin Disraeli,* Volume II, by W. F. Monypenny (Macmillan); *An Autobiography, 1835-1911,* by Alfred Austin (Macmillan); *Noble Dames and Notable Men of the Georgian Era,* by John Fyvie (Lane); *The Lighter Side of My Official Life,* by Sir Robert Anderson (Doran); *Oliver Goldsmith,* by Frank Frankfort Moore (Dutton); *Charles Dickens,* by Miss Dickens (Cassell); *Mrs. Gaskell,* by Ellis H. Chadwick (Stokes). FRENCH MEMOIRS: *Rachel: Her Stage Life,* by Francis Gribble (Scribner); *Henry II: His Court and His Times,* by H. Noel Williams (Scribner); *Louis XIV and Madame de Maintenon,* by Lady Blennerhasset (Scribner); *Napoleon and King Murat: 1808-1815,* by Albert Espitalier (Lane); *Talleyrand, the Man,* by Bernard de Lacombe (Dana, Estes).

AMERICAN HISTORY.

To begin with the history of ourselves. Here one finds *The Origin and Growth of the American Constitution,* by Hannis Taylor, *France in the American Revolution,* by James Breck Perkins, and *California Under Spain and Mexico,* by Irving B. Richman (Houghton Mifflin); *Letters of Richard Henry Lee,* edited by James C. Ballagh, Volume I (Macmillan); *Essays in American History, Dedicated to Frederick Jackson Turner* (Holt); *Short History of the United States Navy,* by Captain George R. Clark and others (Lippincott); *Gettysburg, the Pivotal Battle of the Civil War,* by R. K. Beecham (McClurg); *Records of the Federal Convention of 1787,* edited by Max Farrand (Yale University Press); and, in the Original Narratives of Early American History, *Narratives of Early Carolina,* edited by A. S. Smalley, Jr. (Scribner).

GENERAL HISTORY.

Of non-American history announced for early publication one volume which promises to interest us in Frank W. Hackett's *Reminiscences of the Geneva Tribunal of Arbitration, 1872* (Houghton Mifflin). The Oxford University Press has, as always, an important offering: *Federations and Unions Within the British Empire,* by H. E. Egerton; *Ireland and the Normans,* by G. H. Orpen; *Documents of the Continental Reformation,* by B. J. Kidd; *The English Factories in England, 1634-6,* by W. Foster. In *Historical Geography of the British Colonies,* by Sir C. P. Lucas, "Canada" and "Newfoundland" make up Parts III and IV of Volume V. An important work on *Labrador, Its Discovery, Exploration and Development,* by W. N. Gosling, has already reached us from the John Lane Company.

TRAVEL BOOKS.

Of travel there is nowadays no end, and it is impossible to note all the good things in store for him who takes his travels in an armchair or who, actually traveling, reads about the places he is in. A little volume which promises to be useful is Henry James Forman's *The Ideal Italian Tour* (Houghton Mifflin). *Little Cities of Italy,* by André Maurel, comes to us in translation from Putnam. *Seeing Europe by Automobile* is Lee Meriwether's contribution (Baker-Taylor). If we turn from the kind of travels which all of us take to those which are so extraordinary as to arrest attention, we shall be sure to take interest in *My Balkan Tour,* by Roy Trevor; in *The Diary of a Soldier of Fortune,* by Stanley Portal Hyatt, and in *Himalayan Byways,* by E. P. Stebbing (Lane); also in *The Capitals of China,* by William Edgar Geil, and *Gleanings from Fifty Years in China,* by Archibald Little (Lippincott). David Moore Lindsay is the author of *A Voyage to the Arctic in the Whaler "Aurora"* (Dana Estes). But nothing seems more desirable to us than the publication in English of books about South America. Up to the present time it has been necessary for one to look to books in French and Spanish if he would satisfy his curiosity about the continent which lies to our south. Hiram Bingham's *Across South America* is promised by Houghton Mifflin; *Argentina, Past and Present,* by W. H. Koebel, by Dodd, Mead. In Scribner's South American Series appears a volume on *Brazil,* by Pierre Dennis, translated by Bernard Miall. From L. C. Page will come Nevin O. Winter's *Argentina and the People of Today* as well as Markell and Gregory's *Old Country Inns of England* in a more familiar field.

THE KING'S ARMS, HEMEL HEMPSTEAD.
From Maskell and Gregory's "Old Country Inns of England" (Page).

BELLES LETTRES.

In belles lettres, the new edition of the Stevenson correspondence, containing more than one hundred new letters, is announced by the

Scribners, in four volumes. Robert Louis is the subject also of a new volume in Cassell's series of *Little Books About Great Writers*. *Letters of Edward Lear*, edited by Lady Strachey, reach their second series (Duffield). An anthology of *Letters that Live*, edited by Laura E. Lockwood and Amy R. Kelly, is added by Holt. In the field of essays, Mr. Chesterton's *Alarms and Discursions* and *Appreciations and Criticisms of the Works of Charles Dickens*, published respectively by Dodd, Mead and by Dutton, came to us from over the water. Frank Harris writes of *The Women of Shakespeare* (Kennerley). The indefatigable A. C. Benson is the biographer this time of *John Ruskin, Art Critic and Social Reformer* (Putnam). There would seem to be plenty of material for Edward Thomas's *Feminine Influence on the Poets* (Lane). A good book to read with this last should be Jefferson B. Fletcher's *Religion of Beauty in Women, and Other Essays of Platonic Love in Poetry and Society* (Macmillan).

ECONOMICS.

The following are some of the more important new books in the field of economics and civics: *The Income Tax: A Study of the History, the Theory and the Practice of Income Taxation at Home and Abroad*, by Edwin R. A. Seligman; *Principles of Economics*, by F. W. Taussig, 2 vols., and *Commission Government*, by Ernest S. Bradford (Macmillan); *The Standard of Living Among the Industrial People of America*, by Frank H. Streightoff (Houghton Mifflin); *Greek Immigration to the United States*, by Henry Pratt Fairchild (Yale University Press); *Industrial Depressions*, by George H. Hull, and *Women and Labor*, by Olive Schreiner (Stokes); *The Woman Movement in America*, by Belle Squire (McClurg); *Land Problems and National Welfare*, by Christopher Turner (Lane); *The Transition to an Objective Standard of Social Control*, by Luther Lee Bernard (University of Chicago Press); *Legal Doctrine and Social Progress*, by Frank Parsons (Huebsch); *The Girl That Disappears*, an account of the "white slave" traffic, by Gen. Theodore A. Bingham (Badger).

THE PHILOSOPHERS.

We now have in English all the important works of Henri Bergson, the most popular of modern French philosophers, *Creative Evolution* (Holt), *Time and Free Will* (Macmillan) and *Matter and Memory* (Macmillan). The Open Court Publishing Company announces the same author's *Intracellular Pangenesis*. H. M. Bernard's *Some Neglected Factors in Evolution* (Putnam), *Breeding and the Mendelian Discovery*, by A. D. Darbyshire (Cassell) and *Convergence in Evolution* (Dutton) are books to be associated here. Macmillan issues *The Mediæval Mind*, by Henry Osborn Taylor (2 volumes), and *Animal Intelligence*, a work based upon experiments, by Edward L. Thorndyke. Dr. Paul Carus's *Truth on Trial* is an exposition of the Nature of Truth, preceded by a critique of Pragmatism; this and his *Personality* are published by the Open Court.

Pebbles

THEM that's down
Is down because
That best accords
With nature's laws.
AND
Them that's up
Is up because
That best accords
With nature's laws.
SO
It ain't for us
To kick and wonder
Why some's on top
And some is under.
—*W. J. Lampton.*

HE—Do you like classical music?

She—That depends on whether you want my honest opinion, or are thinking of inviting me to a symphony concert.—*Boston Transcript.*

AN insane woman has won a prize for a magazine poem. That throws light on a hitherto unanswered question.—*Cleveland Leader.*

FIRST MAGNATE.—This problem of taking care of the poor is a hard one.

Second Magnate.—Most difficult. It's easy enough to get money from them, but it ruins them to give it back.—*Life.*

MRS. CALLER—I believe in making a servant keep her place.

Mrs. Hiram Daly—So do I; but, dear me, I can't make one keep her place more than a week.—*Boston Transcript.*

DAVID BISPHAM was undergoing the ministrations of the ship's barber.

"I 'opes," said the barber, "that we shall 'ave the pleasure of 'earin' you at the concert tonight."

"No," explained the famous singer, "I've had a long and exhausting season in America and within a few days I am to open in London. I have decided not to do anything on this voyage."

"It's the same way with me," said the barber, understandingly. "When I'm hashore I never looks at a razor."—*Success.*

When Smetana's opera "The Bartered Bride" was first put on at the Metropolitan somebody called the opera house on the telephone and asked if the box office man wouldn't please keep some seats for "The Bartender's Bride." The other day, soon after "Königskinder" with Miss Farrar as the Goose Girl had its first performance, which took place when "The Girl of the Golden West" was still pretty much in the minds of operagoers, a young man's voice came over the telephone much as follows:

"Say, is this the Metropolitan?"

He was assured that it was.

"I want some tickets."

"What for?"

"Well, boss, I ain't sure, but I think she said 'The Girl of the Golden Goose.'"—*New York Sun.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Session of Congress

FOR the special session which was called only for action upon the reciprocity agreement with Canada the Democrats of the House have marked out a program that may keep Congress in session until September. Fortunately, it may now be expected that a vote upon reciprocity will precede the attempted revision of tariff schedules. Some Democrats feared that if the reciprocity bill should be passed first, and if thereafter the House and the Senate should disagree about the date of adjournment, the President would end the session by executive order. It is now reported upon what seems to be good authority that he has promised to refrain from any such use of his power. And so there is left no excuse for failure to act promptly upon the important agreement which Congress is asked to approve. Democrats who would like to play politics thruout the session are unwilling to make effective by their votes this achievement of a Republican Administration. Speaker Clark even "forgot" in his speech on the opening day to say a word about it, altho he pointed out that there must be downward revision of the tariff. But the party, by its action at the last session, is committed to the support of the agreement, and it would be a political blunder for the House majority to withhold now the approval which was given then.

It is clearly the duty of the House Democratic majority to take a straight course, and to send its completed measures to the Senate in the order which a due regard for propriety and their safety requires. The reciprocity bill, tariff revision bills, and other projects of legislation named in the House program will be imperiled in the Senate, but the failure there of any measure supported by public opinion will be ascribed, as a rule, to the Republican party, because in the Senate there is a Republican majority.

The division of the Senate's Democratic minority in the contest for the election of a leader was marked by much bitterness. The election of Senator Martin is a victory for the conservative element, and for those who were willing to stand with the Aldrich Republican regulars on many occasions during the tariff debate of 1909. Mr. Martin himself voted against the demands of the Democratic platform with respect to the free list. Several of those who were counted for him are inclined to make revenue requirements a cloak for protection to products in which they and their constituents are interested. Because of their attitude, and of the effect of local influence upon the tariff policy of the insurgent Republicans, the fate of any House tariff bill in the Senate cannot be foreseen. There is ground for apprehension that the complication of tariff policies there will endanger the Canadian reciprocity bill. This bill should be sent from the House to the Senate at an early date and in its original form. After its fate has been decided, the ground will be cleared for consideration of House revision bills.

The Democratic program is too long. There should be action concerning the resolution for the direct election of Senators. Fresh evidence in support of this reform is furnished by the long contest at Albany and the Lorimer case. Reapportionment should not be deferred. But there should be no partisan investigation of the executive

departments now. The search for campaign material, if it must be made, should be postponed until the regular session. We are not convinced that the revision of any tariff schedule ought to be undertaken at this special session.

It will be admitted by impartial critics, we think, that the Democrats, gaining control of the House for the first time in sixteen years, have made a fair beginning. But their Speaker blundered when in his elaborate address he completely ignored the subject for the consideration of which he and his associates had been called back to Washington; and in forming the new committees too much prominence and power have been given to members from the Southern States. This is seen when a list of the chairmen is inspected. It is true that, as the South has been continuously Democratic, its Representatives have quite naturally risen, by the rule of seniority, to places of the highest rank in the minority groups of nearly all the committees, and that for this reason these members were the foremost candidates for chairmanships when control of the House was shifted to their party. Still, the makers of the new committees should have declined to give more than four-fifths of the chairmanships to the South.

The Jubilee of Faith

With a certainty which we call science we know that the sun will move up and still up along its ecliptic, and bring the tulips and hyacinths to the garden border, and the dearer columbines and anemones in the edges of the forest, for is not astronomy the surest of the sciences? True, but even so our certainty is but the assurance of faith. We know not what catastrophe in the heavens may do for our solar system that which has been done for the stars in the sky which have burst out into sudden new splendor. Yet we fear not for the resurrection of spring.

Nor do we fear for the resurrection of the spirit after the winter of death. It has no mathematical proof, but it seems sure, and we believe it. We attach our faith, which had covered the Jewish and pagan world, with the resurrection of Jesus from the tomb; and since that memorable Easter morning many thousands in all lands have believed they have seen and have talked with the spirits of their departed. So easy is it to believe, so hard not to believe, in the Resurrection of the Dead.

A writer, lately passed beyond, with the memory of three generations behind her, asks in our present issue why the Puritan spirit, as she knew it in her childhood's home in Andover, did not recognize Easter day with special flowers or song or praise. Those Puritans were magnificent men and women—none better and truer have ever lived. Very far be it from us to join in any sneer at them such as Macaulay exprest when he said that the Puritans hated bear-baiting, not because it gave pain to the bear, but because it gave pleasure to the spectators. But they were both logical and thrifty people. Why celebrate Christmas as a day when our Lord was not born? Why honor Easter Sunday when every Sunday of the year celebrates the resurrection? And if Jesus said that neither on the hill of Samaria nor in the temples of Jerusalem was it necessary to worship, for the true worship is in spirit and truth, then why, said they, beautify the church and the day, instead of beautifying the heart.

We choose the easier way. We let flowers and song teach us religion, so that reverence and faith may insensibly and without too much effort of soul spiritualize our life. It is well, beautiful, praiseworthy; but let us remember that the esthetic may be the handmaid of religion, but is no part of religion. The esthetic in music or art, in lilies and roses, may be the handmaid of lust or war as well as of faith. The carnival is the preparation for the solemnities and penitences of Lent, but Mardi Gras is a heathenish festival. We err if we make our religion too much a matter of observance or ritual on holy days. All days are holy. Worship is not formal and visible. We need not banish either beauty or religion, but there is much more danger of becoming formal than puritanic. There is more hypocrisy in formalism than there is in puritanism.

Then let the Easter Sunday dress itself in beauty of flowers and song, but let its heart rest in the hope and faith

and assurance of the resurrection and the eternal life, with Him who is the first fruits of them that sleep; for this day is the jubilee of faith.

The Farce of San Antonio

No farce is funnier than the comedy of San Antonio. No rabbit-track is crookeder than the twistifications of the story of the negro cavalry, orders given and countermanded; to be removed, to remain. It would be a sight for an artist to represent in line or color the amusement President Taft has had out of it, or the brave charge, turned into consternation, of Congressman Garner on the negro Ninth Cavalry. This is not the Garner who lives with apes in Africa, but another Garner who fusses with Africans in Texas. His is the district where the Brownsville trouble occurred with certain other negro soldiers.

Among the soldiers sent to Texas to patrol and guard the Texas boundary was this fine regiment of negro cavalry. They were quartered at San Antonio. Congressman Garner brought to the President terrible stories of resistance of the negro soldiers to the Jim Crow separation in the street cars, of conductors beaten and the danger of riot, and begged the President to remove them. But San Antonio is not in Congressman Garner's district; it is in Congressman Slayden's district. The President smiled, consented, and gave orders to send the regiment on patrol duty, scattered along a dozen towns near the border. But this is Mr. Garner's district. He had not thought of that. A company would be quartered at Brownsville, yes, at Brownsville! The telegraph carried the news to Mr. Garner's district, and he got the returns quick. He was flooded with telegrams asking why he had got the negro cavalrymen sent to their towns, and requiring him to have the order countermanded. Meanwhile, strange to say, the business men in San Antonio wired to Congressman Slayden that they did not want the soldiers removed; they were well behaved, under good discipline, and might stay—and this with Brownsville not forgotten! So Mr. Slayden metaphorically tweaked some inches of Mr. Garner's ears; and either Congressman was eager to get to the President first, one to beg Mr. Taft not to send the negroes to his district, and the other to beg him to let the negroes stay in his; and he, Slayden, the man who had blamed the President for sending the soldiers to Texas. With a twinkle of fine humor the President agreed with both, and the soldiers stay in San Antonio where they are wanted, and will not go to visit Congressman Garner's constituents where they were not wanted. The burlesque is over, and the President is still smiling his expansive smile; the soldiers are laughing, Congressman Slayden is content, and Congressman Garner is wondering how he happened to make a monkey of himself.

Now that the farce is ended, and the players have retired, let us say a more serious word. San Antonio is not to be another Brownsville. We trust the race journals will not get excited over the readiness of the President on the first complaint to move the soldiers away. He did right, and he did it in a most happy way. He ordered them sent into the complainant's very territory, even to Brownsville. Whether negro soldiers in the old affair shot up Brownsville we do not know, nor do we care much; they had the provocation. And these black soldiers at San Antonio had provocation. They were told that they, soldiers, and good soldiers, of the United States, wearing its uniform, were not fit to sit in the same seats in a public conveyance as other people, and they were thrust into a place by themselves, and yet they behaved themselves with more Christian meekness than soldierly resentment, and are credited with general good conduct. The law is unjust and bad, but they submitted to it. Texas is not yet a wholly civilized State; it still enacts some barbarous laws. But in Rome we must do as the Romans do; and in Dahomey we must not resent the tribal customs by acts of violence. Violence in Dahomey under such conditions would give white men a bad name; and here negroes may express their minds with courteous freedom, but should yield quietly, if contemptuously or sarcastically, to laws that discriminate against them. That is the prudent way, and the Christian way. Of all men negro soldiers should be very

careful not to give offense by illegal violence. They especially have the honor of their race in their keeping. If they are brave in danger, amenable to discipline, and as peaceable as they are courageous, they fill their duty and do honor for all of their color.

Minimum Wage by Law

It will be interesting to see what happens to Assembly Bill 799 and Senate Bill 317 in Wisconsin. If they arrive at the dignity of statute law it will be interesting to see what further happens to their provisions in the Supreme Court of Wisconsin, and perhaps, subsequently, in the Supreme Court of the United States.

These bills undertake to define for administrative purposes and judicial proceedings such terms as "oppressive employment," "living wage" and "employment property." They would make it unlawful for any employer using physical property for the production and sale for profit of products of labor hired for wages to employ labor in an "oppressive employment" unless he should first have obtained a license; and they would penalize any employer who should fail or neglect to pay to every employee in each "oppressive employment" at least a "living wage."

In substance the proposed act is, of course, a minimum wage act, and the bills under consideration have been drawn with care and technical detail to meet constitutional restrictions against discrimination and the taking of property without due process of law, and to establish definite standards without leaving discretion to administrative boards.

To a large proportion of American voters such legislation will seem socialistic or paternalistic to an absurd and dangerous limit. The objectors will not be found only in the ranks of the larger employers of labor. Conservatism in these matters is deeper and more obstinate in the minds of farmers, shopkeepers, grocers, butchers, bakers, schoolmasters, ministers, doctors and lawyers than it is among the great corporation directors. It is rooted in the notion, which was once a true account of the facts, that this is a land in which every man who is good for anything has his chance, and that it should be our patriotic care to maintain a government of the non-paternalistic type, interfering as little as possible with private initiative and management.

But this notion is not a true account of the facts now, and the ignorance of our great middle class of small property owners of the actual industrial conditions in this and other countries seriously threatens to send America to the rear among progressive civilized nations. There is hardly a phase of the complicated relations arising in a highly organized industrial society, to which employers, employees and the police power of the State are parties, that is not more intelligently dealt with in England, Germany, France, Belgium, Australasia and South Africa than in the United States. This statement can be defended without going so far as to say whether or not the legislation of other lands is wise. That legislation is the product of exhaustive study and detailed report. Other peoples have taken action after informing themselves upon the facts. Americans refuse to take action, in a stolid, all-comprehensive ignorance of the facts.

And one fact is that for fifteen years Australia has successfully administered a minimum wages law, and by means of it has prevented the sinking of white labor to the Chinese standard of living, which, in 1896, was so seriously threatened that the public stood ready to adopt any policy promising results. The experiment is, therefore, not visionary, not academic. It has been proven workable by practical people in a practical land. England has followed the Australian example by enacting a minimum wage law that went into effect in January, 1910.

As our readers well know, we believe that substantial social progress is made, not as a rule thru revolutionary substitutions of one "social order" for another. It is made by outlawing and eliminating one specific kind of barbarism after another, and raising little by little the level below which the condition of the most miserable shall not be permitted to fall without protest and penalty.

Slavery has been abolished, and such disgraces as overcrowding and tubercular tenement houses will be. We must

go on to abolish the legal right of capitalism to maintain "oppressive employment." The old economic argument that wages tend to be as high as existent industrial causes can make them was never anything but arrant nonsense, for the simple reason that the public can always choose between paying "living wages" for the production of any given article or service or going without that service or article. If it can't go without it, it will always pay the necessary price to get it, and will go without something else. The time has come when the civilized world must pay living wages to those who produce the necessaries and the substantial comforts of life, even if we have to go without "monkey dinners" and the costlier entrées in our after-theater champagne suppers.

Free Speech Suppresst

In The Independent of February 9 there appeared an article by Enoch M. Banks, of Southern birth and training, Professor of History and Economics in the University of Florida. His subject was "A Semi-Centennial View of Secession." He defended the appearance of an article, whose conclusions were not in agreement with the views which led to the attempt at secession, by saying:

> "The South is becoming more tolerant of a free discussion if its past and present policies . . . and is paving the way for a liberated intellectual life. This new spirit of liberality toward opposing views when exprest with sincerity as befitting decorum is perhaps the greatest incipient triumph of the twentieth century South."

In that article he recognized negro slavery as the occasion for the war and that its defense required adhesion to the doctrine of State sovereignty. As to both State sovereignty and slavery, he admitted that the attitude of the South was a mistaken one.

Was that a conclusion proper to be held by one who is a teacher in a Southern university? Beyond question, yes. It is proper that in a Southern or Northern university both views might be held. So far as one is wrong there will be other teachers to correct it. Were his conclusions such as could with prudence be publicly proclaimed by one holding such a position as teacher? Professor Banks thought so, and took the risk. But he has found that the risk has severed his connection with the University of Florida. He has been compelled to resign.

Professor Banks's article in The Independent came under the notice of a man of some local fame—we believe he had once been a Presidential elector, and he was a fluent political orator—we forget his name; it is not a *nomen præclarum*—but he wrote a letter to us denouncing the professor and his views. We did not think it worth printing and sent a courteous reply. That made him angry. He declared he would expose and denounce Professor Banks and The Independent in every journal in Florida and the South. He kept his word. He waved the tattered, but sacred, flag of the Confederacy, appealed to the pious sentiments of Sons and Daughters, and demanded the removal of the traitorous professor from the chair where he was teaching treason to the youth of Florida. And he did it. The journals published his fulminations. Florida was stirred with worked up passion. The professor's resignation was demanded; there were threats that the legislature would withdraw or reduce its appropriation. Professor Banks saw that his presence was endangering the financial support of the university and he gave in his resignation to the president and it was accepted with regrets. Liberty of speech was denied. The victim was sacrificed.

And yet Professor Banks was not mistaken. The South "is becoming more tolerant of free discussion." There is "a new spirit of liberality toward opposing views." But if somewhat existent it is not prevalent, as he has found to his disappointment. It will not do, at least in the Gulf States, for a man who would keep a position of public service to dare to say that slavery was wrong, that it was time Nationalism should supplant State Sovereignty, and that the war for secession was not the most glorious, altho unsuccessful, struggle of modern times. Not yet is it allowed for a man to express opinions of his own. He must shout with the mass or go.

It is a sad condition of things, but they are improving. The Atlanta *Con-*

stitution actively defended Professor Banks's liberty of speech. We trust he will find a place in some other Southern institution and not be compelled to seek a freer civilization. He is a loyal Southerner. He loves his section as it never occurs to a Northern man to love his section. Ostracised from Florida, he may be welcome in other Southern States; but we should have liked it if the thousands of Northern men who have settled in Florida had flooded the State journals with letters in defense of free speech, and had themselves illustrated it. The press should not be left wholly to the noisy and noisome orators and writers who would glorify, and would, if they could, restore, an old bad past. Professor Banks spoke truly and bravely; we need a multitude of others in the South who will speak their mind and support each other, and fight for freedom now, as fifty years ago their less wise ancestors fought for slavery. The day of victory is coming, and the chance and duty to speak and act for it is urgent. What said John Milton when he defended himself for fighting for a righteous but imperiled cause. He pictured to himself the Church triumphant over her foes, liberty of thought and speech achieved in Church and State, and how would he then feel if he had taken no part in the glad free victory? He would have ever after said to himself:

"Slothful and ever to be set light by, the Church has now overcome her late distresses after the unwearied labors of many of her true servants that stood up in her defense; thou also wouldst take upon thee to share amongst them of their joy: but wherefore thou? Where canst thou show any word or deed of thine which might have hastened her peace? Whatever thou dost now talk, or write, or look, is but the alms of other men's prudence and zeal. Dare not now to say or do anything better than thy former sloth and infancy; or if thou darest, thou dost impudently to make a thrifty purchase of boldness to thyself out of the painful merits of other men; what before was thy sin is now thy duty, to be abject and worthless."

Professor Banks dared to speak; will not many others speak, according to their ability, and hasten the liberty and the better day now sure to come to the South, and save themselves in the future glad day from the shameful memory of cowardly silence?

The Art of Cutting Off a Dog's Tail

Every little while we are reminded of the story of the man who, to save pain to his dog, cut off his tail inch by inch. When we say "reminded," we do not mean that it recurs spontaneously to mind or that we voluntarily recollect it. No. We are, in fact, tired of hearing about it, because it has for over sixty years been the favorite illustration, often the sole argument, of our critical readers. The policy which The Independent has tried to pursue, that of gradual progress in all practicable reforms, has always subjected it to attack from two quarters, from those who want no change and from those who want a total and instantaneous change. Whatever we do, whether we advocate certain moderate reforms in government, the occasional correction of anachronisms, a few improvements in spelling, some minor modifications in costume, a steady development of religious thought, the gradual abolition of established vices, a better system of international relations, or a readjustment of some social injustices, we are sure to have that dog's tail thrown in our face by somebody. Now, this has gone on long enough. We give fair warning that if any correspondent quotes it to us again we shall be strongly tempted seriously to consider the question of removing his name from our subscription list, unless, of course, he has paid in advance. But before proceeding to such drastic measures, let us try the milder method of persuasion.

The only answer to a proverb or an anecdote is another one, for they are not used to convince, but to express conviction. So, when one is met by the metaphor "a rolling stone gathers no moss," it is not worth while to question the desirability of moss, but to reply at once, "A setting hen gathers no fat." Again, the counter to "Don't begin a church with the steeple" is "Don't begin a well at the bottom." So, when people quote to us the adage, "Don't cut off a dog's tail inch by inch," we do not quibble about it, and say that we belong to the S. P. C. A., and that if a curtailment is necessary it would really be better to

find out by repeated experiment how much it is necessary to take off in order to reduce it to a wagable size, if that be the object of the operation. No, indeed. We frankly concede the case to the opposition. It is an exception to the general rule, which is, that progress is the result of repeated efforts. For we, too, can appeal to the wisdom of the ancients, and quote proof texts in any number; for example, "Don't bite off more than you can chew"; "Little sticks kindle a fire, but great ones put it out"; "Step by step goes far"; "Slow, but sure"; "The more haste the less speed"; "Evolution, not revolution"; "The hare and the tortoise," etc. This game of matching proverbs used to give us much amusement when we were children.

The choice between such proverbial antinomies gives the clue to one's philosophy of life, and it seems to us that the advance of science and the increased knowledge of history give support to our position and our policy. THE INDEPENDENT is old enough to remember when the doctrine of catastrophism was dominant and the uniformitarianism that was to replace it had only begun to be felt. A great deal was then said about volcanoes and earthquakes and very little about glaciers and erosion. New species of plants and animals were assumed to have come into existence in an instant or a day instead of being gradually developed from previously existing forms.

History was formerly a record of battles and revolutions. Everything seemed to happen with explosive violence and without any visible cause unless it were the whim of a great man or of a wicked woman. Reading one of the old histories gives one a headache like watching a motion picture when the film runs too slow, transforming continuous movement into a jerky series of scenes. We all know now that this representation of the past was radically false. The great changes, the real advances, have come about by the action of inconspicuous but widespread and long continued forces. It may be true that revolutions never go backward, but it is also true they never go forward so much as they seem to. Revolutions merely revolve. The reason why history repeats itself is because when it speaks quickly people do not understand what it means.

The new conceptions of science and history have had or will have their greatest effect in the fields of sociology and politics. We now realize that languages, institutions and laws are no more immutable than plants and animals. They also may grow or decay, take new forms or become extinct. We cannot prevent their change and it is not usually wise to attempt to retard it, for this is apt to result in distorted forms and mischievous tendencies. What we can do and ought to do is to guide and control the movements which are shaping our social institutions, so that the change that is inevitable may be continually a change for the better. Let each man fix for himself his ideal, not merely an ideal in the blue and hazy distance, but a proximate ideal not too far ahead to be clearly discerned and possibly reached; then let him push forward toward it with such companions as he can persuade to join him. If he cannot move toward it, let him at least keep his face turned toward it, so that people may see which way he would like to go. We do not mean only, or chiefly, the great reformations in politics or religion. We need to set up our little ideals of daily life. If any man thinks he can raise cabbages better, keep books better, spell a word better, or tie a necktie better than is the custom now, then in Heaven's name let him go and do it and that right promptly. He will deserve the world's blessing tho he never get it. For "every little helps." "Despise not the day of small things." "Take care of the pence and the pounds will take care of themselves." "All the rivers do what they can for the sea." "Little strokes fell great oaks."

The Milwaukee Overturn

We did not regret at all the success of the Milwaukee Socialists in the election last autumn, which gave the city a Socialist Mayor and Common Council, and gave to Congress its first Socialist member. But last week there was a big overturn, and in the election of judges and school directors the Socialist ticket was beaten by a vote of two to one. It proves that the previous overturn last autumn was not out of love to Socialism

but out of disgust at boss rule. The figures are impressive. Every Socialist candidate was defeated. Judge Halsey was re-elected by a vote of 25,966 against 11,804 for the Socialist candidate. The Socialist candidate for Alderman-at-large received 12,264 votes, while his opponent had 23,981. The election for school directors was particularly exciting, because the Catholics—and they are strong in Milwaukee—were out against the Socialists, and the Socialists answered back in vigorous terms. Such alignment may be unfortunate, but does not seem to us particularly vicious. Catholics have the right to express their conscientious views, whether priests or laymen, on the platform or in the pulpit; and if the Pope has condemned Socialism, and they think he had the right to, they are perfectly justified in massing their votes against Socialists. And equally, Socialists, if they believe the Catholic Church is a peril to liberty and to the country, and that the Church, with its candidates, is lined up against what they believe in, have the right to attack the Catholic Church and policy with all vigor. That kind of conflict is not unhealthy. Only we cannot quite sympathize with either side; for we discover no such great danger in Socialism, at present, and no such peril coming from the Catholic Church. We judge that the men who follow Congressman Berger are giving Milwaukee quite as good a government as it has had in the past; and if we can judge from the Catholic journal of Milwaukee the men it appeals to are a fine body of citizens.

Russia and the Jews

The Associated Press and the news journals generally have too little to say about the continued persecution of the Jews in Russia. While the Pale system is maintained, which compels Jews to reside in certain districts and excludes them elsewhere, it makes the system and its exceptions the occasion for much cruelty; and of this segregation system, with its necessary evils, Stolypin, the present head of the Russian Government, is a supporter. It is some satisfaction that there are members of the Duma who dare to protest against Jewish persecution. Here is the hope for ultimate relief. What is to be thought of a policy which accuses the Jews of refusing to till the earth, while it prohibits their residence in the small towns and villages? Merchants must live within the Pale, and such cases as this occur, that a watchmaker is driven into the Pale as a merchant if he sells a watchkey or a chain which he has made; and a family driven from home because the mother sold milk in the street. Lately even the educated Jews, who under the law can reside in all Russia, were driven out of Siberia—there must be no Jews there; and in the Caucasus the druggists were expelled because Jewish druggists were not supposed to be educated. We do not wonder that the indignation of American Jews waxes hot over these wrongs, and the specific stories of cruelty and suffering which are brought by refugees. What we have cited above is all taken from speeches in the Russian Duma, and we may add another from a speech by a member, Pokrovsky, who told of a Jewish convert who was given a position as register of passports. One day his sister's passport was given to him and he found her set down as a prostitute. So grieved was he that he committed suicide, leaving a note that he was going to a place where there was no Jewish Pale and no Jewish prostitutes. It turned out that she had been inscribed by an official as a prostitute so as to allow her to attend the university, and when she heard of her brother's death she also committed suicide. It is a Christian Church that commits these cruelties, for Church and State are one in Russia.

Hebrew Farmers

The Jewish Agricultural and Industrial Aid Society proposes a systematic effort to further the movement on the part of Jewish young people to take a hand in the agricultural affairs of the country. It was found some time ago that the Jew can make a good farmer, just as good as his Aryan neighbor. Two years ago free scholarships were established to stimulate the work among the children of Jewish farmers. In the season of 1908-9 seven scholarships were awarded, thirteen during the next season, and this year twenty. The scholarships are awarded by competition, which consists of the writing of a brief

essay upon some agricultural topic, selected by the competitor. These essays are placed in the hands of the authorities of an agricultural college for examination. Seven of the twenty awards this season go to girls, two of them to the wives of young Jewish farmers. The plan is said to be working admirably. The scholars, upon returning home from college, go to work with zeal to rejuvenate and put new life into farm work. Everything is beautified, and economic rations established—producing more milk on less feed. Fertilizers and soil improvement become the rule. Girls take up with poultry and bees and general farming, as well as household economies. Homes are improved in appearance, cooking is made a fine art, and flowers are planted freely. In its annual report the society says that for the Jewish boy and girl to rub elbows with some of the most ambitious children of neighboring farmers is an education in itself, and it expresses a belief that the influence of the scholarships will be far reaching. These boys and girls will act as a leaven, tending to raise the agricultural standards of the Jewish people. The society proposes to co-operate cordially with the general movement for farm uplift inaugurated by Theodore Roosevelt.

The Flickering Film

One hears much denunciation of moving picture shows as a demoralizing influence. Moving pictures, as they are represented, constitute a grave menace, poisoning our fountain at its source, so large a proportion of the visitors are children, or at least minors. Our own observation, however, shows that the pictures and wordless dramas offered are, for the most part, more cleanly and less silly than the usual entertainment of the so-called acting stage. What is more, the standard is rising, whether one gauges it from the technician's standpoint or from the moralist's. Many of the films show scenes that stimulate wholesome laughter, such as is seldom heard at performances of imported farce at two dollars a seat. Many of the plays acted in pantomime, with a word of explanation flashed on the screen now and again, are adaptations of well-known novels of as wide a range as is suggested by the titles of Dickens's works, Bernardin's "Paul and Virginia," and Hawthorne's romances. Another is a series of scenes entitled "The Masqueraders," obviously suggested by the plot of Marivaux's "Jeu entre l'Amour et le Hasard," and not vulgarized beyond recognition, either. Adaptations are frequently made from uncopyrighted plays—William Shakespeare's, for example. Many of the films are educational rather than dramatic; historical scenes have long been represented, and more lately travel and industrial scenes have been illustrated. We learn from a magazine of national reputation, which can tell no lie, that Iola, Kan., after a year of commission government, is proudly showing its neighbors some of the results of its innovation by means of an entertainment of films and slides. In Edinburgh, Scotland, old ladies of Presbyterian principles still frown upon old-fashioned theatrical performances, but crowd the palace of the winking film. There is nothing inherently vicious about the silent stage. It has cut deep into the profits of theaters, especially vaudeville theaters, the world over, simply because it offers better value for the admission price. And it has come to stay. It only remains for us to better its general conditions. Picture theaters should be better aired than they are for the most part, and should be kept cleaner. The proprietors should be obliged to exercise discrimination in their employment of attendants, and the attendants should be obliged to maintain conditions favorable to public morals. Inspection by the police should be a part of the latter's duty. Censorship of the films with a view to the elimination of indelicacy has already been effective in New York City for some months, and with good results.

A Mischievous Proposal

There is an interesting and serious question sent down by the Presbyterian General Assembly to the presbyteries for them to answer and decide. Not long ago the presbytery of New York licensed and then ordained some candidates whom a majority objected to as not orthodox. Complaint was made against the presbytery to the Synod and Assembly, but when the case came to be reviewed it appeared that there was no rec-

ord of the answers of the candidates to questions put to them which would support the complaint. Accordingly the complainants secured a vote that an overture be sent down to the presbyteries to decide whether they would have such a record kept, so that the action by the presbytery can be reviewed by the higher ecclesiastical courts. This means a tedious written examination. The custom has been in the past to give final authority in this matter to the presbyteries. They see the candidate and talk with him. They only can know him, and judge of his spirit and purpose as well as his intellectual equipment and doctrinal corectness. This plan has worked well in the past, and has given to the Presbyterian Church as good a ministry as there is in the world. It gives conservatives and liberals, but all loyal to Christian faith and service. The proposal to change the curtain seems to be a mischievous one and meant to be mischievous.

A Socialist in the Italian Cabinet

For the first time in its history and coincident with the Golden Jubilee of the Kingdom of Italy, Victor Emmanuel III has named a Socialist as Minister of Agriculture in the new Giolitti cabinet. The appointment provoked much comment, which was joined to astonishment when Bishop Bonomelli, of Cremona, praised the royal action and endorsed the new Minister, Bissolati. This bishop, whose pastoral on separation of Church and State was censured by Pius X in his letter to the provincial synod of Milan, went much further than bare approval. He declared that Bissolati, who is the deputy of Cremona, had again and again gotten the votes of his Catholic people, including clergy. This stand of Bonomelli brought out from *L'Osservatore Romano*—the Papal organ—an article in which it declares its approval of a Socialist minister, provided he forgets not social problems in order to foster hate on the part of well-to-do freemasonry. This is meant rather as a hit at Bonomelli than a clap on the back to Bissolati. Today, at home here, Gibbons, Ireland, Riordan, Quigley, have fled to cover. Has Hecker's mantle fallen upon an Italian bishop?

Go West

The Baron d'Estournelles de Constant, for many years a contributor to THE INDEPENDENT, whose article entitled "A Useless War" appeared only a few weeks ago, has written from New York a letter to the *Temps*. "How many changes since my last visits of 1902 and 1907!" he exclaims. And these changes do not seem to disturb our visitor: "Each of my visits to America is for me a great 'cure' of optimism." As is usual with visitors to America from beyond the seas, it is American energy which chiefly impresses him. And whence comes it, he asks—from New York or from Boston? It is worth while quoting the words in which the question is answered:

"No; most of my American friends live in the great industrial cities of the East, yet they themselves have organized my campaign in the South, the West and the North—principally in the Central West.

" 'Go and visit,' they tell me, 'our new cities; lecture to our advance-guard populations.'

"More or less left to themselves to begin with, these isolated populations clear the ground, and till the soil; then, little by little, they engage in founding great towns; become their own bankers; their influence establishes itself and finally becomes predominant. So it is everywhere.

"A Russian minister said to me last year at St. Petersburg: 'The day approaches when we shall be annext by Siberia.'

"The day *has* come when towns like Denver, Kansas City, Minneapolis and St. Paul count for as much in the United States as their elders of the East. In Canada, that inexhaustible reservoir of activity and wealth, I have remarked the same thing. My friends in Montreal, Quebec, Toronto and Ottawa made me promise not to confine myself to their big towns. Go West, always West. The future is there, also the influence is there already."

The remarks of the traveler call for no amplification. We knew their truth before they were spoken, but it is worthy of remark that the shifting of our center of gravity has now been noted even by the proverbial visitor from Mars.

What Is a Pseudo-Bishop?

Three English priests have been formally excommunicated by the Pope. We translate, in part, the sonorous Latin:

"We inform you, with great sorrow, that after long and serious scandal the priests, Herbert Ignatius Beale and Arthur William Howarth, of the Nottingham clergy, seeking their own things and not those of Jesus Christ, after having sought more than once to gain from

non-Catholics the honor of being made bishops, have lately advanced to such a pitch of rashness that, having gained their purpose, they have arrogantly informed us that they had received Episcopal consecration. Nor was there lacking authentic information thereof; for a certain pseudo-bishop, Arnold Harris Mathew, who was the chief agent in this sacrilegious crime, in a letter to us full of swelling words has not feared clearly to confirm it. Indeed, he has not hesitated to arrogate for himself the title of Anglo-Catholic Archbishop of London."

The *motu proprio* proceeds to warn the clergy against the "frauds and snares" of these men, and continues:

"Accordingly the aforesaid priests, Arnold Harris Mathew, Herbert Ignatius Beale and Arthur William Howarth, and all others who have given aid, counsel or consent to this nefarious crime, we excommunicate and anathematize, and we solemnly command and declare that they are separated from the communion of the Church, and hereafter are to be regarded as schismatics, and to be shunned by all Catholics and especially by you."

Of these three priests the Right Rev. Arnold F. Mathew is the Earl of Landoff, and has written many volumes on Church history. We recognize the ecclesiastical duty to excommunicate these men whose Modernism has driven them from their Church, but we fail to see the propriety of charging them with selfish ambition, arrogance, frauds and snares. Nor do we see why a consecrated bishop or archbishop of the old Catholic Church should be called a "pseudo-bishop." We wish Pius X had been content to do his painful duty without assigning motives or calling names.

Absolutely Useless

Absolutely useless is the imposition of the new anti-Modernist oath on all Catholic priests. It is a very long document, in which in nine different ways the errors of Modernism are defined. As every priest signs them, thereby declaring his solemn rejection of the errors enumerated, it is hard not to believe that there must be some mental reservation. This is suggested by such an item as the following:

"I likewise condemn the opinion of those who affirm that the learned Christian man possesses a double personality, the one as a believer, the other as a historian. I reject also that system of interpreting sacred Scripture which prefers the methods of rationalists to the traditions of the Church, the doctrines of the faith and the rules of the Apostolic See."

So it seems that scholars had been compelled to adopt a system of mental reservation by which they can accept as a matter of faith the teachings of the Holy See, while reserving a contrary belief as historians. We would not have asserted that the extraordinary unanimity with which the priests subscribe themselves, "So I believe and swear," was due to such mental reservation, but here we have it acknowledged in the formula of the oath itself that there are such scholars; and if they accept the principle, for the distress of the times, we do not see why they are not likely to apply it to this oath also. It must be hard to be required to swear acceptance of "everything that has been defined by the unerring magisterium of the Church," for example, that Moses wrote the whole Pentateuch; or to deny "the heretical dictum of the evolution of dogmas." But nobody in England or America declines to sign, only in Germany the professors who are supported by the State.

The Government Service

A New York bishop declared that Democrat recalcitrants would not elect Mr. Sheehan to the United States Senate because he was a Catholic and an Irishman. Archbishop Ireland has a better explanation of the paucity of Catholic statesmen, when he complains that it is accounted for by the lack of ambition; and he urges that more Catholic young men enter public life. The Jesuit weekly *America* seems to agree, in a measure, with the Archbishop. It blames Catholics because they neglect to take advantage of the civil service. It says:

"The Civil Service system has been extended so far in this country as to include positions paying salaries as high as $4,000 in many branches of our Government, and these positions are open to competition. The Consular Service is now on a Civil Service basis, and almost all the positions in the forestry division and in our Insular possessions as well. The secretaries of our embassies and legations are now appointed after examinations."

This weekly not only finds fault with Catholics, but offers advice to Catholic colleges, suggesting departments for candidates for a career in the Government service. When we recall that fully three-fourths of the Catholic colleges are in the hands of the Jesuits, it looks as tho they should themselves establish such departments. It is ever easier to preach than to practise. Are the Fathers of the

Society taking on themselves to counsel the Christian—and other Brothers?

A society seeks incorporation in this State, to be called the Free Speech League. Its purpose is to secure, by constitutions and laws, the greatest liberty of speech "consistent with the liberty of all others." It is thus defined:

"Especially to preclude the punishment of any mere psychological offence, and to that end by all lawful means to oppose every form of Governmental censorship over any method for the expression, communication or transmission of ideas, whether by use of previous inhibition or subsequent punishment."

One would say there is pretty free liberty of speech now. What further liberty do they want? Is it such psychological liberty as Anthony Comstock attacks; or is it certain psychological plays on the stage, such as Boston has just suppressed; or is it anarchistic violence? We observe that the sons of two famous clergymen are in the list of incorporators.

The American Journal of Philology quotes from a book by Robert T. Kerlin on "Theocritus in English Literature" the statement that in American papers and magazines the name of Theocritus is not to be found until within the last decade. We fear Dr. Kerlin has read American papers and magazines only within the last decade. The reviewer calls attention to an article on "Tennyson and Theocritus," in *The Atlantic Monthly,* by E. C. Stedman, in 1871. Without going far afield we will mention that THE INDEPENDENT published, twenty years ago and thereabouts, not a few articles by Maurice Thompson about Theocritus. From a poem of his, "Written on a Flyleaf of Theocritus," we quote the last verse:

"Now I would give (such is my need)
All the world's store of rhythm and rhyme
To see Pan fluting on a reed
And with his goat-hoof keeping time!"

What shall be the word to designate a telephone message? The New York Telephone Company has asked this question of its employees and others, and has received considerably over a hundred proposed words. Some are scientific, that is, of Greek derivation, like *telephogram;* others pure English, like *callo* and *tellit;* and a great many mixt of Greek and Latin, like *audigram,* or Greek and English, like *hellogram.* Of the most attractive words we select *bell-call, grambell* (for Graham Bell) and *phonal.*

In one town in the State of Georgia last Saturday three negroes, probably guilty of no crime, were taken by a mob from the jail and lynched. In another town a negro accused of attacking a white woman was taken from the jail and lynched. And this is civilization. The Governor of Alabama does not approve of lynching, and will investigate the first lynching that has just occurred since his incumbency, and threatens to remove the sheriff.

Sir Thomas Whittaker has been reckoning up the waste of British money for intoxicants and he finds that the people spent last year not less than $750,000,000 for alcoholic liquors. No wonder the brewers get rich and find seats in the House of Lords. But there is real improvement. Twelve years ago the people drank on an average 32.53 gallons of beer, but last year 25.99; of distilled liquors 1.09, against last year's 0.65; and of wine 0.41 against 0.28. This means a saving of about $250,000,000 in money, and much more in morals.

Is it graft—perish the thought!—or is it a delicate sensitiveness that has made the lower house of the South Carolina Legislature discard the old desks and chairs and replace them with new? It was urged that the dignity of the State was suffering from the shabbiness of the furniture, and that no man could be asked to sit at a desk and in a chair that had been desecrated by negro occupancy some years ago. Accordingly they have bought new desks and chairs at $25 and agreed to sell the old to themselves at $3, for use in their parlors and offices at home.

The Pain Fireworks Manufacturing Company has gone into bankruptcy owing to the crusade for a safe and sane Fourth of July. When will we hear that the Krupp gun works has shared the same fate?

Insurance

Automobile Insurance

The enormous increase in the amount of capital invested in automobiles, and in the number of persons using automobiles, has developed a new and important branch of insurance. It is estimated that $500,000,000 is invested in automobiles and that 350,000 cars are now in use in the United States. There are four distinct forms of automobile insurance, covering different risks and governed by different rates. Liability insurance protects the assured against loss on account of personal injuries caused by the use of automobiles. Property damage protects the assured against loss on account of damage done to the property of others in the use of automobiles. Collision insurance covers the loss or damage to the insured automobile in case of collision with another object. Fire and theft insurance protects the car to the extent of the insurable value against this form of loss. The rates on these various forms of insurance are low in proportion to the benefits derived, and a large number of automobile owners carry all four policies.

In commenting on the Washington square fire in a recent letter to the *Evening Post*, a good point is made by Mr. Henry Evans, president of the Continental Insurance Company. He calls attention to the fact that a fireproof building bears the same relation to its contents, as a stove does to the material put in it to burn. A building strictly fireproof, but filled with inflammable merchandise, will not burn down or communicate the fire to another building, but the heat generated will kill the human beings in the building. Mr. Evans recommends a revision of the present New York building law.

The city of Syracuse, N. Y., is taking active precautions to guard against a possible conflagration. A committee appointed to present recommendations found that flying embers falling on wooden roofs have proved the greatest menace to property, and therefore advocates a city ordinance to enforce the use of tin or slate on roofs.

The life insurance written by the Metropolitan Life Insurance Company last year reached $150,000,000, which is the limit placed on new business under the Armstrong insurance laws. Toward the close of 1910 the Metropolitan Life was forced to discontinue issuing policies in order to keep its business for the year within this legal limit.

Announcement is made of the merger of the German-American Insurance Company of New York and the Rochester German Insurance Company. The combined assets of the two fire companies will amount to about $20,000,000, the capital to $2,000,000, and the surplus to $8,000,000.

The Legislature of Montana has passed a law requiring instruction in fire dangers and fire prevention in the schools. The great economic loss resulting from fires can be reduced only by an active and intelligent campaign of this character.

The New York Life Insurance Company reports that in a recent week 135 death claims, involving $324,000, were passed on. Of these claims, 80 per cent. were paid within twenty-four hours of the receipt of the proofs, and 94 per cent. by the third day.

Fire losses and the cost of fire prevention in the United States amount annually to $450,000,000, or more than the total American production of gold, silver, copper and petroleum in a year.

It is estimated that $17,000,000,000 of life insurance is carried by inhabitants of the United States. This represents an increase of $8,000,000,000 or 88 per cent. in the last ten years.

If buildings in the United States were as fireproof as in Europe, the annual cost of fire losses and protection would be only $90,000,000.

Financial

Railroads and Their Coal

The commodities clause of the Hepburn rate law was designed to prevent railroad companies from owning and operating coal mines, and was aimed at what had become practically a monopoly combination in the anthracite coal industry. An interpretation of the law two years ago by the Supreme Court made it ineffective. This was a general belief. By a decision announced last week the original interpretation is revised or explained. It was held in the first decision that ownership of stock in a coal company was not such an interest in the product as would prevent a railroad company from carrying the coal. In the later decision the court explains that the Government still has the right to question the power of a railroad company to carry the coal if its stock interest is used to "obliterate all distinction between the two corporations"; in other words, if the two companies are really only one.

The attorney who represented the Government says this gives the law force, will correct the evil at which the statute was aimed, and "will divorce the railroad business from the coal business." We cannot agree with him. A test is to be made in further proceedings relating to the Lehigh Valley Railroad Company, with respect to which direct and complete control of the coal can be shown. But if a violation of the law be proved, a readjustment of relations will probably meet the requirements of the decision without really separating the railroad company from its coal interests. If the railroad company, following the Lackawanna's example, should organize a new corporation for its coal property and distribute the shares among its own stockholders, absolute control would still be exercised, but a decision of the court against such a readjustment, if it could be obtained at any time, would be procured only after much delay. It is by no means clear that the plans adopted by certain other anthracite railroad companies will be condemned by the court as obnoxious to the statute. It will be extremely difficult, if not impossible, to compel by statute an actual separation of the coal industry from the railroad business. Control, once obtained, can be kept by indirect methods which it may not be possible to attack successfully under the prohibition of the commodities clause. We are inclined to think that the evils disclosed can be dealt with more effectively by investigation, exposure, prevention of discrimination and official regulation of carrying charges. It may be observed that the decision has not affected the prices of anthracite railroad shares.

....The Night and Day Bank, which has done business at Fifth avenue and Forty-fourth street for several years past, has been converted into the Harriman National Bank, with a capital stock of $200,000. It is named after the late E. H. Harriman, and Mrs. Harriman is the largest depositor and stockholder. Joseph W. Harriman, nephew of the late railroad capitalist, is president.

....Following the recent purchase of control of the National Bank of Commerce by a powerful banking syndicate, five new directors have been elected, as follows: Francis L. Hine, president of the First National Bank; Frank A. Vanderlip, president of the National City Bank; Albert H. Wiggin, president of the Chase National Bank; William A. Simonson, president of the Second National Bank and vice-president of the National City Bank; William A. Day, vice-president and acting president of the Equitable Life Assurance Society. The three first named have been added to the finance committee. As they represent the three most important rivals of the Bank of Commerce, their association furnishes a very interesting example of banking community of interest. The deposits of the four banks are $540,000,000.

The Independent

VOL. LXX NEW YORK, THURSDAY, APRIL 20, 1911 No. 3255

Survey of the World

Doings in Congress

Upon the reconvening of Congress last week Mr. Underwood, of Alabama, Democratic chairman of the Committee on Ways and Means, reported to the House the Canadian Reciprocity Bill, which was laid temporarily on the table. Immediately Mr. Rucker, of Missouri, chairman of the Committee on Elections, reported to the House a joint resolution providing for the direct election of United States Senators. This is the same measure as that introduced at the last session by Senator Borah (Republican) of Idaho, and does not embody the Sutherland amendment. It received all the Democratic votes but one, and all but fifteen of the Republican votes in the House of Representatives. The Rucker publicity bill, providing for the publication before election of campaign expenses incurred by Congressional candidates, was passed by the House, April 14, the vote being 302—0. An amendment requires the inclusion of the primary election expenses, this being a blow at Southern Democrats, whose nomination is equivalent to election. The amendment was offered by Mr. Jackson, Republican insurgent from Kansas. In the Senate, Mr. Kern, of Indiana, Mr. Beveridge's Democratic successor, has offered an amendment to the law requiring publicity of campaign contributions at elections for members of Congress. By this bill publicity is required before as well as after election. The amendment would require the publication not earlier than fifteen days nor later than ten days before election, and every six days thereafter until election. A full publicity of all contributions and the names of contributors within thirty days after the election is also required. The return is to be made to the clerk of the House of Representatives under oath by the treasurer of each political campaign committee.——The promptness of the Democratic leaders to put forward their announced legislative program has taken by surprise the Republican minority in the House and the Senate majority. Not content with planning the approval of the Taft reciprocity plan, the Democratic members of the Committee on Ways and Means have already ordered a favorable report on the "farmers' free list" amendments to the Payne tariff law. The seven Republicans of the committee voted in opposition. The list of articles to be placed on the free list, as set forth in the bill, includes plows and other agricultural implements, bagging for cotton, etc., hoop or band iron and other fastenings for baling cotton and other agricultural commodities, various leathers for shoes and saddles, wire for fences, dressed meats, cereals, timber, salt, and sewing machines.——The Customs Court, in a decision rendered April 10, held, in effect, that the so called favored nation clause in the existing commercial treaties with England, France and Germany would not give them the right to ask the extension to their traders of low duties conceded to Canada under the proposed reciprocity treaty. Canadian reciprocity was not, indeed, in question; but it is believed that the court's ruling in a contest over the rate of duty to be imposed on whisky imported from England by a New York dealer, who claimed the lower rate imposed on importations from France, will cover also the situation arising in the event of the ratification of the agreement with Canada.

Projected Legislation

The speed with which the new House of Representatives has thus far acted is far from guaranteeing an early adjournment. For one thing, the Democratic party refuses to be limited in the subjects of its investigation and legislation. It was anticipated that a radical revision of Schedule K of the Payne-Aldrich tariff law, the "wool schedule," would be proposed in a bill reported this week or early next week by the Committee on Ways and Means. The House Democrats mean to undertake an exhaustive inquiry into the activities of the nine executive departments. They hope to disclose Republican extravagance in administration that will be useful in the next presidential campaign. The nine House committees which, under the rules, are authorized to scrutinize the expenditures of the various departments, have been inactive in the past, but will now take on new life and vigor.—— Senator Cummins, of Iowa, has introduced a bill requiring the National Monetary Commission to make a final report not later than December 4 and to amend the act creating the commission to make it expire on December 5. The principal criticisms directed against the commission are that there is no limitation of the body's power to expend public moneys, and that many former Senators and Representatives have got appointments equal in salary to their seats in Congress. Senator Cummins is expected, also, to put into the form of amendments to the text of the Canadian agreement provisions looking to the local interests of his constituency. He is said to favor certain items of the House "farmers' bill"—the Democratic measure providing for free coal, free iron ore, free lumber—none of which is produced in his State. But he objects to free shoes or free leather, as the two items stand together, for Iowa farmers sell hides from which the leather is made.

The Junior Senator from Iowa

Former Judge William S. Kenyon, of Fort Dodge, has been elected to succeed the late Jonathan P. Dolliver as Senator from Iowa. All of the Senatorial contests except that in Colorado are now terminated. Sixty-seven ballots were required to fill the Iowa Senatorship. The new Democratic Senator was born at Elyria, Ohio, in 1869, and is a former student of Grinnell College, Iowa. In politics he is a progressive Republican, and his election is believed to gratify his colleague, Senator Cummins. Judge Kenyon succeeded Wade H. Ellis as the Attorney-General's specialist in suits against combinations in restraint of trade. The Senator-elect will not qualify as a member of the National Congress until the important anti-trust prosecutions, which he is now conducting, have been arranged for. Attorney-General Wickersham has said of the new Senator that he regards him as "one of the most clearheaded, able lawyers, and one of the most highminded" of his acquaintance. The President is gratified at the choice of the Iowa Legislature.

Ambassadorial Changes

The resignation of Dr. David Jayne Hill as our Ambassador to Germany has been accepted by the President, and will take effect July 1. This resignation confirms earlier rumors. Friction between Dr. Hill and Secretary Knox has been suspected, and it has been stated that the former's action in the "potash controversy" has been unsatisfactory to our State Department. This has, however, been denied at Washington.—— William Woodville Rockhill, Ambassador to Russia, will succeed Oscar Straus as Minister to Turkey, and will be succeeded at St. Petersburg by former Governor Curtis Guild, Jr., of Massachusetts.

Various Items

Michael S. Link, a former member of the Illinois State Legislature, who was indicted by a Chicago grand jury for perjury and turned State's evidence in the investigation of the election of William Lorimer as United States Senator, was found dead in a bath tub in his home at Mitchell, Ill., April 10. Death was caused by apoplexy. Link admitted, after indictment for perjury, that he had received a bribe of $1,000. Later he

stated that the $1,000 was a gift, and that it had no bearing on the Lorimer-Hopkins contest. His death occurred on the eve of the resumption of the investigation of the Lorimer election by the Helm Committee of the Illinois Legislature.——The bill of Assemblyman Walsh, of New Jersey, providing for a commission form of government in cities, was passed by the State Assembly April 11. In its final form the bill provides for the initiative and referendum, but the recall provision is nullified. The bill was amended also so that it should not become operative in any city until indorsed by at least 40 per cent. of the vote cast at the last preceding election. Before the consideration of the bill in the House, Governor Wilson sent a special message to the Legislature advocating its enactment as a reform much needed in the municipal governments of the State. A mass meeting at Paterson, N. J., decided to ask the Legislature to amend the proposed bill so as not to include Paterson in its provisions. The meeting passed a resolution to the effect that Paterson is satisfied with its present form of government thru which the Mayor appoints all commissions, Republican, Democratic and other speakers joining in praise of Mayor McBride and his appointees. The commission bill must be voted by the New Jersey Senate before becoming operative.——Tornadoes killed about seventy-five and injured more than one hundred, besides rendering 500 persons homeless, April 12, the region devastated being in the States of Missouri, Oklahoma, Kansas and Arkansas. Great damage to crops is reported.

The Mexican Question

There was published in several newspapers, on the 10th, a story in which it was asserted that Ambassador Wilson procured at the Mexican capital a photograph of a secret treaty, in which Mexico granted to Japan a coaling station and colonization privileges, and that on account of this agreement our troops were sent to the border. Emphatic denial was promptly made by President Taft, who authorized Senator Burton and several other members of Congress to say that there was not one word of truth in the tale. Senator Bacon, a Democrat, said he had seen all the correspondence, and that Japan was not mentioned in it. He exprest confidence in the President and commended him for moving the troops. Speaking in the Senate, Mr. Rayner, a Democrat, exprest similar opinions, and declared that no suspicion as to the attitude of Japan had caused the military movement. Following him, Senator Cullom and Senator Lodge asserted that the reports involving Japan were false. Mr. Lodge added that there was evidence that the story about Japan was "kept alive by some concerted plan, by some wealthy interest, or by some nation with ends of its own to further." Representative Foster, of the House Committee on Foreign Affairs, said he was convinced there was a criminal conspiracy designed to cause war between Japan and the United States, that much money was being expended by the conspirators, and that it was in the interest of those who desired that many battleships should be built. No attempt to confirm or defend the story about the photographed treaty has been made by the newspapers that published it.——At the Mexican capital, Congress appropriated $4,000,000 to support the movement against the revolutionists. It was announced that Governors would soon be chosen by popular elections in six States. The election in Sonora will take place on the 23d, and it will be the first in many years. A newspaper at the Mexican capital recently gave much prominence to a letter urging President Diaz to resign, and it is pointed out that the editor has not been sent to jail. Señor Dehesa, recently Governor of Vera Cruz, who, it is said, will be made Secretary of the Interior, and has been mentioned as a compromise candidate for the Presidency, says he thinks Diaz should remain in office to carry out the proposed reforms——Propositions for a peace agreement were unofficially laid before Madero last week, but he insisted upon the immediate resignation of Diaz, to be followed by a free election.——A Socialist paper asserts that the Mexican Liberal Socialists made an agreement with Madero; that on account of it hundreds of American Social-

ists crossed the border and joined the revolutionists; and that Flores Magon, who promoted a former revolt, has been attacking Madero bitterly in the Socialist and revolutionist paper which he publishes at Los Angeles and is thus doing much harm.——Following the battle, on the 13th, at Agua Prieta, on the Arizona boundary, when three persons were killed in the adjoining American town of Douglas, dispatches from the Mexican capital said that intervention by the United States was expected there.

The Battle at Agua Prieta

Agua Prieta, a railway terminal, is separated from Douglas, Ariz., only by a boundary line. The Federal garrison of sixty-five men was attacked on the 13th by 250 revolutionists under the command of Red Lopez. For three hours there was sharp fighting, and the revolutionists were successful. As the two towns are practically one, and as most of the fighting was very near the boundary line, hundreds of bullets fell in the streets of Douglas, or struck the houses there. Three Americans were killed, and eleven were wounded, in Douglas. Hundreds of persons had gathered on the American side, near the line, to see the battle. Several of these sightseers were wounded, but two Americans were killed while engaged in their work as railway employees, and one woman was dangerously injured while sitting on the veranda of her house. When the defeat of the garrison was at hand, Captain Gaujot, commanding a company of United States cavalry stationed at Douglas, crossed the line and urged them to surrender. They preferred to fight, but in a short time thirty of them fled across the line and were disarmed by the cavalry. The revolutionists then had full possession of Agua Prieta, and their number was increased a day or two later to about 1,000 men. The leading citizens of Douglas promptly sent telegrams to the President, asking if there "was no way in which Americans" could be "protected in the peaceful pursuit of their affairs." The reply exprest the President's regret and said he had directed Secretary Knox and Secretary Dickinson to "take steps by which such deplorable occurrences might be avoided in the future." On the same day our Government addressed an emphatic warning to the Mexican Government and to the revolutionist leaders. Both were told that battles hereafter must not be fought so close to the line that the lives and property of Americans would be imperiled. It is understood that our Government promised to "use force" for the protection of its citizens if this warning should be disregarded. The President, it is said, felt that this affair on the boundary had proved that he was justified in moving the troops to the border. On the 15th, the Sixth Cavalry was ordered to proceed from Des Moines to Arizona. A part of the regiment was sent to Douglas, and a part to Nogales, 80 miles west of that town.——Uprisings and engagements in many parts of Mexico were reported during the week. There was fighting for three days at Velardena, near Torreon; plantations in Yucatan were raided; bandits were at work in Jalisco; an outbreak in Tabasco caused the Governor to flee for safety; and by a sudden attack upon the city of Zacatecas 300 revolutionists captured a consignment of arms recently received by the Federal troops there. In Sinaloa there were several independent bands of rebels, and no less than four new revolutionist candidates for the Presidency. Revolt met no opposition in that State, except at Mazatlan and the capital. By the destruction of six bridges the railway southward from Eagle Pass was disabled for a month to come, and Laredo was left as the only railroad gateway into Mexico. The loss of these bridges cut off the coal supply of many mines and smelting works. Juarez was menaced by 3,000 men, and at the end of the week the garrison was repelling an assault at Bauche, 14 miles south.——On the 11th, the British warship "Shearwater" landed thirty marines and a machine gun at San Quentin, Lower California, because the revolutionists were preparing to attack the town, the officials had run away, and British and American residents asked for protection. But the revolutionists did not come, the marines were withdrawn, and the ship went northward to San Diego.——The Mexican Government has called for volunteers, to serve six months.——A Government force of

1,200 men moving northward attacked the rebel outposts a few miles from Agua Prieta on the 16th, and on the following morning began an attack upon the town itself. The rebels had thrown up intrenchments, which, for some distance, were only 100 feet from the boundary. The warning of our Government was conveyed to both commanders by civilian messengers, and both promised to avoid, if possible, killing or wounding any of the residents of Douglas. A part of the instructions given to the American commander by the War Department was as follows:

"Under no circumstances allow any of your men to cross the boundary. Prevent, as far as possible, any violation of the international laws thru crossing of armed troops or individuals from Arizona to Mexico. In case either Federals or insurgents enter American territory, disarm them and hold them for further orders."

Champagne Riots

During the week the disorder in the champagne region has grown worse and millions of dollars' worth of property have been destroyed. The trouble originated in the attempt of the French Government to restrict the area entitled to use the name "champagne" for the product of its vineyards. At the prospect of the enforcement of the law, which was passed in 1908, the vine growers of the department of the Aube, which was excluded from the champagne district, began a series of riotous demonstrations and displayed so much strength and determination that the Government showed a disposition to weaken and compromise the question. The Senate passed a resolution against the delimitation. This in turn aroused the populace of the Department of Marne, whose monopoly was threatened by the proposed inclusion of the Aube. A series of well organized attacks were made upon the manufacturers of Epernay and vicinity, who were suspected of favoring the aspirations of Aube in order to increase the supply of cheap grapes from which they could make champagne to be sold in competition with the famous brands. At Epernay, Ai, Damery, Venteuil, Moussy and other towns the wine presses were demolished, warehouses burned, and many millions of bottles of champagne broken, literally flooding the streets with wine. Premier Monis appears to be less capable of dealing with such disturbances than his predecessors, Clemenceau and Briand. He was slow in sending troops to the threatened region, and when he did send them they were not able to get to the villages during the rioting because the telegraph and telephone lines were cut and the roads were barricaded with walls of stones and piles of grape carts and barrels. The broken bottles that were deeply strewn over the streets interfered with the passage of automobiles and cavalry. For the first time in the history of the world aeroplanes were employed against mobs and did good service in discovering and reporting the gatherings of the peasants and their lines of march. In many places the vineyards have been uprooted and the villas of the owners sacked and burned. The proprietor of one wine establishment offered the rioters $1,000 if they would let his cellars alone, but they refused to be bought off and smashed 500 casks of wine. The anarchistic disposition of the mob was manifested everywhere by the red flags and the singing of the "International." Women took a prominent part in the demonstrations as singers and incendiaries. In order to keep back the cavalry while the work of destruction was going on, women and children lay down across the road and defied the troopers to trample on them. Three cavalrymen were reported to have been wounded by a bomb thrown by a child. There are now over 20,000 troops in the district. The Chamber of Deputies voted against the Senate resolution for the inclusion of Aube and Premier Monis has announced that the Council of State will consider the question of delimitation.

Stolypin's Triumph

By the unexpected use of a technical provision in the Constitution, Premier Stolypin has secured a dominant position both in the Government and in politics. In pursuance of his policy of nationalization he drafted a bill for the establishment of zemstvos or local assemblies in six western provinces, where the system had never been extended. Provision was made for the separate voting and representation of the orthodox portion of the population, so they would not be entirely excluded by

the Polish majority. But the reactionary element were unwilling to permit a further extension of representative government under any conditions, and the Council of the Empire voted against the measure, at the instigation of P. N. Durnovo and Gen. Vladimir Trepov, Governor of Kiev, who assured the members that the Czar would approve of their action. At this Stolypin forced the issue by presenting his resignation to the Czar, and could only be persuaded to withdraw it by being promised a free hand. On being reinstated with full power he settled the matter by the issuance of three imperial edicts. The first suspended Trepov and Durnovo from the Council until December 31, which is the date when their commissions expire. The second edict prorogued the Council of the Empire and the Duma for three days, and in the meantime the third edict was issued, enacting the zemstvo law as an emergency measure. According to Section 87 of the Fundamental Laws the Czar has a right, when parliament is not in session, to put into effect any law that he may deem necessary, on condition that the measure is brought before parliament for approval when it next convenes. The opponents of the Premier hold that he has made unwarranted use of this provision by creating a short and artificial recess in which to apply it, and that such action destroys the value of the constitutional restrictions and gives the Premier absolute power over legislation. Stolypin defended the action before the Council when it reassembled by saying the monarch was sole judge of what constituted the extraordinary circumstances under which he could employ this power. The Council, at the conclusion of his speech, voted its disapproval of his action by 99 to 53.

A Spanish Secession

The town of Canillas de Aceituno proclaimed itself a republic on April 10. The people of the town rose and attacked the barracks of the civil guard and several persons were injured in the fighting. An outbreak of this kind is not unknown in Catalonia, but the Province of Malaga, on the Mediterranean coast, near Gibraltar, has not been given to anti-dynastic risings. As the population of Canillas is only about 5,000, the Government was not seriously alarmed, and a force of gendarmes was able to put down the "rebellion." Still, the incident, however slight, is not insignificant, for republican sentiment has become very strong in Spain in recent years, and the successful revolution in Portugal has undoubtedly done much to strengthen it and encourage its hopes. The republican leaders in Spain are well known to be in close correspondence with the Portuguese, and the Spanish Government has been obliged to warn the Provisional Government that Portugal cannot be used as a basis of conspiracy for the overthrow of the monarchy. A club at Lisbon has been closed on this account. On the other hand, the Portuguese Government has called the attention of the Spanish Government to the fact that Portuguese monarchists who have taken refuge in the Spanish Province of Pontevedra are there planning a counter revolution in Portugal. The Governor of Pontevedra has been instructed by his Government to require the refugees to move further away from the frontier. The republicans in the Cortes are making what political capital they can out of the Ferrer case. When Premier Canalejas presented his reorganized Cabinet to the Cortes, he announced that the former Minister of War had been left out of it because he wished to put a stop to the debate on the execution of Prof. Ferrer, but that now under the new Government the debate would be allowed to go on. The new Cabinet will also give more united support to the Premier in his anti-clerical measures, soon to be introduced. The Archbishop of Burgos has protested in the name of the Church against the presentation of any measure for the expulsion of the religious orders from Spain, on the ground that it is a violation of the concordat with the Vatican.

China

The $50,000,000 loan to China, which has been the subject of international discussion for many months, was concluded on April 15. Financiers of the United States, Great Britain, France and Germany will participate in the loan according to the

agreement. The bonds will be issued at 95 and will bear 5 per cent. interest, running for forty-five years. Five million dollars from each country will be available immediately, and as much more when the proposed currency reformations and the plans for the expenditure of the funds have been approved. This is the first time that America has entered into the financial counsel of nations regarding Chinese affairs. At first the Chinese Government had arranged to borrow the entire sum from Americans, but on the protest of the financial interests of other nations it was made a joint loan. The banking interests concerned are the Morgan houses, the Hongkong and Shanghai Banking Company, the Bank of Indo-China and the German East Asiatic Bank. China agrees to reform the currency and to abolish the likin or local customs. A financial expert from one of the countries not concerned in the loan will be made advisor to the Chinese Government. The Japanese banks which were not given a share in this loan have advanced $5,000,000 for the reconstruction of the Peking-Hankow Railroad, on the same terms as the other loan.——The plague epidemic in Manchuria has practically died out as suddenly and mysteriously as it arose. An International Medical Conference is being held at Mukden to study the question and consider the future policy. The conference is presided over by Dr. Wu Lien-teh, director of the Army Medical College at Tien-tsin, who as chief of the Chinese Sanitary Commission has done most to check the disease by preventing the spread of infection. Dr. Wu is a Cantonese who studied medicine at Cambridge University. He took with him to Manchuria twenty Chinese doctors and thirty attendants, and these, with the cooperation of the official and missionary physicians, did what they could in their care of the sick and the enforcement of quarantine. The total number of deaths were exaggerated in the newspaper reports but there could be no exaggeration of the virulence and fatality of this form of the bubonic plague. There were no authentic cases of recovery. In the chief plague hospital at Harbin 1,600 patients were admitted and 1,600 died. The total mortality during four months is estimated at 41,000, which is less than half the number of plague victims in India for the month of February alone. The disease, however, seems to be of a different type, affecting the lungs and not conveyed by rats and fleas, but directly from the breath like consumption. The epidemic is believed to have arisen from the Manchuria marmots, which were trapped by the Chinese for their skins. The disease has not spread so widely from its centers in Manchuria as was feared, because the contagion was direct and the disease swiftly fatal. The physicians and attendants who wore masks were able to protect themselves. Dr. Mesney, a French physician, took off his mask to place his ear against the chest of a patient when the patient coughed in his face and infected him with the fatal disease. Pere Delpal, who was called to a Chinese village to take care of his fellow missionary and boyhood friend, Pere Metillot, dying of the plague, kissed him on the lips and died within three days. ——There is no improvement in the famine conditions in Southern China. The districts have been recently flooded with heavy rain, making it difficult to import grain. In one small town sixty girls were offered for sale in order to get food, but no one could afford to buy them.

Foreign Notes

The veto bill is being forced thru the House of Commons in spite of the dilatory tactics of the Opposition, which, in order to postpone the inevitable as long as possible, offered more than a thousand amendments. To overcome this, Premier Asquith is making use of what is popularly known as "kangaroo closure," according to which the chairman of the Committee of the Whole skips over such amendments as he is not willing to discuss. —— Anti-Mormon riots still continue in England. The missionaries have been driven out of Heywood, and the people of Birkenhead have adopted the same tactics. A mob attacked the Mormon meeting house and smashed the windows. When the police attempted to interfere they were stoned. Several persons were hurt in the fight. ——English shipbuilders have secured the contract to construct two new Dreadnoughts for the Turkish Government.

The Japanese Government and Missionaries in Cho-Sen

BY J. H. DE FOREST, D.D.

THE official name for Korea, by the act of annexation, has become Cho-sen. "It's too bad to change the name of a historic people," remarked a prominent lady in Tokyo. "How would we like it if Japan should annex half of the United States and call it Tsukiji?" Of course we wouldn't like either the annexation or the name Tsukiji, which is the name of the old foreign concession in Tokyo. But the fact is Cho-sen is the historic name of the entire peninsula, of which Korea was only a province. Look at Dr. Griffis's "Korea, the Hermit Nation," below which title are two characters that read "Cho-sen, the Land of the Morning Calm." No patriotic feelings have been outraged by restoring this historic name to its proper place; and Western histories, geographies, missionary magazines and newspapers, by adopting this name, will be in accord with the best traditions of this ancient peninsula.

The annexation has brought a great and successful missionary work into a very different environment, and has given it such a political prominence that the press of Japan has kept it constantly before the public during an entire year. Even the widely informed Count Okuma does not hesitate to give his ripe opinions on this subject to the public. There have also been gross misunderstandings of it by some of the newspaper correspondents in Keijo (Seoul), whose erratic writings have prejudiced many against missionaries. Early this year, when the press here in Japan began to teem with this subject, I very much desired to go to Cho-sen and see how the new political environment was affecting this unique missionary work in which the Christians of the United States are so deeply interested; for political environment always affects for good or bad every department of mission work, and since missions are rapidly becoming one of the great world movements, they cannot be properly understood apart from their relations to existing governments.

It may safely be asserted that Japan, of all the great mission fields, has the best political environment for missionary work. We have here religious liberty under the protection of a just and strong government. If officials interfere with what missionaries wish to do, it is to control the methods of propagation, and not to meddle with the faith of believers. A missionary cannot set up schools and teach what he pleases; he must get official permission and have his buildings and text books conform to the Government standard. But he may build churches, hold numberless Bible classes, organize Sunday schools, and preach with absolute freedom. If certain army officers refuse to let a recruit bring his Testament into camp, it is carefully explained by saying: "You can believe what you like so long as it does not interfere with your duties, but while in camp you will have not only severe drills and work, but a course of practical study, and you will have no time for reading books of any kind. So you'd better leave your Bible at some friend's house in the city, and on your weekly holidays you can go there and read as much as you like." If certain principals of schools dismiss a Christian teacher or pupil, the official reason is never a matter of religion. In fact, both in the army and in schools of all grades are found prominent Christians, and also several of the Government advisers in philanthropic work and in the supervision of religions are open Christians, freely speaking and writing and working from the Christian standpoint.

It is this firm and orderly and impartial government of Japan that has taken up the total problem of Cho-sen, missionaries and all. If the thousand missionaries of Japan can work with no special complaints against the govern-

ment, and are even grateful for such a political environment, one might naturally expect that the four hundred missionaries of Cho-sen could do the same. And yet the problem is by no means so simple as that. It is open on many sides to real misunderstandings, and to very delicate situations that do not appear in missionary reports, but which persist in the press of the East. It is because the missionary body is so splendidly Christian in its character, and because the government is so sincere in its purpose to be true to the principle of religious liberty, that this missionary problem has not flared up into international proportions.

One of the first things that I heard in Keijo was that a disaffected native pastor was openly going from house to house where Christians lived, giving out a printed tract that urged Christians to desert the missionary churches and establish their own, wholly independent of foreign supervision, and he added with a voice loud enough to be heard all over the street, "The Government is behind me in this."

THE CONGEGATIONAL CHURCH, HEIJO.
This is the only church in Cho-sen that has both a Japanese and a Chinese membership.

Knowing as I do the attitude of the Government toward religious questions, I unhesitatingly told my missionary friends that the disaffected pastor had wildly overshot the mark, as it was impossible for the Government to be doing any such underhanded work. The next day, in an interview with the Resident-General, Viscount Terauchi, I told him of the incident, tho I knew what he would say. These are his words: "This Government has nothing whatever to do with such questions. All sorts of people use my name, and even say in print that I endorse their plans. The Buddhists are flocking in here in amazing numbers and have published that I want them to come and am financially backing them. There is not a word of truth in it."

The attitude of the Government toward Christianity can easily be seen from these facts: Some of the highest officials in direct relations with the Resident-General are Christians. Mrs. De Forest and I spent a day visiting the public and private schools of Keijo (not missionary schools), and the inspector who guided us was a Christian, as were several of the teachers we met. We received a call from several army officers, and one of them was a colonel whose sincere Christian record runs back over a decade, and whose entire family are entrusted to the spiritual care of the Sendai Congregational Church. I heard of a captain of gend'armes who had been very cordial with missionaries in Kaijo (Songdo), and discovered that he was one of my former pupils, a member also of the Sendai Church. A telegraph official came down the line to meet us, a warm Christian friend. A policeman at one of the stations introduced himself as a Methodist Christian from Nagasaki. I was simply astonished to find in Heijo (Pyeng Yang) among the officials in the Court of Appeals seven Christians. All these and more, too, I met accidentally, since I never inquired about the number of Christians in the service of the Government, for of course they are not employed because they are Christians, but because they are successful in their duties.

One more illustration should not be omitted—the Y. M. C. A. and the place it has won in the Cho-sen Government. The Korean branch, with rare foresight, goes in for educational and industrial training with schools open day and night, thus gaining a fine moral and religious control over hundreds of young men. For this conspicuous moral influ-

A VIEW OF HEIJO
From Dr. Noble's house. The nearer church edifice was built by the Presbyterians, and holds over 1,000; the distant one is the Catholic Cathedral.

ence and its successful educational work it has been receiving an annual grant from the Korean Government of 10,000 yen. Viscount Terauchi told the secretaries that the new Government could not continue this policy, but that in consideration of their past record he himself would see that the grant somehow should be continued.

The Japanese branch, under Mr. Niwa, a name well known in Western Y. M. C. A. circles, is adopted by the Government railroad to give moral instruction and inspiration to the hundreds of railroad employees along the line. To no other religious organization is this branch of the work entrusted. It carries with it the privilege in some cases of free transportation anywhere, of house rent, and salaries for some of the secretaries. At Mr. Niwa's invitation, I was given a free pass over the roads in the northern half of Cho-sen, and addressed three large audiences of railroad men.

It is necessary to state the attitude of the authorities thus fully in order to have a right perspective of the work of missionaries and of their attitude toward the Government. For many lawless and brutal acts on the part of Japanese rascals hitherto have shocked the missionaries who have witnessed them, and naturally these wrongs have made some of them doubtful of the Government that did not prevent such deeds. There is no use in trying to cover up or minimize the shameful wrongs that bullying Japanese have committed on the natives, or the repeated and persistent insults they have offered to different missionaries. I slept in a room of a missionary house where a worthless Japanese soldier with drawn sword had chased an inoffensive old man and cut him down. His gashed head was sewed up by a near medical missionary. This was some two years ago, when the Japanese Government did not have things well in hand and much disorder prevailed thru the peninsula. Yet I wondered how the missionary's wife, who was terrified by this frightful invasion of her house during her husband's absence, or the medical missionary who cared for the wounded native, could ever think kindly and rightly of the Japanese as a whole. And yet, they really had the right perspective and spoke even glowingly of the true Japanese whom they knew, and of the Government in whose righteous purpose they fully believe.

It is to the great praise of the missionaries in Cho-sen that they, so far as I could learn, have precisely this attitude. They are broad minded enough not to be too severe on the Government for what lawless Japanese have done in the unsettled days of the past. They know that insults and brutalities are unavoidable, even on the part of occasional under officials, in such transition times as Cho-sen has witnessed. And of the present Government, here are some of their opinions, which I believe represent pretty well the entire body of missionaries: "Annexation is now a fact.

SEVERANCE HOSPITAL, KEIJO.
The cost of the entire plant was about $70,000.

and therefore many things that were giving trouble are now settled easily and naturally. The people already dress better, eat better and do better." I asked whether they as a body would prefer to go back to the earlier political conditions, and the reply was: "No, it is much better now in many ways. It is done now, and everybody feels the advantage of a settled government with a fixed purpose to be fair."

To my repeated inquiry about the attitude of the native Christians, a large body, roughly estimated at 200,000, I was everywhere told: "It pays missionaries to make only subjects loyal to the powers that be. It is a part of our business." "The Christians of Cho-sen are a law-abiding and orderly body of people. They are taught that it is a Christian duty to honor and obey those who rule over them." I heard again and again this statement that is worthy the sympathetic consideration of the Government, and ought to give a wave of joy to the supporters of missions in the States: "Had it not been for the large bodies of order-loving Christians in the large cities, the excitement and hatred against Japanese at certain critical times would have broken out into uncontrollable riots that would have made the streets run with the mingled blood of Japanese and Cho-senites. But the Christians, by refusing to countenance resistance, acted as a brake on the unbalanced crowds, and thus made it vastly more easy to maintain order." I believe the Japanese Government understands this great benefit that the work of missionaries has given to the stability of society all thru these trying three or four years. They certainly had a very delicate situation confronting them day and night. If they showed political sympathy with the people of Cho-sen, they were liable seriously to offend Japan. If they were too pro-Japanese, they would weaken the affection of the Christians, who could not but feel the loss of their country's independence. They have done nobly in saving their great work as a distinctly Christian movement, one that saves men from sin, that makes for family purity, that is all aflame with enthusiasm to bring the people to Christ. Never once to have been ensnared in unworkable politics is a real crown to this missionary body of Cho-sen.

In this new environment trying misunderstandings and all sorts of wretched rumors are bound to get into print. The motto adopted by the missionaries, "A million converts for 1910," was perverted by a Japanese newspaper to mean that the United States missionaries are trying to rush as many as possible into their churches in order that the Christians may get political aid from the States against the aggressions of Japan! It was recently published in many Japanese papers that the Korean Christians were leaving the churches by the tens of thousands because they had at last found out that the missionaries could not protect them any longer under extra-territorial privileges. The United States history that missionaries in all innocence were teaching was exaggerated into a plan to teach political independence to the pupils. And a recently promulgated order by the Government that the seven Japanese national holidays should be henceforth observed everywhere in Cho-sen, on which days schools should be closed and Japanese flags displayed, gave rise to a wide and serious misunderstanding. For the word Matsuribi ((holidays) means, in Cho-sen, bowing down and worshiping, while in the official language of Japan it has no religious significance whatever. With thousands of Christians, whose sincere faith would lead them to death before they would bow down and worship any other than the true God, it was an anxious time until the Government announced that nothing of a religious nature and no question of conscience were involved. Some missionaries were relieved to learn that we missionaries in Japan never had any trouble over the national holidays after we once understood them.

It was such rumors and misunderstandings that led Count Okuma, a strong friend of the missionaries, to say: "People talk about the harm done by missionaries in Cho-sen. Of course they will have their defects, but I believe they are doing not a little for the benefit of Cho-sen. First of all, the people of Cho-sen, during the five hundred years of the reigning house, really

thirsted for religion and hungered for spiritual truth. The missionaries have satisfied this hunger and thirst. It must never be forgotten that to them belongs the merit of having given food to the hungry. In short, if it is asked, 'Has the work of the missionaries been successful?' it must be answered, 'Of course it has.' To have made such a record in such an immature country is a fact rare in missionary history. We regard their work as a great work and thank them for doing it."

It remains to state one effect of annexation on the misionaries' standing in Cho-sen. Under the old regime, the missionaries rose to the highest plane of influence attained by such workers anywhere in the East. One became a Minister of the United States in Seoul. Several have had easy access to princes and even to the royal family. They were approved and encouraged by the Emperor. They had the only hospitals and real schools in the realm. "They are real kings," exclaimed a Japanese official in admiration of their boundless influence over their converts. The position they have won surprised me too. They are not only superintendents and pastors, but the native pastors and evangelists, whose entire expenses are paid by the Christians, put themselves under the direction of the missionaries, never seeming to think of such a thing as independence of foreign direction.

How different from Japan! I went to Cho-sen, not on my own initiative, or that of my mission board, but on the invitation of the leaders of the Congregational Church here to visit their missionary work there. I was welcomed and invited to preach in their churches. But had the American Board sent me there to oversee the work of these Christians, I fancy every door would have been shut in my face. It is this spirit of complete independence that has been worked out in Japan by long years of experience, and even of friction, that is bound to enter Cho-sen and affect the exalted place the missionaries have gained. Every disaffected pastor and Christian who sees the Japanese churches in the same city wholly independent of missionary control is bound to become an advocate of a like independence and to try to undermine the exceptional position of the missionary.

The successful Japanese pastor has worked out, often thru years of painful struggle, his own spiritual problems, and has related them to the other problems of his country and to the age in which he lives. He is in every sense an independent thinker, drawing his spiritual life from the great source of all life and from his God-given environment. I should say that the Cho-sen pastor is of simpler type, more childlike, taking naturally and confidently and joyfully what the missionaries teach him. He has not yet worked out his own intellectual and spiritual salvation in connection with world thought. And if missionaries can tide them successfully over the perils to faith that attend every intellectual advance, they will have done even greater things than they have already accomplished.

SENDAI, JAPAN.

In an Italian Hill Town

BY RICHARD BURTON

I MISSED the uses of my mother tongue;
Afire with Beauty, yet I scarce could speak
A few, poor stammering words, hard-wrung
From lips inapt. So, thru a silent week
Of dreamful isolation wandered I,
The dumbest thing between the sod and sky.

But heaven sent me token, after while:
A wee bambino waved a chubby hand
At me, the stranger, in the open street;
Smiling, it waved; I found it very sweet,
This wordless converse; both could understand
The universal language of a smile!

UNIVERSITY OF MINNESOTA, MINNEAPOLIS.

The Federationist - II

[This is the second article in our series of "Federationist" papers. The first, published in our issue of March 23, was a preliminary survey of how far the nations have proceeded in world organization, and was entitled "The Federal Tendency." It was written by Prof. John B. Moore, of Columbia University, formerly Assistant Secretary of State. The author of the following paper prefers to sign his name "Justus." His article will be found to throw much light on "The League of Peace" idea, which has already been advocated by Mr. Carnegie, Mr. Roosevelt and others. President Taft has not yet appointed the members of the Peace Commission, as he is waiting, we understand, till he hears how far the other governments are willing to go in appointing similar commissions. —EDITOR.]

Possibilities of the United States Peace Commission

THE advocates of peace frequently prefer to go the full length of what seems desirable instead of confining their efforts to what is practical. Indeed peace societies are primarily engaged in sowing seed that is expected to bear fruit only in some future time. The Peace Commission being an official body may be expected to refrain from this line of action and to declare only for things that are both desirable and practical. Indeed, the very appointment of such a commission is a sign that the time is at hand for gathering the fruit of efforts made for peace and justice during previous decades, or even centuries. This is a time of harvest and the Peace Commissioners will need to be judges of what is *ripe* fruit as well as of what is *good* fruit, in this world-wide field of humane effort.

As it is desired to secure the assent of other governments, as well as of our own, to the recommendations made, the commission will consider not only matured public opinion in this country but in foreign lands. Questions will arise of a constitutional character, questions of principle, questions of policy, questions of expediency, military questions, naval questions, legal questions, political questions, the fundamental question always being how to achieve greater security for the vital national rights at home, such as continued possession of the national domain and the exercise of all the rights of sovereignty therein, and at the same time a greater measure of justice in international affairs, without continuing indefinitely to increase the burdens of taxation for national armaments.

For such a commission men are manifestly needed who have wide experience with the workings of the existing agencies of law and government, in all their departments, i. e., courts, congresses, armies, navies, etc. A properly constituted commission, after due deliberation, may be expected to report in favor of a League of Sovereign States, organized for the better protection of national rights, and the better administration of international justice. Such a league might be constituted by general consent to the following proposals:

1. Periodical assembling of an international congress or conference for discussion of international questions.

2. The establishment of an international court or courts, in addition to the existing tribunal of arbitration at The Hague.

3. Mutual guarantees to respect national territory and sovereignty.

4. Mutual agreements to abide by the decisions of international courts within a clearly defined area, *each* signatory Power being free to bind itself to arbitrate all or only specified classes of questions, and the international courts to exercise jurisdiction over such questions only so far as the *several* nations concerned have *mutually* authorized such action.

5. The signatory Powers to act in concert for compelling obedience to decisions rendered within the area thus marked out for international courts or tribunals, by general or special treaties.

6. Each signatory nation to maintain for this purpose a naval power proportionate, say, to its population or volume of international trade, upon an agreed basis.

7. In armed conflicts between nations inside and outside the league, each member to use its armed forces as it may de-

sire, unless the member or members concerned have proposed arbitration of the particular questions at issue (being such questions as are arbitrable among all members of the league), or unless an arbitral judgment duly rendered has been disobeyed by the outside nation. In such cases the powers of the league to support its member or members in a conflict with a non-member.

8. Each signatory nation to be free, as now, to remain neutral, or to take part in any conflict between non-signatory nations.

9. The armed forces of nations in the league never to be used for interference in domestic disturbances within the realm of any of the members, unless this shall have been previously arranged for by published agreement between the nations concerned.

As to the first proposal—an international congress. An assembly containing representatives duly chosen by all interested parties is an essential to any well organized government or system of justice. Such assemblies form an important part of all the governments evolved in modern times, and are now in process of formation for improving even the most ancient of existing governments, for instance China, Russia, Persia, Turkey. A proper system of international justice without such an assembly is an impossibility.

A permanent international congress of the American Republics is already organized, and has held four sessions. Such an assembly, containing representatives from all sovereign states, and possessing inherent power (1) to convene at convenient times, (2) to elect its own officers, and (3) to determine its own program of procedure and discussion, was proposed by the United States at the second Hague Conference. Unanimous consent could not then be secured for this radical proposition, but was given to a proposal that a third conference, similar to the second, be held at The Hague about 1915, and that a committee be organized two years earlier for considering and reporting upon the best form of organization for such a conference and upon its proper program of procedure and discussion.

It is reasonably certain that the Third Hague Conference will arrange for its successors, but to make sure of this, everything possible should be done to strengthen the existing sentiment in favor of this progressive step. The commission should therefore declare in favor of the periodical assembling of a general conference of sovereign nations, and it might be wise if recommendations are made as to the proper length of time between conferences, the best plan for their organization, etc.

Experience has shown that national assemblies had to protect themselves against the executive department of their government by a constitutional limitation of the interval between successive sessions of parliament. The international assembly has not one single executive to contend with, but forty-six. It is all the more important therefore to agree upon some principle according to which the international conferences will assemble, and with whose operation the national executives cannot interfere. Perhaps as good an arrangement as any would be to provide for a conference at stated intervals, say every seventh year, unless a postponement be agreed to by two-thirds of the nations represented in the previous conference, and that in no case shall an interval of more than nine or ten years come between successive conferences. This would seem sufficient time for maturing international public opinion regarding ideas proposed at the previous conference, and at the same time delay for an unreasonable time would be prevented.

Of course small states cannot expect to have an equal voice in the international legislature, when permanently established and endowed with its proper jurisdiction. But in the present condition of international affairs it would seem best to concede equal representation to every sovereign state.

Unquestionably discussion in international conferences should be strictly limited to international questions, and should never be permitted to invade the internal affairs of any constituent state.

For the present it would seem that each constituent state ought to have power to veto, as to its own affairs, any resolution approved by a majority. This would put national inertia on the side of

international progress and at the same time provide for harmless escape of strong national sentiment, without delaying the progress of all until the most backward are ready for the important forward move about to be made by their progressive neighbors. The time will come when a basis of representation may be agreed upon such as our Constitution contains. But that time has hardly arrived yet, and it is practically certain that sovereign nations are not now ready to have themselves bound by agreements between others to which they have not themselves assented.

A general conference of sovereign states would have the *inherent* right and power of self-government, and it would assert this right as occasion may make that desirable. It may be best, therefore, to take this for granted instead of stating the fact as was done in the American proposal at the second Hague Conference.

As regards international courts of justice. International courts would be a necessary adjunct to any league of peace or union for justice among nations. We already have one general international court, containing four judges appointed by each nation, and it has proved its utility by deciding some important cases. The United States is even now negotiating for the establishment of another, supposed to be more easily operated and more capable of rendering judicial decisions, which will in time become an authoritative and uniform body of international law.

Being without accurate information as to the success of this endeavor, it may be well to inquire, why not create a *system* of international courts, analogous to our own State or Federal judiciaries?

The judges of the existing tribunal (four for each country) might well be empowered to try disputes involving questions of private international law, or to which citizens of different nations are parties. An appeal might be allowed to a court of appeals constituted from the entire membership of this tribunal (184 persons) according to an agreed method, either by selection or elimination.

Questions between two or more nations could be similarly provided for. Perhaps for this purpose the creation of international circuits would be desirable, say an Asiatic circuit, several European circuits, and several American circuits, the grouping in circuits to be with reference not merely to geographical position but to mutual confidence of the states placed in the same circuit, as proven by existing ententes, or treaties, or by their past relations. Cases between countries in different circuits, or even in the same circuit, could come by appeal to a supreme court, established by selection of a judge from each circuit, in a given manner by general or special agreement between the interested parties. The confidence as well as the distrust arising from proximity of particular states could thus be utilized to advance the general progress of peace and justice.

Whatever the form of international courts of justice, the one thing essential to their speedy growth in usefulness is some jurisdiction, however limited, so that they can become an integral part of the world's judicial machinery, and act within their jurisdiction with the same authority as existing state and national courts do.

It seems possible to define such a jurisdiction for international courts, and this task will become much easier by the making of mutual guarantees to respect national territory and the right of sovereignty therein, as a basis for the proposed system of international justice. This proposal seems of prime importance. It might be made the *sine qua non* of participation in the proposed widening of the area of law and the corresponding narrowing of the area of war. Each state accepting this as the cornerstone of the proposed house of international justice might well be permitted to mark out the area, large or small, within which it is willing to submit its conduct to duly constituted courts or tribunals. The courts would then exercise their jurisdiction in the international affairs of all the constituent states, but in the affairs of any two or more states only so far as the states concerned shall have *expressly* and *mutually* authorized such action. International tribunals would thus acquire a jurisdiction, wide for some nations, narrow for others. Nations not willing at the time to trust their important interests to this system of justice may be ex-

pected to do this as the working of the system demonstrates its trustworthiness.

The mutual guarantee of the two *vitalest* rights of every nation—its territory and its unhampered exercise of sovereignty therein—will do much to remove the reluctance to accept obligatory arbitration of all other questions. Perhaps all questions growing out of international commerce between the signatory Powers may be found an acceptable formula to many nations, in connection with these mutual guarantees of vital national rights.

Investigation of *all* questions, with right reserved of appeal to arms *after* decision, in such questions as may not be mutually designated as suitable for obligatory arbitration, may prove to be a useful expedient.

Whatever may be thought of these particular proposals the guaranteeing of territory and sovereignty constitutes in itself a solution of the chief difficulty, and a way can certainly be found to overcome any remaining obstacles.

As to proposition 6, i. e., concerted action of the naval powers of nations in the league for compelling obedience to judicial or arbitral decrees duly rendered in accordance with express agreements by the nations concerned. Several sovereign nations having met and failed to reach an agreement, each ought to be free to do as it pleases after the conference adjourns. But even sovereign nations have no right to agree with others to do certain things or to refrain from doing certain things, and then be allowed to break this agreement with impunity. Each nation in such a conference, and assenting to the agreement made, is morally obligated (1) to demand its faithful performance, not only as respects its own immediate affairs, but as respects the affairs of any party to the common compact, and (2) to back this demand by marshaling its armed forces for securing compliance therewith. Making such an agr ement would simply place the power of the league, and of the nations in it, at the service of good faith and in opposition to bad faith, at the service of *law abiding* and in opposition to *law breaking* governments that sign the compact.

The United States could just as well sign such an agreement as the one whereby it guarantees the independence of Panama, or maintains the Monroe Doctrine. Panama's continued independence and the continued independence of all American nations have thus been adjudged by the United States as things that are right, and as things that our armed forces should perpetuate, irrespective of the views entertained on this subject by nations which may regard as improper or undesirable the continued independence of these governments.

Such an agreement on our part would prejudge that our armed forces are to be used on the side of fidelity to pledged promises, made after due deliberation, in a negotiation to which our nation was a party. True, our traditional policy is to "avoid entangling alliances." This, however, can hardly be called an "entangling" alliance. It would be, on the contrary, an effective compact for widening the area of law duly declared and adjudicated, in accordance with principles for which this nation has risked everything in the past and of which it is still the chief exponent.

Our wise policy of avoiding "entangling alliances" can be brought forward, however, in opposition to the proposal that the nations in the league use their armed forces in concert to compel nations not in the league to keep the peace. And it is not reasonable to suppose that the commission will report in favor of any such aribitrary proceeding.

As to the power which each signatory nation should supply. There are obvious reasons why any land forces needed should be supplied by the nation directly concerned. Leaving this question out of consideration, the following seems evident. As each of the allied nations is to be guaranteed in its territory and sovereignty therein, and also in the faithful compliance by all parties with arbitral agreements duly concluded, each nation should certainly supply some power for securing the general enjoyment of these benefits. The power should be proportionate to the benefits received and to the particular nation's capacity to contribute. It would seem reasonable to take as the unit of power one first class battleship and the auxiliary craft necessary to secure its greatest efficiency, properly armed and manned. It would seem rea-

sonable, with some exceptions, that each constituent nation should supply this amount of power as the representation of its sovereignty, and an equal amount of power for an agreed number of inhabitants, say for every five million, unless there are over one hundred million, and in such case for every ten or fifteen million. This would probably suffice to place an overwhelming power on the side of law and justice as against arbitrary action. Such an agreement would require some nations to increase their naval power, and it would leave all nations free to arm themselves as heavily as they desire and can find means for.

At the same time it will do away with the only *valid* reason for great armaments—the necessity of protecting in this way the nation's vital *rights* at home, and vital *interests* abroad. Consequently it would be found increasingly difficult to secure war appropriations at any capital, in excess of this requirement, unless the particular nation is menaced by special dangers which demand the possession of greater power. In such case it is right and proper that each nation provide the requisite power for its proper protection. At this moment it will probably be found that no nation is ready to leave the decision of this question to anybody but its own constituted authorities.

This very delicate and somewhat complicated problem would seem to have its solution in this simple way of requiring from each nation a reasonable contribution of armed power for enforcement of law and justice in international affairs, while permitting each to maintain such additional power as to it may seem proper. The mutual guarantee to respect territory and sovereignty would, in great measure, prevent the abuse, for purposes of aggression, of such armaments as are maintained, because the power of all the nations in the league under this arrangement, would be much greater, in all probability, than the power of any one nation, even the most heavily armed.

Small nations which cannot hope to accomplish much if anything with the naval armaments that are within their individual resources, could thus acquire, by concerted action, a power equal if not superior to that of the so called great nations, and this power would be available for protecting *each* nation in enjoyment of the national domain and sovereignty at home and for securing justice abroad, in an increasing degree.

Nations not possessed of the required naval power should be permitted to pay an agreed cash equivalent in lieu of its proportion of power, either in whole or in part. Nations having less than an agreed population might be permitted to pay an amount less than the equivalent of the power suggested above, the amount required being proportionate to population, according to an accepted standard.

Other principles may be found for determining the proper naval power to be supplied by each member of the league, for instance, the number of free citizens, meaning by this those who possess all political rights, or the volume of international commerce done by the people of the nation. Whatever principle be taken the results will show that this system, when generally accepted, will always work so as to place the preponderance of power on the side of respect for vital national rights at home and the best possible administration of justice abroad. Any nation however small, by entering into this arrangement, will be able to secure for its protection an ample naval power, and at a comparatively small cost. Priceless political privileges can be made more secure by joining this league, and by proposing arbitration in every question, as it arises, with nations inside or outside the league.

Of course such contracts may not be complied with. But human experience proves that good things promised are more likely to be done than if there were no promise to do them. Besides, each nation is perfectly free to arm itself as its dangers may seem to demand, even the danger of non-performance of this compact on the part of one or of many signatory Powers.

Repeated failure to secure a general international agreement for the limitation of national armaments is a reason for endeavoring to go forward along this way instead of in the way that has proven so difficult. A compact of this kind would certainly be easier to make and would probably be as useful as an express agreement to limit armaments.

A league founded on these principles could be constituted with safety as soon as governments will agree whose combined naval power, on the basis herein proposed, would be several times as strong as that of any one nation. The attitude of even the greatest governments toward this proposal would then be of comparatively small importance. Heretofore the opposition of any great Power was practically conclusive against any proposition. In the face of such a league, even the greatest nation would find its position untenable outside the league, from a military point of view, not to speak of moral or economic considerations.

Nations entering into the league should be free, as now, to take such action as they may individually choose, in regard to conflicts between two members, for various reasons, among which may be mentioned this—that it is impossible to prejudge such a matter. As the nonmembers have refused to unite with others on the basis of mutually guaranteeing national territory and sovereignty and international justice within certain reasonable limits, there is no principle whereby protection can be afforded them. They must be left exposed to the danger of arbitrary action by other nations in their affairs in consequence of their insistence upon the right to exercise arbitrary will in the affairs of others.

Whether any agreement be proposed regarding participation by the league or its members in conflicts between nonmembers, or between members and nonmembers, the question of domestic disturbances within the realm of members of the league would probably have to be dealt with in some way. The Constitution of the United States provides that the armed forces of the United States shall never interfere in disturbances within any State unless aid is called for by the State Legislature, or by the Governor under certain circumstances. At the same time the United States is bound by the Constitution to guarantee to each State the continued enjoyment of its existing democratic form of government. If any right of interference in domestic disturbance is conceded, the correlative duty of assisting the disturbed government when called upon for aid should also be recognized. It would seem that one thing in this respect might be proper among American governments, and another thing as between the governments of the New and of the Old World, this difference arising from the fact that all American governments are founded upon democratic principles, however diverse their success in administration, whereas most Old World governments are monarchical in form.

It might be a great stabilizer in American affairs if all American governments should agree never to interfere in domestic disturbances until called upon for assistance by the disturbed nation, and when so called upon to see that constitutional government is maintained, or speedily re-established if it has been previously impaired. As the ballot box supplies a peaceable means of correcting all actual errors in a democratic government, an agreement to prevent resort to violence for correction of alleged errors would be simply a compulsion to make proper use of the democratic principles of government. Persons who are tempted to foment revolution in American republics would be less apt to attempt such nefarious designs if they knew for a certainty that the combined power of all America would have to be met by them and their followers. And even if some leaders should dare to attempt this, after the formation of such a league, their followers would doubtless be few and their own punishment speedy and complete.

Even if such an agreement be found expedient in the near future, for conclusion between American republics in the formation of a more perfect Pan-American Union, it would seem impossible, upon principle, for the United States to make any agreement that would necessitate or permit the use of its armed forces for assisting any Old World government to suppress revolution within its domain. Why? Because all American governments are provided with excellent devices for enacting into law the present sentiment of the people, a right which had to be won from European monarchies by armed forces after a prolonged war of revolution, and one which very few European peoples enjoy even at this late day. At this very mo-

ment England is in the throes of internal tho peaceful convulsion because a hereditary upper house has the power, under the constitution, to defeat the will of the people's chosen representatives, duly declared in the House of Commons. Yet England is one of the best European governments.

The United States has recently acquired some distant possessions, but it would violate our fundamental principles and our declared policy to continually hold such possessions in subjection. Various Old World governments have a settled policy to the contrary. England, for example, holds India and other populous places in subjection, and expects to continue this policy indefinitely, tho India alone has several times as many people as all the self-governing parts of the British Empire, including the colonies as well as the British Isles themselves.

[Since this article was written the revolution in Portugal has taken place, converting that ancient monarchy into a republic and separating church and state after a union of centuries. No international complications have thus far resulted.—EDITOR.]

Wars of revolution may come within governments thus constituted, to throw off, as Americans did a century ago, the alleged right of particular persons to rule by inheritance, whether thru human or divine law, or to separate Church and State, or to free subject peoples from the authority imposed upon them without their consent, or for other purposes. Wars between nations may come in consequence of such revolutions.

Participation in such conflicts would be contrary to our general policy, steadfastly adhered to during more than a century. We would not assist in France's struggle for the overthrow of royalty, tho the French people had aided us much in our fight for political rights which we declared to be an inalienable possession of all peoples and which were considered impossible of valuation, even in terms of men sacrificed for their recovery or defense, not to speak of money or other material values. On principle the United States cannot make any agreement that would compel us to be a party to any such wars on the side of any monarchical government.

Whatever the form of the league, provision would have to be made for withdrawing from it upon due notice; and, of course, breach of the compact would justify if it did not necessitate the exclusion of the faithless member.

Besides securing guarantees of territory and sovereignty, the proposals herein suggested would gain for all signatory Powers:

1. An improved method for defining the rules or principles of law to be observed by nations in their mutual intercourse.

2. A good way to ascertain when, in fact, these recognized principles have been violated and by whom; and

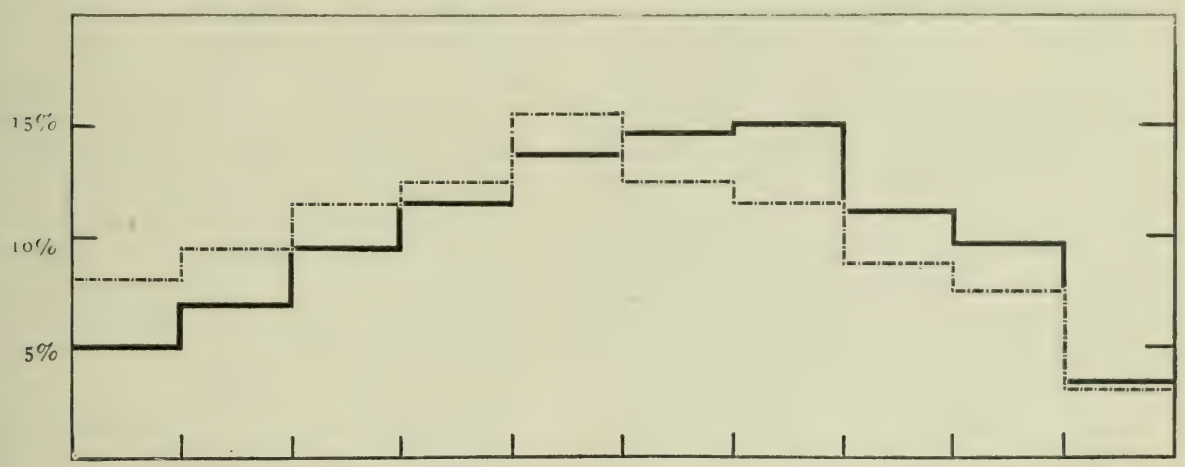
3. As good a way as now seems practicable for redressing the injuries thus occasioned.

A League for Peace and Justice so formed would be far from what the world has a right to desire and to demand, but there is a long time between now and the millennium, in which reason, growing good will and experience with international arbitration will cooperate to improve continually the imperfect union that would thus come into beneficent action. The very greatness of the work and of the benefits to be derived from doing it well would make the Latin proverb extremely appropriate, *festina lente*. A league which possesses a deliberative, a judicial and an executive department, however imperfectly formed, may be expected to grow fast enough in favor and in power and in usefulness.

JUSTUS.

Grading Professors

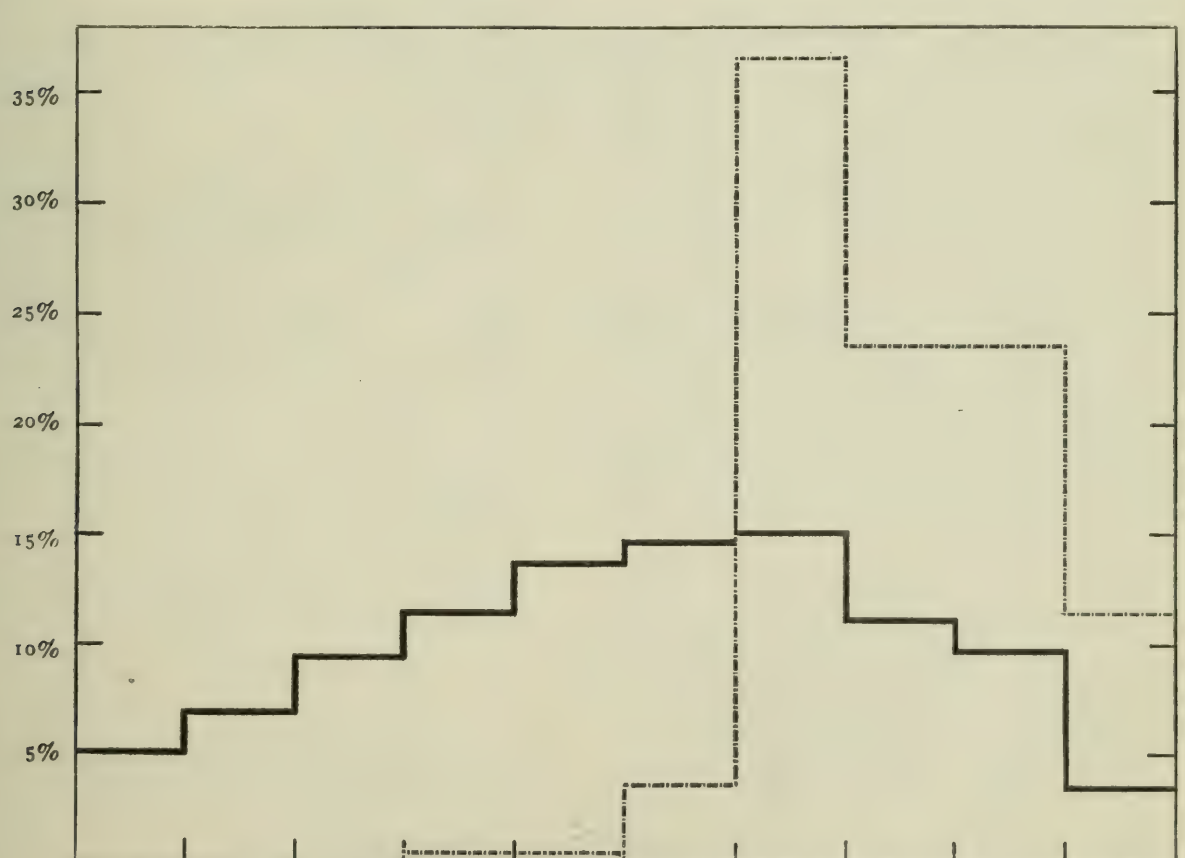
BY EDWIN E. SLOSSON, Ph.D.



STUDENTS have often complained of the one-sidedness of the arrangement by which the professors put on record every term their opinion of the students while the students never had an opportunity to give their opinion of the professors, never officially, at least. Perhaps they will feel better about it now that it is being demonstrated that the arrangement has really worked the other way all the time. The figures filed in the registrar's office do not always tell much about the character of the student's work, but they always tell something about the character of the instructor. This is only a specific instance of the general rule that whenever we undertake to criticize other people we always criticize ourselves.

Such self-betrayal or portrayal is, however, usually unconscious, so it has come as a surprise to some professors to learn by a simple mathematical demonstration that they had been all these years recording their own grades along with those of his classes. Tables and diagrams showing personal eccentricities in marking have been drawn in several institutions lately, but usually for the purpose of reforming the system. The value of such data for the student who wants to get thru college on the smallest possible expenditure of mental exertion has not been given much attention.

Thru the kindness of a member of the Board of Trustees, I have been furnished with a series of curves prepared by the Registrar, Mr. Alfred S. Goodale, showing the grades given in Amherst College last year, and two of them are reproduced herewith. In both diagrams the average distribution of all the grades given in the college for the year is indicated by the solid line. The averages of two departments selected as examples are indicated by the dotted lines. We can see at a glance what a difference it makes to a student which of these studies he elects if he is ambitious of high marks, as some students are for one reason or another, or if he is short of time, as all students are for one reason or another. If he enters Department II he has ninety-nine chances out of a hundred of getting C+ or above. If he enters Department I he has only forty-three chances of getting so high a grade. A set of charts like these compiled for each instructor for a series of years would be an invaluable asset to any fraternity house and would greatly reduce the terminal mortality. It would be as much in demand as the quiz compends now sold or loaned for the purpose of forecasting examination questions. Students would no longer have to depend upon hearsay evidence as to an instructor's leniency or severity, but could calculate their chances of passing by the law of probabilities with the assurance of an actuary. The fault of students is that they do not make practical use of the mathematics they get in the classroom. It is safe to say that by the use of these curves the amount of study required to get a sheepskin or a key that will not wind any watch might be reduced to a quarter or a fifth of the average expenditure, provided the elective system allowed the students to take full advantage of this information. Of course, a newly appointed instructor would be baffling at first, but they would soon catch on to his curves, or could procure them thru some inter-collegiate exchange from the college where he formerly taught.



In *Popular Science Monthly* for April, 1911, President Foster, of Reed College, gives figures and curves for several universities, tho not in sufficient detail to satisfy the requirements of the indolent student. In Harvard, for example, the chances of getting an A in elementary courses range from thirty-five in a hundred in Greek to one in English. In the intermediate courses they range from 60 per cent. in Greek to 2 per cent. in Fine Arts. In the University of California 37 per cent. of the students in Military Education get the highest grade and 2 per cent. of those in Music; while

the lowest grade is given to 17 per cent. of the students in Physics and in Mathematics and to none in Irrigation and Education. Missouri was the first of the large universities to adopt a scientific system of marking, and in most departments now the distribution of grades is sufficiently close to the theoretical curve. The extreme variation from it is History of Art, where 15 per cent. of the students obtained A, while at the other end of the list are Military Education, Geology, Zoölogy and Civil Engineering, with the nearly normal ratio of 2 per cent. of A. The Missouri rule is a simple one: half the class get Grade C, and a quarter of the class Grades A and B, and the other quarter Grades D and E.

Grades	E	E+	D	D+	C	C+	B	B+	A	A+
College	6.0	6.8	9.0	11.3	13.8	14.4	14.8	10.8	9.3	3.4%
Department I.	8.0	9 6	11.4	12.4	14.6	12.8	11.8	8.6	7.6	3.0%

DIAGRAM I. The heavy line shows the distribution of grades in Amherst College, 1909-10. The dotted line the distribution of grades in one of the departments.

Grades	E	E+	D	D+	C	C+	B	B+	A	A+
College	6.0	6.8	9.0	11.3	13.8	14.4	14.8	10.8	9.3	3.4%
Department II..	0	0	0	5	.5	3.5	36.7	23.6	23.6	11.6%

DIAGRAM II. The heavy line shows the distribution of grades in Amherst College, 1909-10. The dotted line shows the distribution of grades in another department.

Theoretically, college credits should show the chance distribution like physical measurements and ability tests; for example, like the distribution of shots on a target, guesses at the number of beans in a bag, hights of men in the street, and tests of memory. The curve plotted from any such figures resembles the cross-section of the sand pile in an hour glass. If five grades are used the percentage frequently would be:

E	D	C	B	A
3	22	50	22	3

But college students are a picked class, cut off from the general heap of young people by the straight line of the entrance examination, so President Foster holds that the curve of distribution of grades should not be symmetrical but skewed to the left. The corresponding percentages would then be:

E	D	C	B	A
6	24	50	18	2
	30		20	

Or, to allow for fluctuation in the ability of the classes in different years, the following elastic classification may be used:

E	D	C	B	A
0-10	20-28	45-55	15-21	0-6%

In the University of Missouri for the first year under the new rule the distribution of 11,342 grades was:

E	D	C	B	A
9.0	14.5	50.0	21.7	4.9
	23.5		26.6	

This shows that in spite of the rule the Missouri faculty have a leaning to the side of mercy.

At Harvard, when the question was first studied, the average frequency of grades in eight large elementary classes was found to be:

E	D	C	B	A
9	18.5	44	21	5.5%

This is sufficiently close to the theoretical frequency to show that the chance law applies, but taking the courses one by one showed wide deviations:

E	D	C	B	A
0-20	0-31	27-62	6-39	7-20%

Since no classes of fewer than eighty students were included this proved that the personal equation had too great an influence. Accordingly each instructor was furnished with a diagram, similar to those prepared at Amherst, showing his own curve in comparison with that of general average.

Returning now to the Amherst graphs we can see that the general grading of the college is much more just than appears at first sight. The fault lies in the attempt to use too fine a subdivision. Five grades are better than ten. The instructors cannot distinguish between a C and a C+ student, but they can and obviously do distinguish between a B and a B+. There is an evident tendency to force up the grades which results in the skewing of the graph, making the right side of it steep and irregular. In the long run, however, this fails of effect because the ranking is inevitably comparative. If we redistribute these ten grades into five as follows:

E	[E+,D,D+]	[C,C+,B]	[B+,A]	A+
6	27	43	21	3%

we see that they really follow the law of distribution quite satisfactorily, better, in fact, than the Harvard graph, for Harvard piles up on both ends of the line, giving too many very high and very low marks. If the Amherst instructors would transfer to the middle group, which should include 50%, about half of those they now mark D+ and abolish fictitious discriminations, they would hit it about right.

Let us now consider the case of the professor who has outlined his character in Diagram I. He appears to be somewhat more severe in his judgments or higher in his expectations than the majority of his colleagues, but he is obviously a conscientious and fair-minded man. The reason why his graph deviates from that of the college is chiefly because he has transposed it to a lower key. He has a different scheme of ranking in mind but he applies it consistently, as appears when his grades are grouped in the following way:

E	[E+,D]	[D+,C,C+,B]	[B+A]	A+
8	21	52	16	3%

His gradings, tho not exactly comparable with those of other departments, are self-consistent and as well distributed.

The professor in charge of Department II is apparently of a very different type. His graph shows such a wide deviation from the theoretical or the college average that it is useless to try

to bring it into harmony with either. Evidently some strong influence is at work to give it such a pronounced skew to the right. We may suppose that he is a teacher of such exceptional powers that is able to stimulate all his students to supernormal activity, or that he is so clear in his expositions as to make the stupidest understand, or that his subject, his personality, or his reputation is such as to attract only students of remarkable ability. Other explanations, perhaps equally plausible, will readily occur to the reader.

It must not be supposed, however, that he holds the American record for high marks. The class of a professor who, until recently, was in the Columbia faculty, scored 100 per cent. of A grades in their last examination. This establishes a record that other universities are not likely soon to beat.

The law of chance distribution which, according to mathematical psychologists, is also the law of even-handed justice, can be properly applied only to large numbers. A small class in any one year may show a wide deviation from it. But thru a series of years the marks given by any instructor should approximate it. The prevalent tendency to give more high grades in the later part of the college course has very little justification, for requirements are supposed to advance with the years. It should also make no difference with the distribution of grades where the line of failure falls. There is no object in using the hundred scale unless for convenience of calculation, for the only thing that can be attained by grading is the ranking of the body of students with reference to their median line of ability or proficiency. A simple, uniform and scientific scale is what is needed.

Hell's Resurrection

BY HARRY KEMP

THE saffron-colored stars of Hell
Diminished one by one;
Their lusters into grayness fell—
The New Age had begun;

And Satan's yellow gonfalons
Like baleful meteors broke
(Above his seething myrmidons)
Thru heaving bulks of smoke,

As at the Gates of Bliss they clung
In this last hopeless war,
Ere Hell sloped down the void, far-flung,
Like some dismembered star.

At that same moment every rose
Forsook its spikèd thorn;
The North put warmth into its snows,
Nor pushed with boreal horn;

The spider laddered patterns wove
Across the cannon's mouth,
And frankincense and myrrh and clove
Breathed each wind full of South;

The serpent-sinuous wiles of Sin
Assailed the sense no more,
And wine, with bubbling demons in,
To snare the soul forbore.

Mankind was first to cry complaint:
Art lost all hues but white;
Song found no subject but the saint
And dropped its wings ere flight.

There grew no need for Book and Bell,
And churches tumbled in;
From her high honor Virtue fell,
For GOD had vanquished Sin.

A sadness touched e'en Heaven, then,
And shadows of despair;
No worship mounted up from men,—
And angels live on prayer—

"Ah, bring back Sin!" The Seraphim
In mystic cadence cried.
"Ah, once more make our sunshine dim
With Death!" Creation sighed.

So Death and Sin took up their way
Among mankind once more,
And Hell burst into dreadful day
As it had flamed of yore!

The Washington Place Fire

BY ROSEY SAFRAN

[This article was obtained by a representative of THE INDEPENDENT, who interviewed Miss Safran shortly after the disastrous fire in Washington place, New York City, March 25, 1911. An investigation by the Grand Jury has followed, and last week Isaac Harris and Max Blanck, owners of the Triangle Waist Company, were indicted for manslaughter in the first and second degrees, the maximum penalties being twenty and ten years' imprisonment, respectively. The partners are now under $25,000 bail.—EDITOR.]

I, WITH a number of other girls, was in the dressing room on the eighth floor of the Asch Building, in Washington place, at 4.40 o'clock on the afternoon of Saturday, March 25, when I heard somebody cry "Fire!" I left everything and ran for the door on the Washington place side. The door was locked and immediately there was a great jam of girls before it. The fire was on the other side, driving us away from the only door that the bosses had left open for us to use in going in or out. They had the doors locked all the time for fear that some of the girls might steal something. At the one open door there was always a watchman who could see if any one carried out a bundle or if there was a suspicious lump in any one's clothing.

The fire had started on our floor and quick as I had been in getting to the Washington place door the flames were already blazing fiercely and spreading fast. If we couldn't get out we would all be roasted alive. The locked door that blocked us was half of wood; the upper half was thick glass. Some girls were screaming, some were beating the door with their fists, some were trying to tear it open. There were seven hundred of us girls employed by the Triangle Waist Company, which had three floors, the eighth, ninth and tenth, in the Asch Building. On our floor alone were two hundred and thirty. Most of us were crazy with fear and there was great confusion. Some one broke out the glass part of the door with something hard and heavy—I suppose the head of a machine—and I climbed or was pulled thru the broken glass and ran downstairs to the sixth floor, where some one took me down to the street.

I got out to the street and watched the upper floors burning, and the girls hanging by their hands and then dropping as the fire reached up to them. There they were dead on the sidewalk. It was an awful, awful sight, especially to me who had so many friends among the girls and young men who were being roasted alive or dashed to death. I can't describe how I felt as I stood there watching. I could see the figures, but not the faces—the police kept us all too far back. We hoped that the fire nets would save some, but they were no good for persons falling so far. One girl broke thru the thick glass in the sidewalk and fell down into a cellar. That shows with what force they came down from the ninth floor.

One girl jumped from the ninth floor and her clothing caught on a hook that stuck out from the wall on the eighth. The fire burned thru her clothing and she fell to the sidewalk and was killed. Another girl fell from the eighth to the sixth floor, when a hook supporting a sign caught her clothes and held her. She smashed the window of the sixth floor with her fist and got in the shop and went down to the street, saving herself. One of my friends, Annie Rosen, was an examiner on the ninth floor. She was near a window when the cry of fire was raised. She tried to open the window to get out. It stuck, but she got it open and climbed on a little fire escape. The fire was coming up from the eighth floor and in getting from the ninth to the eighth her hat and her hair were burned. She doesn't know how she got to the eighth; maybe she fell. She was going to jump to the ground, but the people who were watching her from the street shouted not to do it, and somehow she got thru the flames. She fell from the eighth to the sixth floor on the fire escape and then she was carried down to the street and taken to Bellevue Hos-

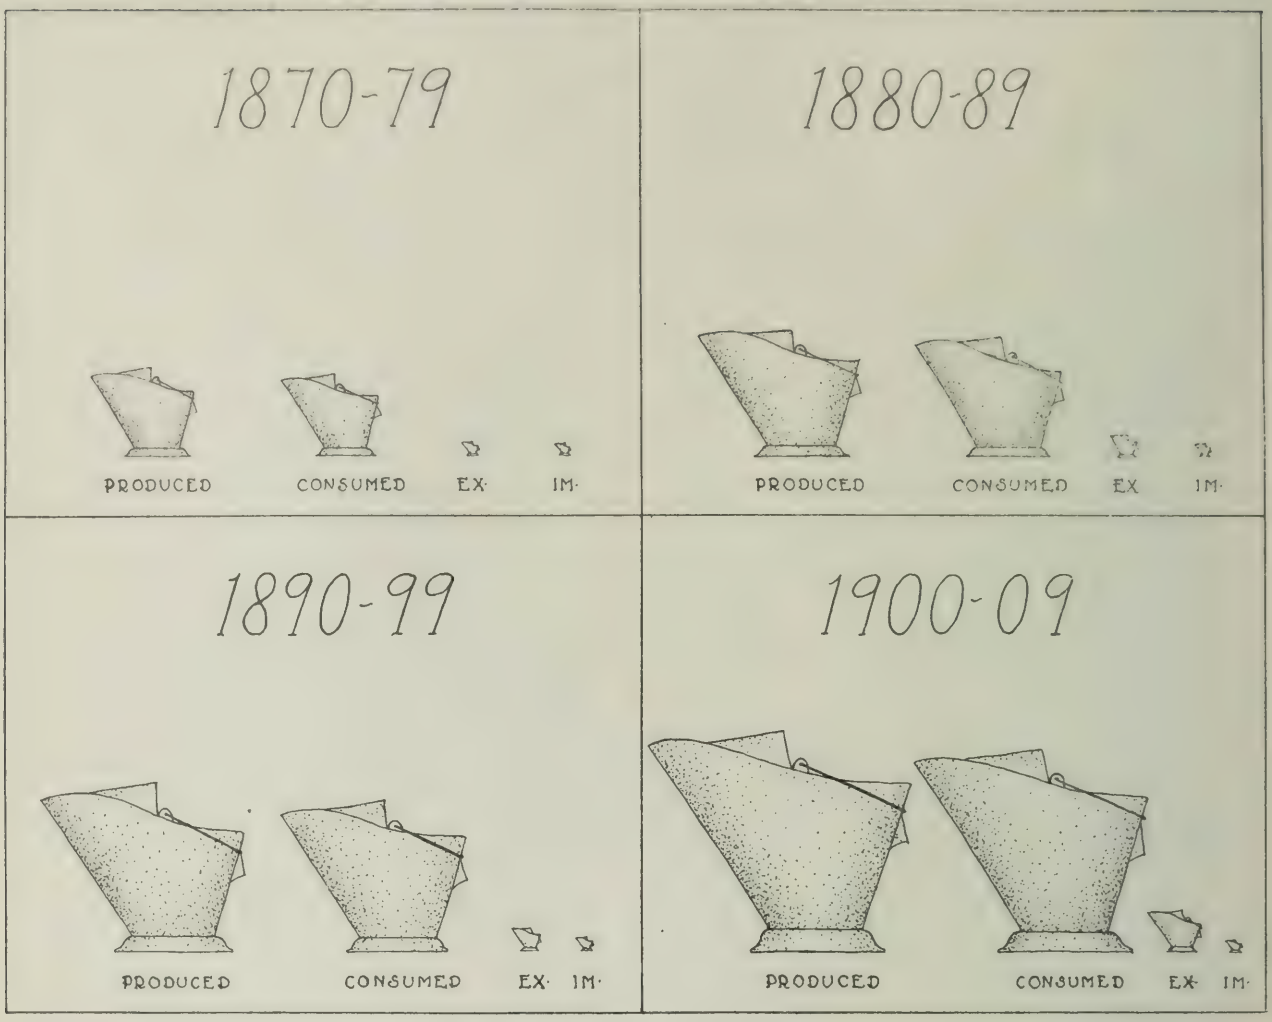
pital, where there were many of her companions. She is out now, but pale as a ghost; she does not think that she will ever be strong again. She has lost her nerve and is afraid all the time.

I was on the street with other girls watching. We were screaming for about twenty minutes and then some one took me home. I don't know who it was. Afterward I went to the Morgue and saw my friends there, Ida Jacobowski, Rosey Sorkin, Bennie Sklawer, Jacob Klein, Sam Lehrer and others. It was on the ninth floor that there was the great loss of life. Altogether 145 were killed and of these 120 belonged on the ninth floor. When firemen broke open the door on the Washington place side they found fifty bodies piled up there. I, who worked on the eighth floor, was unhurt, except for the shock, and will go to work again at the same business as soon as I can get a job in a fireproof factory.

I was in the great shirtwaist strike that lasted thirteen weeks. I was one of the pickets and was arrested and fined several times. The union paid my fines. Our bosses won and we went back to the Triangle Waist Company as an open shop having nothing to do with the union. But we strikers who were taken back stayed in the union, for it is our friend. If the union had had its way we would have been safe in spite of the fire, for two of the union's demands were, adequate fire escapes on factory buildings and open doors giving free access from factories to the street. The bosses defeated us and we didn't get the open doors or the large fire escapes, and so our friends are dead and relatives are tearing their hair.

In persuading us to go back to work after the strike the bosses showed us how easy it was to make good wages on the scale they offered. The waist styles then were simple, with little trimming. So we did make good wages at first. Then the styles changed to more complicated designing and more trimming, with the scale the same. We couldn't make so many of the shirt waists and so we didn't earn so much money. Our hours were from 7.30 in the morning till 6 in the evening, but we could work overtime if we liked and also could work on Sundays—making seven days' work a week. There was no extra pay for this overtime work. The bosses wanted us to do it when there was a rush of business, but they would not pay any higher rate. Generally, overtime is paid for at a higher rate. I averaged about $14 a week. I worked overtime at that. Sometimes I made $18 a week. That is the most earned by the smartest girl and that means working from 7.30 in the morning till 9 o'clock at night and Sundays too.

I learned to operate a machine in Chlebowice, Galicia, Austria, where I was born. Chlebowice is a little country village. I came to this country three years ago, and for the last two and a half years till the date of the fire I worked for the Triangle Waist Company. The wages were not so bad, tho many of the girls only made $6 and $8 a week, but they should have had some regard for our lives.



NEW YORK CITY.

The National Coal Bin

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

IN 1814, 20 tons of coal were mined in the United States. By 1820 the amount had increased to over 3,000 tons; in 1830 to 286,000 tons. By 1840 the production had reached nearly 2,000,000 tons, and in 1850 was over 6,000,000. From this time the increase has been rapid and continuous. In 1883 production passed the 100,000,000 mark, in 1899 it was over 200,000,000, in 1903 over 300,000,000, and in 1907 exceeded 400,000,000 tons.

In 1870 Great Britain produced over half of the world's supply of coal, while the United States and Germany each furnished a trifle over 15 per cent., leaving 17 per cent. for the production of the rest of the world. In 1902 Germany furnished about the same percentage of the world's supply as in 1870; Great Britain's proportion had decreased to less than 30 per cent., while the United States furnished more than one-third of the world's production. In 1870 England had produced more than the United States and Germany combined, while our country was third in rank. In 1902 the United States was easily in the lead, with Great Britain and Germany following.

Tho the average individual, with his mind on kitchen range and household furnace, thinks of anthracite when coal is mentioned, our yearly production of bituminous quadruples that of anthracite.

The production and consumption of coal in this country are probably more nearly equal than is the case with the production and consumption of any other of the great staples. Only about 3 per cent. of the product of our coal mines is at present exported, and during the last few years this proportion has remained fairly constant while the ratio of imports to our consumption has steadily decreased.

New Haven, Conn.

Reform in Mexico

BY AN AMERICAN ENGINEER

[The gentleman who contributes the following returned last week to New York from the heart of the insurrection in Mexico. He has resided in Mexico for the last four years. As he has large business connections in Mexico he prefers not to sign his name.—EDITOR.]

I BELIEVE that the Mexican insurrection will be successful. This does not necessarily mean, however, the deposition of President Porfirio Diaz. Diaz will agree to grant what the revolutionists require, and they will accept his promise and subside. Diaz realizes the need of reform and understands the general sympathy that the intelligent Mexicans feel with the reformers. Ninety per cent. of the Mexicans sympathize with the revolutionists, tho only about 10 per cent. are willing to fight. They want a bloodless revolution. The probabilities are that they will secure one.

Grafting and oppression by the Governors of States and *jefe politicos* of districts are the chief causes of the widespread discontent. The *jefe politicos* are somewhat similar to our sheriffs, but have more power. Grafting is very general and takes a different form from the grafting in our cities. The Government officials assess the corporations that do business in Mexico just as some of our legislators assess corporations. A company that wants to do business in Mexico will find it to its interest to present a block of its stock free to the proper officials. That form of grafting is sufficiently familiar to us. But lower down in the scale there is a difference. Our police graft from criminals, prostitutes, saloonkeepers and gamblers. The Governors and *jefe politicos* in Mexico graft from the common people.

Suppose, for instance, that a peon has saved up $250 and the *jefe politico* of the district hears about it. He arrests the man, making any charge he sees fit. He does not need any evidence. The peon's family raises all the money that they can get and come to the place where their relative is imprisoned. When the *jefe politico* has drained them of all possible cash he releases the unfortunate peon. Under the present system the victims have no redress. Appeals and petitions to higher authority do no good.

It is believed that Diaz himself does not graft from the poor, but he must know what the minor officials are doing. He appoints the Governors. Mexicans tell me that the small salaries of the officials fairly force them to make money dishonestly. Good and capable men will not take the places. Consequently, as matters now stand, they go to men who are not good, who go into office poor and in a short time are rich, having made their money by oppressing the best and most industrious citizens. There is no good excuse for the small salaries paid to officials. I am informed that a Governor only receives $500 a month. Mexico can afford to pay liberal salaries if her taxes are honestly administered. Taxes are relatively very high, but, as I understand it, three-fourths of the money realized by them sticks to the hands of officials while on the way to the treasury.

Most of the American mining companies in Mexico pay salaries to the government officials of their localities on one pretext or another. It is a good way of keeping out of difficulties. Experience has proved that if this is not done, local officials will find some way of making trouble. Our company never made such payments, and our *jefe politico* made more or less trouble for us, tho the chief victim was a Mexican. We needed lime for smelting and were in the habit of purchasing it from a neighboring Mexican who owned a lime quarry to which he had held the title for thirty years. The *jefe politico* of our district come over to our town and reconnoitered. He found the owner of the quarry making a fairly good thing out of sales to us, and soon after sent him a court order to come to a place that we would call the "county seat." When the quarryman appeared in response to the

order he was arrested. A little later he was released, and the *jefe politico* owned the quarry. How he got it I do not know, but he got it. We had been buying the lime for $6 a ton, but the official raised the price to $8. We could have bought elsewhere, but did not think it wise to pursue that course. So he got at our pockets in that roundabout way.

That was a mild instance. Some of the officials are so notoriously corrupt and oppressive that they get all their neighbors down on them, and then have to run away in order to escape assassination. At the same time there are some of the Governors and *jefe politicos* who are honest men who do their best to serve the people over whom they rule.

The revolutionists want new and better men in office, the Governors of States elected by the people, and the abolition of *jefe politicos*. Diaz seems to be wide awake to the situation and doing all in his power to purify officialdom. The old Cabinet has gone and many of the Governors of States have been changed.

The attitude and action of the President have had a quieting effect. If he goes on as he has begun it will content the revolutionists and they will cease their disturbance. Mexico has had thirty years of peace now, and those who really want war are very few.

Americans in Mexico thought that the massing of our troops on the border was a very foolish move. I do not know whether or not the present revolution is engineered from the United States, and I have not talked with any one who pretends to such knowledge, but ever since Mexico has been a republic the Mexican has had in the back of his mind fear of annexation to the United States. The massing of the troops might easily have caused more trouble than any good Mexican or American desires to see. The crossing of the Rio Grande by any of our soldiers might easily be the signal for attacks on such of the Americans as the Mexican Government could not afford special protection. As it was, the Mexicans remained calm in face of what had at least some appearance of being a threat, and the Mexican newspapers editorially advised the people to accept President Taft's assurance that nothing unfriendly to Mexico was intended. So up to the present no evil has come from the massing of troops.

The papers were pacific, probably because they were acting under orders. There is no free press in Mexico, and it is probably better so. Latins and semi-Latins are much more easily inflamed than Anglo-Saxons, and a really free press might cause numerous and serious popular explosions. Mexicans whom I knew well would not even talk about our troops on the border.

Mexicans do not hate the Monroe Doctrine. They do not think about it. They do, however, resent any talk of annexation, and they resent the attitude of some Americans who assume superiority and flaunt spreadeagleism. These call Mexicans "Greasers" and look on them with contempt founded on ignorance. Very poorly indeed do such Americans compare with the cultured and sometimes brilliant men of that nation, who can fluently speak four or five languages and who have attended the best schools and colleges, perhaps in our own country. Great numbers of Mexicans go to California for education. Others go to Europe.

Well-behaved Americans who remember that Mexico is a great country which has demonstrated its ability to stand alone and govern itself get along well in Mexico and find it a pleasant land. They do not expect or wish everything to be as it is in the United States. The people are different in race, traditions, ambitions, manners and viewpoint. Those Americans who are wise accept the differences, remember that they are in Mexico and try to acquire the Mexican way of doing and looking at things. The people are courteous and polite to Americans and like them well. We have about $800,000,000 invested in the country and have done much to develop mines, railroads and industries. Were it not for the arrogance of a few Americans we would be even better liked—as well as are the Germans and English, who set a good example of accepting conditions in Mexico as they find them and making no invidious comparisons. These latter nations are making great progress in Mexico, and I think much of their business success there is due to their courtesy and

the respect which they pay to Mexican prejudices.

There are three principal races in Mexico—Indians, Spaniards and mixed—but they do not desire to be considered as Indians or Spaniards, much less as half breeds. That last name is offensive to them. All announce that they are Mexicans and proud of it. Those whom I speak of as Spaniards are of Spanish blood but born in Mexico. There is no racial inequality, as here. All are intensely patriotic, are proud of Mexico's past and filled with the hope and belief that her future is to be glorious.

The less any one on this side of the line has to say about annexation the better for Americans and American interests in Mexico. It would be the worst kind of mismating, the geniuses of the two peoples are so unalike. The ease with which French and English Canadians get along is not a fair parallel. The United States and Mexico can be good neighbors, but union between them would be a calamity. Mexicans want their own way in their own country, and tho it is not our way, who can blame them? At times the thought intrudes that some day their powerful neighbor will come after the remainder of the land that was left to Mexico at the end of the war sixty-five years ago. The fate of our Indians and treatment of negroes are object lessons not disregarded on the other side of the Rio Grande. Mexicans like us—in our place. But the fear that some day we may attempt to assimilate them—more or less benevolently—is most disturbing, and we should be careful not to excite it.

I like Mexico. It is a wonderful country, beautiful, and of immense undeveloped resources. We boast of the winter climate of Florida and California, and compared with the New England climate they are admirable. But as far superior as they are to New England, just so far is Mexico superior to them. There is no rain at all thru the winter in Mexico City—sunshine every day and the air mild and balmy. Mexico City is rather high above sea level, which some find a drawback, but Cuernavaca, four hours' ride from Mexico City, is just perfection. The world is only beginning to know about Mexico. Soon travelers will stream there. Americans who have lived in the country for many years love it and look upon it as their home.

There is a charming and cultured society in Mexico, just as we have in our American cities, and about as exclusive. Americans are admitted on their merits and find it very enjoyable.

The peon, of course, is very poor; a five-dollar bill looks like a lot of money to him, and if he manages to save $25 he may excite the cupidity of any official who learns about the hoard. Still, there are mitigations of his lot. The exceptional peon, by shrewdness, industry and economy, can rise, can even rise to any place in the Mexican Government.

The bull fight seems to be losing in popularity in Mexico. Only the announcement of exceptionally fine bulls now fills seats around the arena. The Mexicans are taking to sports, and baseball is becoming very popular. There is no gambling in the country other than the Government lottery, which, I believe, is square. There is no trouble between Church and State. All the Mexicans are Roman Catholics, but the priests are not allowed to meddle with the Government. Church and State have their separate and complementary fields, in which they stay.

The big, new, progressive things with which Mexico is busy are irrigation and road building. She needs wagon roads badly, as all freight outside of the cities has had to be carried on mule back on account of the lack of good roads. Now those good roads are being made fit not only for wagons, but for automobiles. This will undoubtedly have the effect of attracting rich tourists and will soon make Mexico an ideal country for automobiling. Irrigation is being done on an immense scale, and will add very largely to the rich agricultural area. Americans of late have acquired coffee and sugar plantations and are doing well. So it is safe to expect a great increase of American investments.

There has been in the press here gross exaggeration of the troubles in Mexico. Armies and battles figuring in the dispatches have been about three-fourths imaginary. There is a disturbance and

good cause for disturbance, for Mexicans generally are determined to end the intolerable grafting and oppression from which they are suffering—and they will end it. They want to make the change with no bloodshed or as little bloodshed as possible.

Now is the time for us to show ourselves good neighbors, which is not to be done by sitting on the fence in the attitude of a vulture watching a battlefield in expectation of plunder.

There are many friendly things that we can do for our good friend Mexico at this time, and we should do them with a thoro good will.

NEW YORK CITY.

The Unswept Halls of the Montezumas

BY J. W. LEE

PLINY mentions a celebrated work of Sosos of Pergamos—the "Unswept Hall." This was a pavement of inlaid work, representing the crumbs and fragments left on the floor after a banquet. It was only another name for a famous mosaic. It differed from the mosaics of other artists, in that it was without harmony. Crumbs and fragments would lie on the floor, after a banquet, without reference to any sort of order. All that is meant then by the "Unswept Halls of the Montezumas" is, a Mexican mosaic, a mosaic without order.

As to its surface Mexico is a mosaic. The Sierra Madres, which connect the Rocky Mountains with the Cordilleras of Central America, lie upon the elevated plains of Mexico, as if they might have been the crumbs and fragments left from some banquet of the Titans. They are now split into numberless peaks, standing out in the dim distance, like sentinels appointed to their posts, from the foundations of the world. There they come together and command the plain for miles around. They are single and they are double. They are in rows and they are out of order. They are in platoons and regiments. They are square and they are round. They are pinnacled and they are flat. They stand, they lie, they roll, they lean back, they come forward. They are blue, they are gray, they are black, they are brown. They look solemn, they look jocular. They jut square up from the earth, they rise by gradual ascent. They welcome you, they defy you. They elicit your admiration, they remind you of your littleness. Now friendly enough to bid you abide in their presence, now lonely and forbidding enough to make you dread the accident that would keep you in their sight one single hour. They seem to be the symbols which nature used in her attempt to utter some awful and great message to man. They speak directly to the soul, and while in a language no one can translate, yet a language, one must be without a soul not to understand. They constitute the literature of some primal time, and speak in prose, poetry, comedy and tragedy. In the esteem of most people Switzerland has had a monopoly of the sublime in mountain scenery. Mont Blanc, the Jungfrau and the Matterhorn have been the acknowledge leaders of the world's peaks. But when the tide of travel turns toward the Tropic of Cancer, and some poet does for the Sierra Madres what Sir Walter Scott did for the Scotch lakes, the chief place as to mountain scenery will pass from Switzerland to Mexico.

The climate of Mexico is a mosaic. Between the snow on Orizaba and the bananas in the plantations of Vera Cruz there is a range of weather as wide as that between Siberia and Southern Italy. What Mexico lacks of having all zones by her location on the globe, she pushes her Popocatepetl, her Ixtaccihuatl, and her Xinantecatl 18,000 feet into the sky and gains by her altitude.

The flowers of Mexico constitute a mosaic. The varieties peculiar to her hot

lands, her temperate lands, and her cold lands, deep, rich, and intense in color, exhaust all the hues of the prismatic scale. They glow like stars in the sky. They lie upon the meadows, reach down the deep gorges, and run up the mountain sides, illuminating plain, and ravine, and crag with the brilliant colors of the rainbow. By a little use of the imagination the calla lilies, the camelias, the poppies and the ten thousand specimens which make up the unrivaled flora of this sunny land may be regarded as covering the earth in accordance with the order of the chromatic scale, and to move from every side of one in octaves, illustrating as they go all the tints the light can make. Standing upon some of the mountains about Orizaba, overlooking the tropical forests of the surrounding country, we get a vision which comes in response to the play of the trillion-fold fingers of the sun as they strike the notes lodged in the blue, the scarlet, the crimson of these flowers, which, once having seen, one can never forget. It is the music of color, too subtle and refined for the ear, but rising in symphonies, silent and radiant, to regale the imagination thru the eye.

The birds make up another mosaic. They lend enchantment to slope and grove and field. In plumage and song the birds of Mexico are entitled to the first place. In song they lead the world's choral union among the feathered singers, who from their throats pour streams of melody thru the corridors of God's first temples. In plumage, according to Señor Don Antonio Garcia Cubas, the fifty varieties of humming birds, alone, form a chromatic scale of brilliant tints, running from sea-green, thru bluish-green, to emerald-green, and from the lightest straw color to the deepest scarlet and fiery red.

Here, too, is a marvelous combination and mixture of races, Toltec, Aztec, Spaniard, pure and mixt.

The language these races speak is a mosaic. The rugged strength and picturesque structure of the Aztec, set off as the mountains do the plains, the soft, sunny flow of the Spanish, while all this is now and then dashed with streaks of straight Anglo-Saxon.

The States of the republic make up another mosaic. They vary in the character of their soil, the quality of their mines, the color of their flowers, the plumage of their birds and in the nature of their scenery.

A particular State because of its position above sea level, and because of the special qualities of its mines, its woods, its soil, finds it easy to develop a partial monopoly of some line of business. Queretaro has a corner on the beauty which flames in her opals, and provokes the industry of her people to supply them to the markets of the world. Pueblo hangs her hopes for fortune upon the onyx, which her people make into ornaments that they may secure the money of the unsuspecting tourist. Aguas Calientes is an agricultural center, and lives by supplying the country with corn and beans. Chihuahua raises horses and cattle. Oaxaca teems with its splendid harvests of indigo and cochineal. Tamaulipas offers luxuriant fields for the herdsman and the shepherd. Zacatecas and Guanajuato are famous for the enormous amount of silver contained in their mines. Vera Cruz is studded with an endless variety of useful and ornamental timber. So, of all the rest, each is noted for some particular capacity of soil or mine.

The history of Mexico is a mosaic. It partakes of the manifold diversity of the surface, products, races and language of the country. Looking back to its history since 1821, we see Emperors, Presidents, Dictators, Provisional Governors, Regents, and Ad Interims rising and falling, coming in and going out, thus weaving a piece of historic patchwork such as the eyes of men never saw in any other country. It is historically stated that from 1821 to 1863 there were seventy-five executives, an average of almost two a year. Revolution has been the national game of Mexico. Hidalgo, Iturbide, Pedraza, Bustamente, Santa Anna, Comonfort, Zuloago, Miramon, Maximilian, Juarez and Diaz have in turn engaged in the play, along with other notable Mexicans.

The greatest man ever produced in the Western Hemisphere south of the United States was Don Benito Juarez. The affection which the Mexican people cherish for his memory can be under-

stood in some degree, when it is stated that at the last anniversary of his death $60,000 worth of flowers were hung around his tomb. They were made in France of porcelain and metal, and imported, one single wreath costing $3,000.

When Maximilian landed in Mexico in 1864 he sent a letter to Juarez and other Republican leaders asking for a conference, hoping, he said, thereby to see if all parties could not be induced to come to peaceful terms with the new Empire. Juarez replied, that he could not consent to such a conference, and in closing a long letter, which is one of the most remarkable documents ever written, he said: "In the course of history it is sometimes permitted men to invade the domain, violate the constitutional rights, and take the property of a people powerless to resist. But there is one thing from which there is no possible escape, that is the everlasting verdict of history. It will judge us." It has judged them already. The Maximilian pageant has well nigh faded from our view, but Juarez grows in influence and the respect of the world. The distinguished Spanish orator, Emilio Castelar, said of Juarez in 1864, while the Maximilian Empire was in its glory, and while Juarez was hiding with a few of his faithful followers in the desert plains of the northern part of the country:

"Heroism in prosperity is beautiful, but in adversity it is sublime.

"The men who rise against the whole world are the great men of history. Conquered and abandoned of America, cursed by a theocracy that desires at any cost to preserve its perishing goods, handed over to a foreigner by a group of traitors, the sword of the first empire of Europe pressed against his forehead, Juarez, the representative of a fallen race, the chief of a people without hope, did not abandon his place. Serene and inflexible he rose amid the ruins surrounding him, as the sacred personification of the republic. If Washington ennobled the cradle of one republic, Juarez sanctified the sepulcher of another. And from the sepulcher thus sanctified, it will be resurrected strong and eternal."

The last order ever signed by Maximilian was for 2,000 nightingales with which to stock the groves of Chapultepec.

Atlanta, Ga.

The Wander-Call

BY EDITH M. THOMAS

It was my joy to wander—
  Heaven bade my foot be free,
That I might forth, and follow
  The Voices calling me:
A calling of the desert,
  A calling of the sea,
A calling of the Genius
  Where men in cities be!

The wander-winds they bore me,
  By ways unknown—or known,
Thru Morning-lands a rover—
  In starlit icèd zone—
Across the Condor mountains—
  By austral islands lone:
The seasons rolled unheeded;
  The years were past me blown!

And Time, and Term, and Distance—
  Of these I reck no more!
Beside the River Ocean
  Lies many a friendly shore;
And music-languaged cities
  Make murmur, to my door!
They cluster—wilds primeval—
  And pageant lands of yore!

It is with me as ever—
  The wander-call is clear;
And I must forth and follow,
  But now, Earth's Far is near! . . .
A Voice from out the Trackless
  Comes ever to my ear—
A calling, calling, calling,
  Outside this dwindled sphere!

New Brighton, N. Y.

LITERATURE

American Government

BEFORE his election to the first Duma, Mr. M. Ostrogorski had attained distinction as the author of "Democracy and the Organization of Political Parties." More recently he has visited the New World. He now publishes an essay of almost 500 pages, based upon the second volume of the work cited, but including much new matter.[1]

Mr. Ostrogorski's examination of our extra-constitutional machinery is, in many particulars, less soberly conservative than the chapters devoted to the same subject in the second volume of Mr. Bryce's classic "American Commonwealth."[2] Even the author himself would scarcely pretend to Mr. Bryce's fulness of understanding where peculiarly American institutions are concerned, tho he doubtless would contend that he has put his knowledge of the subject to a more telling application. Certainly his work is more controversial. Yet the more recent critic of our institutions fails to convince any one acquainted with the workings out of "minority representation" (as in Pennsylvania) that the principle involved is, practically speaking, efficacious; even tho he strives to disarm attack in writing: "More perfect systems [than those used in Pennsylvania and Illinois] have been adopted in several European countries." Safer, on the whole, are the hackneyed suggestions that the Presidential term be lengthened and re-election prohibited, and that members of the Cabinet "be given free access to both Houses of Congress and to their committees, to furnish information and to advocate the Administration measures." But while it is not impossible to accept (academically) these reforms, the utopian plan for evolving certain "associate Senators" is as wild as it is impracticable.

As heirs of the British Constitution, we have been wont to accept as a necessary and not unmixt evil that form of party government—for the most part two-party government—which has prepared the election business for us beforehand, enabling citizens to perform their duty in an automatic way; and thus keeping the government machine steadily in motion. By the view of M. Ostrogorski, our greatest problem today consists "in discarding the use of permanent parties with power as their aim, and in restoring and reserving to party its essential character of a combination of citizens formed specially for a particular political issue." Certainly there are present indications of precisely this tendency. Definite suggestions as to furthering this same tendency are to be found in these scattered sentences:

> "Contrary to current prejudice, the election principle in government is a spring of limited power; once the limit is exceeded, it becomes, like a strained mechanical spring, incapable of supplying the required impulse. . . . By parceling out, so to speak, public functions of every kind on the election method, the people fritter away their authority instead of increasing it."
>
> "The first and greatest reform in the election system is the curtailment of the system itself, the reduction of the number of elective offices to a minimum. . . . All the administrative offices in the State government, as in the local and municipal government, ought to be filled by appointment."

Within certain limits *Democracy and the Party System* is entitled to high praise. It is the work of a foreigner, but of this we are seldom reminded by

[1] DEMOCRACY AND THE PARTY SYSTEM IN THE UNITED STATES. A Study in Extra-Constitutional Government. *By M. Ostrogorski.* New York: The Macmillan Co. $1.75 net.

[2] A new revised edition of this work, in two volumes, has just been issued by The Macmillan Company, $4. The British Ambassador has brought his book down to date so effectively that it now includes even the figures of the late census. New chapters treat of the latest phases of the immigration question, the negro question etc. Many of the chapters have been left unaltered; thus in the discussion of our foreign policy reasons are offered to show the improbability of our ever seeking territorial expansion, while a supplementary chapter discusses the American dependencies. The worth of this really indispensable work, whose youth is now in part renewed, is too great and two well known to require discussion.

such a slip as a reference to Columbia "College" for University (p. 225), or the use of the adjective "popular" for populous (p. 227), or by faulty syntax (p. 187). Mr. Ostrogorski is, to be sure, too daring in his generalizations to achieve perfect accuracy. In characterizing "the boss" (and he has just been speaking of the State boss) he boldly avers that this individual "cannot speak or write English correctly," and suggests that "he has hardly attended the primary school." Yet the dictator of Pennsylvania is a Harvard graduate, and had the advantage of meeting Theodore Roosevelt in the classroom; M. S. Quay was the son of a clergyman and left a considerable library behind him; the late Senator Platt was a Yale man, as Mr. Barnes, of Albany, is a graduate of the rival institution. Mr. Ostrogorski's book is however, thoroly modern in its instances, is clear in exposition, and in its narrative chapters has the liveliest degree of interest.

The Campaign of Chancellorsville. By John Bigelow, Jr. With maps and plans. New Haven: Yale University Press. $10.

Major John Bigelow, Jr.'s, strategic and tactical study of the Chancellorsville campaign is a voluminous work, comprehensive in scope and thoro and impartial in manner. In spite of the amazing amount of detail given, the narrative and descriptive parts are strikingly vivid. It is a book which is likely to remain the definitive account of that confused and incoherent battle. Hooker's unopposed passage of the Rappahannock and march to the rear of Lee's army at Chancellorsville is usually classed, as the author says, among the most brilliant maneuvers of military history. But from then on everything moved by haphazard until the army retired, baffled and beaten. Sedgwick, fifteen miles away, was at first consigned to inaction; and when at last ordered to move was unable, even by the brilliant feat of capturing St. Marye's Heights, to give decisive aid to the main army. Howard, with his right "up in the air," was surprised by Stonewall Jackson and utterly routed. Sickles was driven back, Sedgwick was left to take care of himself, and Hooker, dazed by an injury and by a responsibility too great for his capacity, entirely failed to move and fight his splendid force as a united army. A good deal of new light is thrown on the rout of the Eleventh Corps. The responsibility for the disaster is plainly laid to Howard. The German and German-American troops of that command ever afterward bore the reproach of cowardice; but it is the author's opinion that the disaster would have happened to any body of men placed as was that body. Repeated warnings to Howard of the presence of the enemy had been ignored by him; his flanks were unprotected, and the inevitable happened. But even without the rout of the Eleventh Corps a victory for the Northern army was improbable. Hooker's irresolution was evident thruout the campaign. One of the bravest and most efficient corps commanders, he was lacking in the qualities of an army commander. To General Doubleday, some months afterward, he said: "Doubleday, I was not hurt by a shell and I was not drunk. For once I lost confidence in Hooker, and that is all there is to it." The lack of self-confidence may have been incident to the battle; it was certainly not manifested in his boastful proclamations and conversations before the event. But irresolution, resulting in conflicting orders and faulty arrangements, characterized his conduct thruout the campaign. The author believes that no greater mistake was made than Hooker's recrossing of the Rappahannock. Lee was about to attack him on his own ground. His troops greatly outnumbered Lee's; they were well placed and well supported by artillery, and had Hooker remained and had Lee attacked on the morning of the 6th, the Confederate army might have been destroyed.

Cowboy Songs and Other Frontier Ballads. Collected and edited by John A. Lomax. New York: Sturgis & Walton. $1.50.

Frontier Ballads. By Joseph Mills Hanson. With Pictures in Color and Other Drawings by Maynard Dixon. Chicago: A. C. McClurg & Co.

Professor Lomax, of the University of Texas, has for some years been collecting the naïve poetry of our South and Southwest. In his work he has had the co-operation of Professors Kittredge and Wendell, of Harvard. In a volume

of more than 300 pages, a volume which the editor frankly avows he means to be popular, Professor Lomax issues the first published result of his long labors. A very few of the ballads, as that of "The Buena Vista Battlefield," for example, have a certain conventionality and relative degree of polish that seem to disqualify them for such a collection as this: or would have disqualified had the choice been made along strict lines. Yet even this conventionality is accounted for when the collector explains that he has brought together the best lines out of the variants before him, and that he has "Jonahed" some of the profanity and other marks of crude vigor which we look for in such verse. Other of the ballads have scant value or interest for the student, at least, inasmuch as they seem to be mere plagiarisms of such popular songs of yesteryear as "My Bonnie Lies Over the Ocean" ("The Cowboy's Dream"), or "Dolly Gray" ("Mustang Gray"). There is, however, real melody and feeling in the best and more original of Professor Lomax's collection. The lament of "The Poor Lonesome Cowboy," for example, is certainly touching, with the refrain:

I'm a poor lonesome cowboy,
I'm a poor lonesome cowboy,
I'm a poor lonesome cowboy,
A long ways from home.

In many cases the music as well as the words of these frontier songs are painstakingly reproduced. It must be confessed that, with "The Old Man Under the Hill," the song of the incorrigible Confederate, "I'm a Good Old Rebel," has the best movement of any in the volume. And that fact shows the catholicity of Professor Lomax's anthology, which, whatever its poetic value (emphasis is to be placed on other considerations), must interest a great variety of readers. His work has been academic in no narrow sense of the term, and was work eminently worth doing. It has an historical value, moreover, that is quite wanting in the original and vigorous out-door verse of Joseph Mills Hanson, whose creed it is that

"The silent sea and plain, the mountain, wood, and down,
Are better haunts for the feet of men than the streets of the roaring town."

Yet the roughness of Mr. Hanson's *Frontier Ballads* is, after all, like the rudeness of the *Cowboy Songs* in corresponding to the theme itself.

Klaus Hinrich Baas. By Gustav Frenssen. New York: The Macmillan Co. $1.50.

The story of a Hamburg merchant, of peasant stock, self made, from the time he started in as stable boy, is the theme of Pastor Frenssen's latest novel. Unlike "Jörn Uhl" and "Hilligenlei," it is in no way a religious book. There is a struggle toward self-development and self-realization, but not in the sense of a soul finding itself in God, as in the earlier novels. It is more a masterful personality asserting itself against the untoward surroundings of poverty, toil and social neglect. Not that the boy's hard-worked mother is neglectful; she follows him to the Spielbudenplatz and, in front of the music hall he is about to enter, boxes his ears soundly and sends him home. At several points in his subsequent history, altho he, too, works hard and succeeds in becoming a man of distinction in business Hamburg, it would have been better for him if the mother had boxed his ears again! This story of a pleasant and forceful young man comes at a time when France is making a hero of a forceful and unpleasant young man, Jean-Christophe, by Rolland. There is an occasional touch of similarity between Klaus and Jean-Christophe, but the German hand is heavier, and the characterization of a genius in finance lacks the intense temperamental crises of a musical prodigy. Some of Klaus's adventures are gross and show the deterioration of German fiction when one recalls the stern morality of Auerbach's "On the Heights," of Freytag's "Debit and Credit," that admirable study of merchant life, and of many other old, clean novels now less read than they should be. But Gustav Frenssen is less offensive than others, and there is, in his work, a groping after justice and honesty, if not a very high sex morality. The salt North Sea flavor of many descriptive passages is fresh and invigorating, and the crowding characters are drawn with a sure hand.

History of the Syrian Nation and the Old Evangelical Apostolic Church of the East. By Prof. George David Malech, of Urmia, Persia, and after his death edited by his son, the Rev. Nestorius George Malech, archdeacon. 8vo, pp. xxi, 449. Minneapolis, Minn.: Augsburg Publishing House. $2.50

This is an unusual volume, written in modern Syriac and translated into English. The author, with members of his family, started for this country for the purpose of publishing it in English, but died on the way, and his son took up the pious duty, and has secured its translation, with large additions and with many illustrations. The father was one of the preachers and teachers connected with the American mission among the Nestorians, and the son has connected himself with the old Nestorian Church, as aided by the English Archbishops' Mission, but refused to be turned over to the Russian Church when the Archbishops' Mission made that attempt. This work gives the history of this old Syrian Church, beginning with the Babylonian and Assyrian empires, and following along to the present time. It is not critical and it is very miscellaneous, but it gives a valuable account of what the Syriac literature accessible to the author has to say as to the history of the people and the Church, which is not easy to be found elsewhere. There is a great deal in it about Nestorius George Malech, who is in this country and wishes thru this book to gain friends and aid for the Church at home.

Against the Current. Simple Chapters from a Complex Life. By Edward A Steiner, Author of "On the Trail of the Immigrant," etc. New York: Fleming H. Revell Co. $1.25.

These autobiographical sketches and interpretations from the pen of Professor Steiner are of unusual value in both their literary and sociological interest. His is the story of heroic struggle against and fortunately out of the limiting, oppressive and brutalizing environment of race prejudice and antagonism into the large liberty of human brotherhood. The journey from his Jewish home in the Carpathians, where every religious celebration was a signal for racial strife and bloodshed, to the professorship of Applied Christianity in an American college and a position of leadership in efforts for social betterment and assimilation among the conglomerate races of his adopted country, has not been made without poignant suffering and great victories. Such glowing, pathetic chapters as "Abraham Lincoln in Hungary," "An Unwilling Jew" and "The Cup of Elijah" make strong appeal against the folly and injustice of much of our race prejudice and call forth our sympathy for those who still must suffer from its destroying influences.

Literary Notes

....In this tercentenary year of the King James version let us not fail to remark those works which by the fact of that anniversary command a special interest:

The Authorized Version of the Bible and Its Influence, by Albert S. Cook (Putnam); *The Chart Bible,* by James R. Kaye (Revell); *The Authorized Version of the Holy Bible,* a photographic reproduction of the Black Letter Edition of 1611, with introduction by A. W. Pollard (Frowde); *The Authorized Reprint of the Holy Bible,* a reprint in roman type of the editio princeps, with introduction by A. W. Pollard (Frowde).

....Readers who have been bothered to find a certain verse or story among the scattered works of Kipling will be glad to know that they can get for five cents postage a *Kipling Index,* issued by his American publishers, Doubleday, Page & Co., N. Y.

....The story of a ram, *Silverwold,* is one of the more recent additions to our shelf of animal fiction. The author, Emily Jenkinson, knows the upland parish which is the stage of her rural romance—for *Silverwold* is not all ram. Her story is distinguished by simplicity and by sincerity (Baker & Taylor; $1.50).

....Jeanette A. Marks writes her second little book about Wales in *The End of a Song* (Houghton Mifflin Co., $1.15). Village life—children, motherless yet mothered—Shon Roberts's stinginess; these be some of the ingredients. Miss Marks has literary skill, and that kind of naturalness which is the highest order of sophistication.

....Una Nixon Hopkins's *Winter Romance in Poppy Land* (Badger; $1.25) is a story of tourists in California. It is an unambitious winter romance, when all is said, and as harmless as sugar candy. The decorations reproduced from pencil sketches are much more appropriate illustrations than those from harsh photographs.

....Socrates Potter is the hero of Irving Bacheller's little story, *Keeping Up With Lizzie,* and he makes a specialty of "deeds, titles and epigrams." We really hope that his deeds are better than his epigrams, and he somehow gives one the feeling that such is the case. He reflects, likewise, on the high cost of living. Mr. Bacheller's book contains a great deal of applied common sense. (Harpers; $1.)

....Tho nothing of the sort is indicated, we assume that the volume called by Professor Albert Bushnell Hart *The Obvious Orient* is the gathering up and recasting of his letters to the Boston *Transcript,* on the occasion of his recent sabbatical year. The volume is not remarkably diverting, nor does it lay claim to depth, tho it is more or less statistical. (Appleton; $1.50.)

....Paul Bourget has been lecturing on Théophile Gautier and expressing pity for him as a struggling journalist. As the overworked art critic and dramatic critic of *La Presse,* his average earnings at "space rates" amounted to about $1,300 a year. His attitude toward literature consequently became cynical. "Masterpieces!" he once exclaimed; "I do not recognize masterpieces. I recognize nothing but copy at so much the line."

....President Butler, of Columbia, contributes a eulogistic foreword to *A Little Fifer's War Diary,* published by C. W. Bardeen, the Fifer himself (Syracuse, N. Y.). Mr. Bardeen was thirteen when Sumter was fired on, and his war experience came to him as a member of company D, 1st Massachusetts Volunteers. His book constitutes an interesting and valuable document.

....Warwick Deeping's newest novel, *The Lame Englishman,* has an Italian scene and an historical background. It is the war of liberation which furnishes the necessary bloodshed and carnage. There is less of the sugary sweetness and lingering languor (one falls naturally into alliteration, in writing about Mr. Deeping) than one is accustomed to look for in this novelist (Cassell; $1.20).

....Jeanne d'Arc seems to be an inexhaustible subject for book making. Mary Rogers Bangs's account of *The Maid of France* (Houghton; $1.25) is, however, not a controversial biography, but a straightforward narrative of the Maid's stirring life, well calculated to give the reader sufficient information to attack intelligently the controversy itself. For the young, it must prove an understandable account of one of the most appealing, as well as baffling, of historic heroines.

....It was a happy thought that inspired the directors of the Bible School of the Mount Morris Baptist Church to arrange a course of lectures on the different religions ancient and modern and their relations to each other. These lectures, now published under the title of *The Unity of Religions* (Crowell; $2), are popular in character, but as each one is written by a competent scholar and student of the subject presented, the information is reliable and the views expressed are broad and tolerant. The book will serve the average reader as an excellent introduction to the study of comparative religion from the Christian point of view.

....D. Appleton & Co. are the publishing agents of the University of Pennsylvania, and from them we receive a substantial *History of the New England Fisheries,* with maps, by Raymond McFarland, Assistant Professor in Middlebury College. The learned historian includes among his appendixes the full text of the Award of the Tribunal of Arbitration, September 7, 1910, upon the North Atlantic Fisheries Question.

....Susan E. Tracy's *Studies in Invalid Occupation: A Manual for Nurses and Attendants* comes to us from Whitcomb & Barrows, Boston publishers ($1.50). There is an introduction by Dr. Daniel H. Fuller and a chapter by Dr. E. Stanley Abbot on "The Clouded Mind." As a substitute for drugging, or in any case as an adjunct, these physicians and the author of the *Studies* would, above all, urge self-help; the wholesome interest afforded by suitable occupation.

....Helen Reimensnyder Martin, the social historian of German Pennsylvania, writes in *When Half-Gods Go* a "novel by letters" (Century; $1). All the letters are written by a gradually disillusioned wife, whose husband has the redoutable "a. t." (artistic temperament). One would call it a human triangle drama in non-dramatic form—only there is a husband's brother (and successor) who squares the family circle—or did we say triangle? Mrs. Martin makes the most of her material.

....The rage for anthologies is unabated. The latest evidence is a volume, *The Garland of Childhood,* plucked from the garden of English belles lettres by Percy Withers (Holt; $1.50). From Deker to Louise Chandler Moulton, via William Blake, the Coleridges, Wordsworth, Lamb, and R. L. S., lies Mr. Withers's route. Among living poets represented are Padraic Colum, Mrs. Meynell, W. B. Yeats (the Irish regiment), St. John Lucas, Austin Dobson, T. Watts-Dunton, Katherine Tynan Hinkson and Edmund Gosse.

....Although Prof. George A. Barton, of Bryn Mawr, has devoted his energy mainly to the study of Semitics, he has not neglected other fields, as his clear historical sketch of the vital elements in Christianity plainly shows.

The Heart of the Christian Message (West, Newman & Co., London) is made up from a course of lectures delivered before the Friends' Summer School in 1908, and this accounts for the fact that special prominence is given to the Quaker movement. The book has large horizons and reveals a keen sense of religious values.

....Edward Dwelly, a native of Kent, has, after thirty years of perseverance, nearly finished the first "complete" Gaelic dictionary. His work is to fill three volumes of over 80,000 words; he has also set, stereotyped, printed and illustrated it unassisted, and is to publish it as well. Educated as an engineer, the lexicographer became a bank clerk. From being interested in old Celtic music, he developed an interest in Celtic poems and ballads. He started upon his compilation of material for a dictionary only after saving £1,200 from his salary as clerk. Publishers discouraged his venture, and he resolved to carry it out himself. He is reading his final proof now, and is the worthy recipient of a civil list pension of £50.

....*Behind the World and Beyond,* the title of Dr. Henry A. Stimson's book, is suggested by its opening chapter: "What Lies Behind This Puzzling World?" The author of these twenty-five addresses is the well-known pastor of the Manhattan Congregational Church of New York; a church which has done gallant social and political service thru its Sunday evening meetings, where the topics of the hour have been discussed by leading men of the city during the past year. The pastor is a fearless worker for civic reform, for honest and enlightened government; and yet there is no bitterness in his outspoken advocacy of the best men and measures. His published addresses are eminently sane, practical and full of a deep spirituality. (Eaton & Mains, $1.25.)

....The Bishop of Chester has published for the benefit of "candidates for the ministry and other readers" *An Excerpt from Reliquiæ Baxtertianæ* (Longmans, Green & Co.), which he properly designates as "Baxter's Self-Review." Baxter's "Narrative" is so sane and tolerable, and this portion in particular so full of wise suggestion and calm self-criticism, that few writings are better calculated to serve the Bishop's main purpose than the selection here presented. The "Self-Review" is accompanied by Sir James Stephen's essay on Baxter, somewhat abridged from "Essays on Ecclesiastical Biography," and the introduction, a goodly number of notes and the appendices supply much useful and explanatory information. It is a book to keep by one to be used as a tonic or sedative according to the reader's need.

Pebbles

LADY CUSTOMER—Do you keep coffee in the bean?

New Clerk—Upstairs, madam; this is the ground floor.—*Princeton Tiger.*

"WHAT'S the hardest thing about roller skating when you're learning?" asked a hesitating young man of the instructor at a rink.

"The floor," answered the attendant.—*Youth's Companion.*

WOES OF AN EDITOR.

"A man who owns eighty acres of land and has brains enough to till it, makes the lot of country newspaper men look like the last sad remnants of a Dutch lunch. The farmer has the best of it all around. He is as independent as an express company. He doesn't have to write a soulful obituary over some peak-headed bloke who kept on display an exhibit of cut plug profanity that would make the efforts of a steamboat mate sound like a meeting of the Epworth League. He doesn't have to go into raptures over the beauty of an open-faced bride with a cast of countenance that would blow out the gas. The farmer isn't required to lie until his back teeth fall out about the sterling manhood of a groom with ears like a cauliflower plant and the brain power of a shoat. He doesn't have to run a piano contest for the most beautiful young lady in the community, make everybody sore about the winner, and then print a 75-cent half-tone of the beauty that looks like a tintype of grandma at the age of thirteen. There is nothing in the farmer's curriculum that obliges him to paint the local soprano as a heaven-sent songster. He isn't called upon to paint the virtues of a prominent citizen who earned his money by collecting notes with a draw shave. The farmer can express his opinion of the new Methodist preacher in a firm and loud voice, on the four corners, and if the printer ventures to express the view that the preacher ought to be chasing a currycomb over a milch cow instead of filling a large room with thin ozone and misinformation, he will lose subscribers so fast that he won't have the circulation of a cold storage egg. The farmer doesn't have to impress a chaste kiss on the moist nose of his foreman in order to keep him from getting drunk on press day, neither does he have to get somebody to go on his note when the 'devil' carelessly feeds a pair of pipe tongs thru the cylinder press or the rats chew off the lining of a new set of rollers. If the editor takes two days off in fishing his patrons call him a loafer and take their job work to the other office. If he works until he is bowed over like a fat man with cramps people say he is too stingy to hire extra help. If he contributes $2 to the Woman's Christian Temperance Union and wears a boiled shirt on Sunday the banks call in his note; and if he refuses to dig up for the Woman's Relief Corps supper he is branded as a miser and avoided as if he had the hives."—*Wilson County Citizen.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Danger Line

THE events of the last week have justified completely the action of President Taft in sending twenty thousand men to patrol and protect the Mexican border. Do our readers remember how many speakers and writers, how many journals, savagely criticized the President; said he was provoking a war, was making an occasion for invading the soil of a friendly country, and was preparing the way for the robbery of half the Mexican territory? It was a criminal act, they told us, for they could only imagine an evil motive, just as they used to abuse President McKinley for his occupation and retention of the Philippines; and just as they were sure that our intervention in Cuba was meant to grab the Pearl of the Antilles. Why cannot some people as easily imagine a good as a bad motive? We approved the patrol, and only criticized the unnecessary pretense of a war-play.

Well, this week it was a very lucky thing that the army was patrolling the Arizonian border. The insurrection reached the dividing line. The opposing forces fought close to the border, in the effort of the insurrectionists to take possession of a border town on the railroad, so that they might safely gather munitions and supplies. The bullets rattled against buildings in American territory, two Americans were killed and half a dozen wounded on American soil by bullets meant for the enemy, so contiguous were the fighters in Mexico and the onlookers and residents in Arizona. More than this, loyal Federal soldiers, some forty in number, fled for protection over the line, and were disarmed by our cavalry. If our soldiers had not been there the "patriots" would have followed, and we should have had the two sides fighting within our territory, much to the danger and damage of our citizens. More than all this, when the disarmed Mexican officer would direct his soldiers left behind to surrender to the insurrectionist force, a captain in our American army actually went over into the Mexican territory and carried the message, and when they would not surrender to their Mexican foes they surrendered to him, the American, and he took them over disarmed to our side the line and turned over their arms to the insurrectionist leader. And he did right. He protected our territory and in a tactful way stopped the fighting until a new Federal force should come to reoccupy the town. Very fortunate it was that we had the soldiers on the spot.

We put absolute faith in the repeated declaration of our Government that it has no covetous designs on Mexican territory. We do not expect that one of our soldiers will cross the line, except as Captain Ganjot did, on an errand of peace and mercy. But there is a multitude of our citizens in Texas that would delight in another Mexican war and in the seizure of another big section of Mexican territory. We need soldiers on the danger line not merely to prevent invasion of our territory by one fighting party or the other, but to prevent our own citizens from organizing expeditions to aid the insurrection. So far from being a menace to Mexico, the presence of our force on the border is a protection to the integrity of Mexican territory and Mexican independence. Our Government protests to Mexico and will see to it that the offense is not repeated.

We do not doubt that the whole of Northern Mexico sympathizes with the insurrection. This it is which gives it strength and assures for it a rather hopeful outlook. President Diaz did very well for a rule of twenty or thirty years, but it is time that he stepped down from the Presidential chair. To continue his dictatorship for a term of six years longer, with all its corruption and all its oppressive taxation, is more than the people can patiently stand. But this is business for Mexico and not for us. We have no present right to intervene, and we can anticipate no occasion which will require it. We have no doubt that it would be better for these Mexican States and better for us if they could be annexed; but that must not be thought of. The days of war for territorial expansion ought to be past. More territory is good, but national honor is better. Our country may be a benevolent friend, but must never be a rapacious robber. Armies have in past days gone to rob. We fear we did it in the Mexican War; we did not do it in the Spanish War, altho colonial possessions came to us, with unlooked for responsibility which we are meeting fairly well. The presence of soldiers on the Mexican frontier is not a menace, we say, but is the pledge that invasions from either side will not be permitted, and that the intermeddlers who wish to involve us in complications which would require intervention and occupation of territory will not be allowed to disturb the relations of peace.

Proposed Tariff Changes

HARMONIOUSLY and promptly the Democrats of the House have taken up their legislative program. Following the decisions of their caucus, a Canadian Reciprocity bill and another, greatly enlarging the tariff free list, were introduced on the 12th. The next day saw the Reciprocity bill reported from committee, and the resolution providing for direct election of Senators passed by a vote of 297 to 15, with every Democrat counted for it. On the 14th the bill requiring publicity for campaign funds before elections was taken up and passed, by unanimous vote, and, as we write, it is expected that the Reciprocity bill will be sent to the Senate within a short time. This bill is a copy of the Republican bill passed at the recent session (221 to 92), with an addition authorizing and requesting the President to extend the scope of the agreement by further negotiation. The Democrats wisely decided to make it the first of their tariff measures and to let it stand alone. In their caucus there were only 29 votes for attaching tariff bills to it. Action upon the new Free List bill will follow the House's approval of the reciprocity agreement, and then the duties on wool, woolens and cotton goods are to be revised.

In framing their Farmers' Free List bill, the Democrats have sought to satisfy agriculturists who complain that the agreement with Canada deprives them of protection without giving compensation in lower duties on the goods they must buy. This complaint has led certain Republican insurgent Senators to insist upon one-sided free-list amendments to the Reciprocity bill, amendments which would invite demands from Europe for similar concessions and probably would kill the agreement. The extension of the free list now proposed meets the demands of these insurgent Senators, who will now have an opportunity to vote, in the interest of their agricultural constituents, for a removal of the duties imposed on a long list of products not only when these products are imported from Canada but also when they come from any other part of the outside world. It promises to gain support for reciprocity in the Senate. At the same time it tends to commend the Democratic party to the public.

It places on the free list all agricultural implements, bagging for cotton bales, burlaps, gunny cloth, jute bags, steel or iron ties for cotton bales, leather, boots and shoes, harnesses, saddlery, barbed fence wire, wire rods, beef, veal, mutton, lamb, pork, fresh or preserved meats of all kinds, bacon, ham, lard, sausages, buckwheat flour, corn meal, wheat flour, rye flour, bran, oatmeal, rolled oats, all prepared cereal foods, biscuits, bread, round or hewed timber, sawed boards or planks, shingles, laths, fencing posts, sewing machines and salt.

With respect to many of these products, the protectionist can offer no good

excuse for a duty. They are exported in great quantities and sold all over the world in open competition with the similar products of other lands. For example, our imports of agricultural implements last year were less than $200,000, while our exports, as shown below, exceeded $28,000,000:

	Exports
Plows and cultivators	$6,239,468
Mowers and reapers	11,281,719
All other agricultural implements	10,602,848
	$28,124,035

Sales of these implements were made in Great Britain, France, Germany ($1,563,383), Russia ($5,199,954), Australia ($1,191,998), Argentina ($6,292,238), British Africa ($886,163), and many other countries. It is absurd to impose a duty for the protection of those who manufacture them here. But we cannot see that the removal of the duty will seriously affect prices in our market. Our imports of sewing machines are, of course, a negligible quantity; but our exports last year were $7,513,852. Why should there be a duty on such machines? Duties on grain and grain products are ineffective, as a rule. Our exports of wheat flour last year were $47,621,407, while the imports were only $681,944. Duties on such flour, corn meal, bread, etc., are merely formal, so far as protection is concerned. As we exported last year $2,040,314 of prepared cereal food, the free list should have no terrors for those who produce such food here. Against exports of lard, $43,301,156; bacon, $18,381,050, and hams, $17,837,375, the imports, of course, were little or nothing.

Why should our manufacturers of boots and shoes, who sold $12,408,575 worth abroad last year, fear the loss of their tariff duty? If they can meet and overcome the foreign manufacturer in his own country, after paying transportation charges, can they not defy him here in their home market, where the transportation cost is transferred to him? We did import $7,607,932 worth of leather last year, but our exports ($37,414,175) were nearly five times as much. So in the lumber trade we bought from abroad $19,332,768 worth of boards and planks, but we exported $37,282,072 worth.

Revision of the iron and steel schedule should begin at the bottom, but we cannot see that the free-listing of barbed wire is forbidden by the statistics; for $4,322,311 worth of such wire (with $4,074,655 worth of other wire) was exported in 1910. Exports of bands suitable for cotton ties have not been large, but we presume that the domestic demand would easily be supplied by our manufacturers if there were no duty.

Because many of the duties which the House Democrats propose to remove are merely nominal, and because others, on account of the large exports, are really no longer required for protection, the effect of an enactment of this Free List bill upon prices in our market would probably be small and disappointing. For example, no reduction in the cost of grain products or meats could be expected, nor would the price of agricultural implements be cut down. Harvesters, mowers and the like would not be sent here from Europe, nor would they come from Canada, where our manufacturers have established branch factories, and where, we understand, the price of such machines is higher than it is in this country. With respect to a few items in the long list, however, the consumer would gain something.

The Natatorium

When a city boy goes to Amherst College he is surprised to learn that he cannot hope to get his diploma until he has learned to swim. Swimming is made a branch of education. To gain the life-saving art Freshman River is rather contracted, and the Connecticut River is some miles away; so there has been provided a spacious natatorium in which the art is taught under a competent instructor; and then there are added all the fancy frills, and every year there is a swimming contest with Williams to test comparative excellence in spurting and diving in the water. Swimming becomes a college discipline and also a college game. The prime purpose is education, and it properly develops into play. It is a department of culture—physical culture.

Yet, important as it is that every boy should learn to swim, that ought to be

learned before going to college. It is not what colleges are established for. It is ancillary, provided for physical culture, and for the primary education of those whose instruction has been neglected in their earlier years. It makes the body supple, so that the mind can be nimble. In the old days, when dyspepsia was the bane of students, and the necessity of physical exercise had not been learned, so many of the students in Andover Seminary had lost their health that the trustees built a large stone building, afterward converted into a residence for Professor and Mrs. Stowe, as a carpenter shop, where healthy and profitable exercise might be gained, for in those days a gymnasium devoted wholly to physical culture and play had not been thought of. But it was desirable that they should learn to be carpenters, like their Master. So early did the practical, the vocational, enter into the scheme of education.

Perhaps we have carried too far in these days both the physical and the vocational in our provisions for education. We observe that the class of '85, in their memorial to the trustees of Amherst College, ask for no further development in athletics, but do ask that in such a college the vocational purpose be strictly subordinated, and that it be made clear that the ideal college has the sole purpose to give that general broad culture on which professional and vocational acquirement can later be based. They would not have young men hurried into breadwinning. Let them know something first, something more than the sciences which will make them chemists and engineers and hurry them into a business career. The memorialists have no sympathy with the scheme which would allow two years of the college course to required studies, and then encourage the young men to elect for the one or two succeeding years such studies as will most tell in their subsequent professions or business careers.

The memoralists are right. To give the country leaders in public life, for statesmen, for guides of public opinion, we need men of the broadest culture possible, not specialists only. And for such broad culture the four years of college life is none too short a time. For the field of knowledge is now extremely broad, and a cultured man must understand the history of the world's progress. He must, or should, learn the old discipline which comes thru the languages which first gave us civilization and law, which taught us liberty and philosophy and art, and also by its imperial sway unified the discordant nations into a fellowship of commerce and government. We cannot and would not escape our social ancestry. We must not neglect the Greek and Latin of Homer and Plato and Virgil and Cicero. Culture, literary or sociological, must have them still.

Then there are the newer sciences, whether physical or biological or social. Being new there is no danger that they will be neglected. But they are so many that some of them will be likely to be overlooked, unless the college course provides wisely that chemistry shall not crowd out biology, and that the young man who has become so fascinated with his classics shall not forget that he lives in the present age, when he who does not know more than the elements of electricity is a helpless ignoramus; and when the chemist or the biologist who has not thought much of the problems of sociology and political economy is fit to be the companion of kingcrabs or the mere slave of a blowpipe. Let the graduate departments of the universities give us learned specialists, but let their task be based on the broadest culture of the full four years of the undergraduate college course.

Ex-President Northrop

It seems strange to write it so after twenty-seven years of familiarity with the words "President Northrop." It was doubtless wise for him to retire from active service at the age of seventy-seven tho in the plentitude of his powers, for the unprecedented growth of the University of Minnesota throws heavier burdens and responsibilities upon the administration. But few if any retiring presidents have been rewarded by more sincere regret and personal affection. The government of the University of Minnesota has been a patriarchate. Cyrus Northrop remained a father to his flock, even when the number of his fac-

ulty rose into three figures and of his students into four. It was the relation of a beloved pastor to his church, of the ideal president of the old small college. His chapel talks, practical, spiritual, sentimental and humorous as they were, derived their force largely from his character. He knew the students he was talking to and they knew him. We realize that the management of 5,000 students and the expenditure of millions of dollars necessitate modern business methods, but we wonder whether the alumnus will ever come to feel the same affection for a filing cabinet, a system of quadruple entry reports and an efficiency expert, as he had for "Prexy," even tho he may sometimes have laughed at his old-fashioned ways. And will a card index take the place of a man as a model for the character of impressionable youth. In the large universities of the present and the larger that are to come, a student may indeed have admiration and regard for his president, but it can scarcely be more personal and reciprocal than his feeling toward the President of the United States.

The change of administration was made with the republican simplicity that still prevails in the West. One morning at chapel President Northrop gave his farewell address, commending his successor to the good will of the students by the words "Remember his coming is not the cause of my going, but my going is the cause of his coming." Afterward, in the office, President Northrop bestowed his benediction upon his successor with the laying on of hands, and turning with a final jest, left the room. The next morning the usual chapel exercises were conducted by President Vincent.

The new president, George Edgar Vincent, is well fitted for the position. He is familiar with administrative work, for he has been three years dean of the college faculties in the University of Chicago, and his work in the Chautauqua system during the last twenty-five years qualifies him especially for the extension of educational facilities to the whole State, which will doubtless be the aim of the University of Minnesota. As a Yale man of '85, as Northrop was of '57, he will find in Minneapolis not a little of the Yale tradition and atmosphere, for here, as in most of the Western States, the pioneer work in higher education owed much to Yale men. His opportunity for usefulness in this new field is exceptional, for the State is large and rich, and its population is of an unusually intelligent class. Already the University of Minnesota is the largest of any university in America except Columbia; tho if we include the summer sessions, it ranks sixth. In the increase in students since last year it has made the greatest gains of any except Columbia, and there is no reason to think that this rate of increase should slacken in the near future. But what Minnesota needs now more than numbers is the development of graduate work and the cultivation of a spirit of productive scholarship and research.

Barbarian or Civilized?

Some one has defined barbarism as that stage of culture in which a people, still savage in instincts, has come into the enjoyment of an economic abundance proper to civilization. This definition should not be quoted too often in America, for there are civilized men and women in every county in the United States. Knowing that they are patriotic and hopeful, we have no wish to discourage them, and we shall therefore express our reflections on this theme as far as possible in the language of optimism.

To begin with, it is clear that a people which has become barbaric is making progress. Savages cannot be transformed into civilized beings directly or in a generation; nor, so far as we can see, can the amelioration of instincts and tastes be effected until after that "basis of civilization," namely, economic surplus, which Professor Patten tells us about, has been attained. So far there is nothing in the American situation to justify despondency. Already we have the "basis" and numerous indications here and there assure us that in every part of our national domain the instincts of savagery are yielding before the benign influences of affluence.

For example, your true savage, so far as our ethnological information goes, never has his nails manicured. In America, manicuring may, without exaggeration, be described as "attained." For a

people that has not yet learned how to take care of its own nails as a part of the morning toilet, this is plainly a step in advance, and that it is the disposition of our well-to-do classes to encourage the manicure habit may be seen on any of our well equipped Pullman trains. The observing traveler has been annoyed, perhaps, by the loud language of an expensively attired lady across the aisle. Presently, however, she presses a button; the colored maid appears, receives an order and quickly reappears with a table. Then bowls, warm water, scissors and files are carefully placed in position and operations begin. Of the educational value of this public example there can be, we think, no doubt.

The savage as a rule will not take the trouble to separate scalps, more or less gory, from appropriated hair with which he adorns his person. Americans are more particular. As a general thing they discard the scalps and make use only of the hair, which is deftly twisted in with their own. This is a distinct step forward. Hair applied without the scalps is more becoming, and it presents a touch of refinement of which the savage is incapable.

Similar reflections apply to the feathers, wings, bird beaks, paws, claws, tails and such like totemistic emblems, as worn by American females. Almost invariably, these objects are used with a degree of moderation, and with a certain touch of appropriateness seldom witnessed among savages, who lack restraint and rarely exhibit discrimination in making suitable combinations of forms and colors. Americans pick and choose, and without picking and choosing there can be no true art.

American males also show in many ways that they, too, are susceptible to influences born of affluence. There is evidence that the savage takes actual delight in killing. We doubt if American men, as a rule, derive satisfaction from the suffering incidental to their manly sports of deer stalking, squirrel shooting, bird bagging, fox hunting with hounds, and the like. The American is interested in these pursuits primarily because he wants to be a gentleman, and if he knew how to be a gentleman in some other way he would be willing to relinquish the infliction of pain. Or, he desires to advance human knowledge by collecting hides and heads and antlers for the adornment of his hallway and dining-room. Surely these are worthy motives.

We suspect that it is really because Americans want to be gentlemen that they so often inflict pain and death on their fellow citizens. Why, for example, should they pack hundreds of girls in a sweatshop fire trap, and lock the doors to prevent possible escape, if this were not a ready way to obtain the income necessary for men who would live well and maintain a respectable establishment. Gentlemen, for example, must have automobiles. They cannot ride with the common herd in subway trains.

It is not quite fair, we think, to argue that if Americans were really becoming civilized they would not make their toilets in public, nor run down pedestrians in the streets, nor imitate the costumes of savagery, nor exploit the helpless, nor make bonfires of their historical records. Civilization is not possible until people cease to swagger, cease to be greedy, cease to obtrude their own personal affairs upon their fellow men. It is not possible until they begin to feel kindly and humanely, to care for knowledge and ideas, to value justice and to behave with self respect. But these qualities and habits are the final products of evolution. We cannot have them until we have little by little achieved the things that precede them and produce them. Let us not be unreasonable or impatient. We have made progress. We are no longer mere howling, dirt-eating savages. We have attained affluence. We have begun to be barbarians. One of these days our posterity may be civilized.

Let the Coal Be Mined

A RAILROAD from the rich Bonanza copper mine of Alaska was completed a few days ago, and ore is coming down by the trainload to ships that will carry it to Tacoma. When the first of these ships enters Tacoma harbor she will carry a flag with these words on it:

"First load of copper ore from Bonanza mine; a million tons to follow. We also have coal of our own. Let us mine it."

There are mountains of fine coal in Alaska, but no one is allowed to mine it.

Our laws relating to public land which contains coal are out of date and absurd. Several groups of men who attempted to obtain possession of Alaska coal lands by fraud (so the indictments say) are on trial or will soon be tried. Their claims, representing an expenditure of a few hundred dollars, cover deposits of coal whose value is estimated to be not less than $300,000,000. If they are guilty of fraud they should not have this coal. Nor should there be any statute by which a man for a few dollars can lawfully obtain possession of public land worth millions.

Congress has known for years that the land laws ought to be revised, but Congress avoids revision. It ignores the earnest recommendations of the President and of its own committees. Industries in Alaska that use coal must import it at a cost of $12 a ton, altho there are millions of tons near at hand and almost in sight. The Democrats in the House should add to their legislative program the enactment of laws to permit the mining of this coal, even at the cost of displacing one of their tariff bills.

Faith

THE primitive cave men looked abroad on a great ocean, supposing that it bounded the earth on all sides and that to venture out upon it was death. And if they had been asked whether the time would come for bolder and wiser people to cross that ocean by thousands, in ships of steel, they would have answered, "Never!" The civilized and esthetic Greeks looked up into the blue heavens and longed to wing their way to the hights where dwelt the gods. They have told us how Dædalus and Icarus made the attempt, and of the wax that melted. But if they had been asked whether men and women could command the air at last and fly at will from city to city, they would have answered, "Never!" The haughty Roman generals and their invincible legions believed that one class of people was born to serve, another to rule, and that no great nation could live without the purchase of human bodies for slave labor. And if one had told them that today slavery would be universally abhorred by the grandest nations, and that equality before the law would be an ideal of the sanest people, they would have said, "Never!" If our forefathers had been told the wonders of the telephone, they would have shaken their heads in utter skepticism. If the mothers of earlier generations, who gave us their blood and their tears, could have heard prophecy of the great woman movement, forward to health, education and citizenship, they would have murmured, "Never!"

But in spite of old beliefs and disbeliefs, we command earth and sea and sky, and compel electric currents and vibrations of air and ether to do our bidding. The strongest nations stand for the free government of men, and our women are pressing forward to demand the same for themselves. And, if one asks us whether war will ever cease and world federation secure universal peace; whether brotherhood and cooperation will ever replace competition among the children of men; whether our marriages shall one day be pure and our births healthy, will we answer, "Never"?

Or will we, by our optimism, hasten the day of good, declaring that nothing is too grand for the future to accomplish, nothing too holy for the race to attain, that to limit yourself is to close doors that might otherwise open to strength; and that to limit the future is to limit God?

The Ambassadorships

Dr. David J. Hill, Ambassador to the Court of Berlin, has resigned his post. His appointment was an attempt to see whether a man, competent in every other way, could succeed without wealth on the scale of remuneration which our Government allows its diplomatic representatives. We fear that the experiment has not proved a success; it needs a millionaire to pay the bills which the country does not pay. On his taking apartments instead of a big house the Emperor was displeased, and since he moved into a separate house the Emperor has never visited him. Whether there was any other reason for accepting his resignation the public is not

informed, altho gossip does not fail to guess. This we know, that as courts go republican economy is not approved, and thrift interferes with success. At least Congress ought at every court to provide a residence for our legations. We have begun to recognize the duty and will doubtless before long provide at least for our Ambassadors. The transfer of Ambassador Rockhill from St. Petersburg to Constantinople is a promotion in the way of work, but not in social duties, and will, we doubt not, please Mr. Rockhill. He is a most competent man, has served in Peking, and knows the intricacies of Eastern policy. If it is to be the duty of our representative to aid the introduction of American capital into Turkey he will be found a good match for the best of the European representatives at the Porte. It is only since the Turkish revolution that it has begun to seem safe to risk investments into Asiatic Turkey. Now railroads are to be built everywhere. That is better than massacres.

Discrimination Rebuked at Cornell

President Schurman has struck the right note. The 269 women students who signed the petition that two colored girls be excluded from Sage College have been very properly rebuked, and the president tells them that "at Cornell all university doors must remain open to all students, irrespective of race or color or creed or social standing or pecuniary condition." It is amazing that 269 girls could have joined in such an unworthy act, so unladylike, so unchristian. We do not doubt that they had read or heard of the priest and the Levite who walked by the man beaten by thieves, but they simply passed by and said nothing; they did not insult him or kick him out of their road. It is said to be the intuition of a generous soul to help the under dog. That is the condition of the negro in our civilization; and the first intuition of generosity should be to give the negro courteous help before giving such help to those who can better help themselves. For this same reason in States where the negroes are many and ignorant the public schools should care even more carefully for them that for white scholars. We echo the belief of President Schurman that these 269 women students will, out of very penitence for their error, be especially careful to "make the lives of the two incoming students happy."

Popular Passion and War

We have never accepted the assertion that it was the popular passion due to the destruction of the Maine in Havana Harbor that drove our Government into war with Spain. Now the London *Spectator* declares that the wars of the last half century have none of them had such a cause. War, it says, has rather been an essential element of state policy. The wars which Germany has made or threatened have come out of no popular frenzy. The war of Prussia with Austria was from motives of high policy, because Bismarck wanted to assert the nation's leadership in the German-speaking world. So in the war with France, the Prussians were not spoiling for a fight, but it consolidated Germany under Prussian leadership. Germany's later threat of war with France and Morocco was a matter of mere statecraft. And the *Spectator* concludes:

> "The best example of all, however, is what took place just two years ago when Germany's threat of war and known ability to enforce the threat silenced in an instant all talk about the rights of international law and of Austria tearing up the Treaty of Berlin without getting the consent of the other signatories to the treaty."

It is this accepted policy, to use war or the threat of war as an instrument of statecraft, which explains why Germany is less willing to consider arbitration than are the other great nations.

Reform of the Calendar

A correspondent writes us that in the discussions of methods for the reform of the calendar, there is one that appears to be more practicable, and less objectionable, than any of those given. In a romance, the name and author of which are quite forgotten, the hero was restored to consciousness in the fashion of "Looking Backward," after a century of oblivion. One of the reforms that he found had been effected was a rearrangement of the calendar, as follows: There were thirteen months of twenty-eight days each, all beginning and ending, of

course, on the same day of the week. This left one day in ordinary years, and two on leap years, to be disposed of. These were cared for by making the first the final day of the year, and calling it "Old Year's Day." The odd day in leap years was placed between Old and New Year's Days, and called Leap Year Day. The great simplicity of this plan, the easy way in which it solves all the complications of our present calendar, must highly commend it. Every year and every month would begin on the same day of the week, presumably Sunday. From this beginning, and with exactly four weeks in each month, the day of the week upon which any date would fall would come quickly to mind. With but slight practice they would present themselves simultaneously. The one objection to it is that the Sabbath would be carried forward one day every year, and two days in leap year. There would be seven or eight consecutive week days at the end of the year. It would seem as tho the practical gain in simplicity and convenience would be sufficient to approve it. We wonder if God would object.

Civic Duty of the Church

THE INDEPENDENT has long stood on record as in favor of taxing church property; especially as a very large part of this is withdrawn from industrial production, and the taxes that it would pay are distributed on the shoulders of others. The New York *City Record* shows a total of $163,000,000 of untaxed property in the class we have suggested. The value of this property is climbing up at the rate of over one million a year. It is not a slur on the churches to say that all this property should be faced toward the enlightenment and the betterment of the people. It should not be withdrawn from taxation, but should be made to do its very best in the way of education and reform. *The Survey* has taken up the subject, and Robert C. Sanger is permitted to say in its columns that the overcrowded schools, the overworked teachers and the neglected children demand social justice of the Church. Upon the Church rests not only a certain religious, but a great civic, responsibility, which it cannot avoid thru its specific mission. This is to renew the very strong convictions exprest by Mr. Roosevelt's Commission on Rural Affairs. The Church must come to the front as a civic leader, and instead of withdrawing its properties from public use, should take care to keep them thoroly operative for human interests. In this way it can rally the people, and can organize them for the real end of religion, which is human betterment.

Pittsburg has enough to be responsible for without adding to its disrepute. Some of its most respectable citizens and bankers had to be sent to prison not so very long ago for political graft, and then followed the exposure of the bad social and industrial conditions. Now one of its clergymen, M. L. McEwan, D.D., has presented an overture to the Pittsburg presbytery bringing charges of heresy against two of the professors of Union Theological Seminary. One would think that the scandal and the injury of the former trial of Professor Briggs was enough. It drove Professor Briggs into the Episcopal Church and Professor McGiffert into the Congregational Church, and did Union Seminary no sort of injury, while it was a real injury to the Presbyterian Church. Dr McEwan will hardly succeed in starting another trial. Or if there should be, there are other denominations that will gladly welcome heretics of their sort.

The statistics for the consumption of alcoholic liquors in Great Britain and Ireland show a gradually improved habit of temperance. A curious effect appears in the decreased number of deaths from alcoholism and cirrhosis of the liver, a disease caused by alcoholism, as the *per capita* consumption of alcoholic liquors has diminished. Thus in England and Wales the expenditure per head for alcohol in 1900 was $22.59, and the deaths from alcoholism were 113 per million, and 144 from cirrhosis; while in 1909, with a considerably increased cost of liquors, due to taxation, the expenditure *per capita* had fallen to $17.24, and the deaths from alcoholism to 47, and from cirrhosis to 99. Evidently temperance is making progress in Great Britain.

It was not to the credit of responsible journalism that last week a story was published in a number of newspapers which told us of a secret treaty between Mexico and Japan for the acquisition of what would be a Japanese military base on the western coast of our sister republic. It was declared that some one had secretly shown the treaty to our Minister in Mexico and he photographed it and took it hurriedly to Washington; and that this was the cause for the massing of troops on the Mexican frontier as a threat of war. Some one has the interest to get up these war scares, and succeeded in duping respectable journals.

Denman Thompson died last week. With the exception of Joseph Jefferson's "Rip Van Winkle," Thompson's "Old Homestead" was the most beloved play ever put upon the American stage. Now all the "critics" are telling their readers why "The Old Homestead" was not a great play and ought not to have succeeded, tho its appeal was universal. The critics, you know, prefer a triangular intrigue constructed on the French model. Nevertheless no better play than "The Old Homestead" has been put on the American stage for a generation. Give us the verdict of the people and we don't care what the critics say.

Sir Andrew Fraser, ex-Governor of Bengal, was for thirty-seven years connected with the Government service in India. In his new volume, "Among Indian Rajahs and Ryots," he indicates his sympathy and fellowship with the native people whom Englishmen so often look down upon. It will indicate his attitude that at Nagpur he was a member of a native Presbyterian church, which had a native pastor, and was a member of the session with natives. As a member of the kirk session he accompanied an Indian brother elder to visit the Christian families of the place. His testimony in favor of the native Christians is very favorable.

There was much complaint two years ago because at the time of the eucharistic celebration in London a Catholic procession thru the streets was allowed. But last week, for the first time in 300 years, the Anglican Bishop of London led a procession of 4,000 men from Trafalgar square thru the Strand and Fleet street to St. Paul's Cathedral. The bishop was preceded by a priest carrying the cross, the clergy in white surplices followed and the laymen. Exactly what good came from it is not clear, but it looks like another case of imitation of the Catholics.

The announcement by Prof. C. T. B. Fennell, of the University of Cincinnati that he has extracted a new element from iodine, is extremely interesting and important if it is confirmed. One would hardly have expected it from iodine, which has a combining weight only about half of that of those elements from which radium has been obtained. But iodine has long been a disturbing factor in the order of the elements under Mendeleef's law, and we wait for further proof. We now paradoxically allow that all the elements are composite.

What! Modernism among the Mormons! The Board of Education of the Mormon Church finds that three professors in the Brigham Young University are Modernists, and therefore heretics. They have been applying higher criticism to the Old Testament, and they will not recant. There should be an oath imposed on all Mormon teachers and preachers that they will never think otherwise than Joseph Smith and Brigham Young thought and taught.

The House of Representatives is ready enough to vote for an amendment to the Constitution for the popular election of Senators. It required a two-thirds vote, but it was carried by 296 to 16. In the Senate the case will be different, and it is by no means clear that it will carry. Senators are concerned as to the way they are elected.

The *Cornell Era* says: "The student body has been growing more temperate and self-controlled within the last few years. At present the percentage of students who get drunk with any degree of regularity is so small as to be almost negligible." This is distinctly encouraging. Let the good work go on.

INSURANCE

Automobile Accidents

SOME very interesting figures on automobile accidents are given in the recent report of the Travelers Insurance Company of Hartford. The company in 1909 paid 684 claims, amounting to $113,790. In 1910 a total of 1,040 claims were paid, amounting to $185,331. It is noted that 39 per cent. of the accidents occurred while cranking the machine. The number of accidents due to this cause increased from 253 to 423, and the amount of claims paid from $19,607 to $37,266. Carelessness in the simple operation of entering and leaving the car resulted in the injury of 87 people. While repairing or taking care of automobiles 183 people were injured, and three were killed. The skidding and ditching of machines caused the injury of ninety people and the death of four. Collisions caused injuries to 116 persons and the death of five. While a few of the accidents were unavoidable or due to causes beyond control, by far the larger proportion were due to carelessness or lack of skill and knowledge.

THE announcement that life insurance companies were attempting to invest the money received from policyholders in the States from which the funds were derived has been regarded with some doubt. The report of the Equitable Life Assurance Society for 1910, however, shows that at the end of 1905 there were $86,530,983 of mortgage loans confined to ten States, while at the end of 1910 there were $99,138,123 of mortgage loans outstanding invested in thirty-four States. This seems to be conclusive evidence that this society is distributing its investments as promised.

THE proportion of insurance capital to insurance liabilities is very much on the decrease. In the past forty years the liabilities have almost doubled, while only $6,000,000 more capital was invested in the business in 1910 than in 1870. Between 1880 and the close of 1908, 912 fire insurance companies retired from business in the United States.

THE rank of the ten leading life insurance companies based on the total insurance in force, including industrial policies, as given out by the recent tables of the New York State Insurance Department, is as follows:

1.	Metropolitan	$2,215,851,388
2.	New York Life	2,039,863,031
3.	Prudential	1,851,258,349
4.	Mutual of N. Y.	1,464,024,396
5.	Equitable, N. Y.	1,347,158,692
6.	Northwestern Mutual	1,080,139,708
7.	John Hancock	566,316,365
8.	Mutual Benefit	543,658,197
9.	Penn Mutual	499,563,062
10.	Aetna Life	307,102,649

The rank of the first ten companies on the basis of total assets is as follows:

1.	New York Life	$637,876,567
2.	Mutual of New York	572,859,063
3.	Equitable, N. Y.	485,192,957
4.	Metropolitan	313,988,334
5.	Northwestern	273,813,037
6.	Prudential	226,715,391
7.	Mutual Benefit	137,602,579
8.	Penn Mutual	116,803,021
9.	Aetna Life	95,245,844
10.	Union Central	81,234,785

The total number of American companies licensed to write life insurance under legal reserve laws is 230.

THE New York Life Insurance Company reports that during the year 1910 it paid claims upon ninety-five lives who died within one year after insuring. The total amount paid under these policies, in force less than one year, was $971,926. This statement does not include any substandard policies, but covers only men who had passed as first class risks. These figures are a stronger argument for a man in perfect health to take out life insurance than any essay that could be written on the subject.

THE fire waste of the United States in the past ten years exceeds the amount of gold held in the United Kingdom, Austria-Hungary, Italy and Spain. It is equivalent to wiping out the entire corn crop once every ten years, and exceeds the annual value of wheat, hay, rye and oats. It is twice the annual value of the cotton crop. And most of this waste is easily preventable and due to carelessness in one form or another.

FINANCIAL

The Growing Wheat

THIS year's first crop report, issued by the Department of Agriculture last week, promises a large yield of winter wheat. The condition of the growing plants is 83.3. This is below the ten years' average, but, owing to the notable increase of acreage, the New York Produce Exchange's estimate of the indicated crop is 541,415,000 bushels. It may be recalled that the greatest crop of winter wheat in past years, that of 1906, was 492,888,000, and that last year's was only 464,000,000. The estimate mentioned above, however, makes no allowance for acreage winter-killed and abandoned. A year ago there were 4,000,000 acres more at the beginning than at the end. But the loss then was exceptionally great. The area at the beginning this time exceeded that of any preceding year by 1,000,000 acres, and the loss on account of winter-killing has been small. While it must not be forgotten that April condition figures and estimates have frequently been misleading, it can be said that there is fair promise of a very large crop. Last year's area at harvest was 29,427,000 acres. As 34,485,000 acres were sown for this year's crop, the area at the coming harvest will probably exceed that of last year by at least 2,500,000 acres.

A Dull Stock Market

IN the last few weeks, business on the New York Stock Exchange has been exceptionally dull. The transactions last week amounted to only 578,000 shares, or less than the average for a single day under normal conditions. Owing to the holidays, it was a short week, but the record for the week preceding was only 966,000 shares. Last week's business may be compared with the 3,760,000 shares of the corresponding week in 1910, and the 4,777,000 for the week of the same date in 1909. Sales on the 12th were only 106,267 shares. Two days excepted (July 3, 1908, and March 10, 1904) this was the smallest total in fifteen years. Investors and traders have been waiting for the Trust case decisions. Brokers have been idle and are complaining. Prices have suffered scarcely any change. Those of active stocks last week, as a rule, were very slightly reduced.

....The Rand output of gold was greater in March (676,065 fine ounces) than in any preceding month.

....Manufacturers in this country are exporting tin plate at the rate of about 36,000,000 pounds a year.

....The city of Chicago has thus far received from street railways $6,109,845, in accordance with the terms of the twenty-year franchise granted four years ago.

....Senator Cummins's resolution directing the National Monetary Commission to make its final report not later than December 4 next, and providing that immediately thereafter the Commission shall cease to exist, should be adopted.

....The State of New York made a very successful sale, last week, of $10,000,000 of 4 per cent. canal bonds. Bids amounted to nearly $115,000,000. The largest award was $9,894,000, to the Guaranty Trust Company, Fisk & Robinson and Rhoades & Co. of New York City (on a joint bid) at 104.3013.

....According to reports filed recently in London, the estate, legacy and succession duties on the estate of the late Charles Morrison ($54,683,330) amount to about $10,000,000. The duties on the estate of the late Alfred Beit, which was $40,248,080, were about $3,000,000. He left a large part of his fortune for public uses.

....The world's output of copper has grown from 494,200 tons in 1900 to 863,000 tons in 1910, and consumption has not kept pace with it. More than half of this output is credited to the United States. The first shipment of copper ore by rail from the mines in Alaska to the port of Cordova was made a few days ago. This ore, about 70 per cent. copper, is smelted at Tacoma.

The Independent

VOL. LXX NEW YORK, THURSDAY, APRIL 27, 1911 No. 3256

Survey of the World

An Armistice in Mexico

The efforts of Dr. Gomez, the elder Madero and others to promote negotiations for a peace agreement in Mexico were crowned with success on the 22d, when General Madero accepted a proposition for an armistice of four days, covering the zone between Juarez and the city of Chihuahua, "in order," as he said, "to negotiate peace in conferences which are to follow." The armistice agreement was signed on the 23d, and its terms extended to five days, beginning at noon of that day. Peace is now looked for. At the end Madero did not insist upon the immediate resignation of Diaz. He even denied that he had ever insisted upon it. He had proclaimed no ultimatum, he continued; he desired to avoid further bloodshed and would make concessions. Ambassador Zamacona asserted that his Government had addressed no offer to Madero, but had been ready to consider any proposition. The change in Madero's attitude at a time when he was preparing to attack Juarez with an army of 3,000 men, which almost surrounded the city, appears to have been caused by the arguments of his father and the repeated warnings of Dr. Gomez (the revolutionist agent at Washington) that a battle at Juarez like the one at Agua Prieta might cause intervention. The elder Madero did not reach his son's camp until the 21st, and then, at his request, the promised assault upon Juarez was deferred for twenty-four hours. Unofficial representatives of the Mexican Government—Señors Obregon, Braniff, Hernandez and Moye—had been arguing there with Madero in vain. But Madero's father and uncle, bringing news of the danger of boundary warfare, with reports of their conferences with Limantour and De la Barra, and much late information of which the revolutionist leader in his mountain camp had been deprived, convinced him that it would be the part of wisdom to stop fighting for a few days and begin negotiations. There were reports, on the 23d, that Government positions of high rank would be offered to Madero and several of his associates.——Until the end of the week the situation showed no signs of improvement. At Agua Prieta, the revolutionists in possession were attacked by Federal troops on the 17th. After fighting all day the Federals, late at night, had gained nothing, but had lost two machine guns. Both armies had been warned by our Government, but many bullets fell in the streets of Douglas, where seven residents were wounded. When the assault was renewed, at dawn on the 18th, the Federals discovered that the revolutionists had fled. Two of their commanders, Colonels Garcia and Medina, had voluntarily surrendered to the American troops. While it is true that the revolutionists' ammunition was exhausted, it is also true, as Colonel Medina explained, that many of them were disabled by intoxication. They had looted the saloons and grocery stores. Rebel reinforcements were at hand, and one party of 800 men approached the town soon after the Federals had taken possession of it. A few bullets informed them that their friends were no longer in the place, and they retired. Because seven residents of Douglas were wounded, the Governor of Arizona sent a protest to the President, who said, in the course of his reply:

"The situation might justify me in ordering our troops to cross the border and attempt to stop the fighting, or to fire upon both com-

batants from the American side. But if I take this step I must face the possibility of resistance and greater bloodshed, and also the danger of having our motives misconstrued and misrepresented, and of thus inflaming Mexican popular indignation against many thousands of Americans now in Mexico, and jeopardizing their lives and property. The pressure for general intervention under such conditions it might not be practicable to resist. It is impossible to foresee or reckon the consequences of such a course, and we must use the greatest self-restraint to avoid it. Pending my urgent representations to the Mexican Government, I cannot, therefore, order the troops at Douglas to cross the border; but I must ask you and the local authorities, in case the danger seems to threaten, to direct the people of Douglas to place themselves where bullets cannot reach them, and thus avoid casualties."

Because the situation was full of danger, the evacuation of Agua Prieta was regarded at Washington with a feeling of relief.——Altho official reports asserted that Mexico's reply to our demands concerning battles on the boundary was satisfactory, special dispatches from Mexico quoting passages showed that a large part of it consisted of counter charges and recriminations. Mexico, it said, regretted the casualties and would try to guard against them, but a majority of the rebel fighters were Americans and they had fired the shots. Douglas policemen had assisted them; the American commander had shown bias in favor of them, and had crossed the line to urge the Federals to surrender. Before the official copy reached Washington, a part of the reply (referring to this crossing) was canceled by telegraph. President Taft commented upon the incident in a good-natured way, saying it required two to make a quarrel, and at the end of the week there were complimentary official references by Mexico to his sense of justice.——In a long interview, Minister Limantour spoke of the danger on the border, where Americans sympathized with the revolutionists. Restrictions imposed at the request of our Government, he asserted, had reduced the efficiency of the Federal troops there by 75 per cent. He feared the effect of a battle at Juarez. He was not very hopeful (on the 20th) of an armistice, for Madero was a dreamer, a vegetarian and a spiritualist, who listened to mysterious voices which no one else could hear. For a generation to come, in his opinion, Mexico would not be ripe for the advanced democratic government prevailing in the United States.

Debate in the Senate

In the Senate at Washington, on the 20th, Mr. Stone spoke at length for his resolution authorizing the President to send the army across the boundary if force should be required to protect American lives and property. Mr. Taft, he said, would be justified in preventing such bloody outrages as the one at Douglas and Agua Prieta. He was earnestly opposed by several Senators. Mr. Root solemnly protested against the resolution, saying the adoption of it would be equivalent to a declaration of war. Similar objections were raised by Senators Bacon, Lodge and Cullom, who urged that if the question must be the subject of discussion in the Senate, the debate should take place in secret session. It was evident that the Senate was not in sympathy with Mr. Stone. ——During the week there were indications that the revolution was growing. In Puebla there was a battle, at a point only 150 miles from the capital; 1,300 Federals were engaged and 100 rebels were killed. Three towns in Sinaloa were taken and sacked by rebels. Acapulco called for help, expecting attack by 800 rebels. At Tamazula, in Durango, a band of rebels was defeated, and 69 of them were killed. One of these was the commander, William Collins, an American. At Bauche, near Juarez, Capt. Oscar Creighton, the American who had destroyed many railroad bridges, was killed. He was engaged to be married to Miss Hughes, of El Paso. ——On the 21st, Diaz gave a full pardon to Converse and Blatt, the two young Americans in prison at Juarez. He had given an audience to Converse's father and been imprest by his plea.—— Before the agreement for an armistice was reached, Madero had sent formal notice to General Navarro that if Diaz did not at once resign he would attack Juarez not later than 5 p. m. on the 21st. A delay of twenty-four hours, made at the elder Madero's request, gave time for the agreement, but Madero's army retained its position near the city.

Canadian Reciprocity

The House of Representatives voted the Canadian reciprocity agreement April 21, the vote being 266 to 89. The agreement had 45 more votes than at the last session (221 to 92). Seventy-eight Republicans, one less than a majority of Representatives of that party in the House, opposed the measure. Sixty-four Republicans voted aye. The following eleven Democrats deserted their party organization by voting against the bill:

Bathrick, Claypool, Doughton, Fowler, Gudger, Hammond, Pujo, Rucker of Colorado, Webb, Whiteacre, and Aken of New York.

Before the vote was taken ex-Speaker Cannon and Representative Dalzell, of Pennsylvania, boasted that the agreement would be opposed by a large majority of the Republican representatives. The sixty-four Republicans who opposed the Administration measure included a majority of the insurgents. Fifteen Republicans, including four New York Congressmen, Andrus, Draper, Payne and Vreeland, were unrecorded. Numerous amendments, offered by Republican members with a view to embarrassing the Democratic leaders, were voted down. Mr. Lenroot offered the Underwood "farmer's free list" bill as an amendment, making it apply only to Canada; but Mr. Underwood told him that he would, this week, have a chance to vote for the application of the free list to the whole world. In the course of the debate Mr. Underwood informed the House that telegrams just received from his Alabama district stated that the United States Steel Corporation had shut down its mills there and thrown 3,000 men out of work, on the ground that they must punish him for pushing, as chairman of the Ways and Means Committee, the reciprocity and free list bills. His declaration that he would continue his attacks upon "the monopolistic system of protection," regardless of the effect upon his personal fortunes, aroused Democratic enthusiasm.——From Ottawa it is reported that Conservative members of the Canadian Parliament, returning from their Easter visits to their constituencies, declare their belief that the duty of the opposition is to force the Government to appeal to the country and bring on a general election next fall. Altho in a minority, the opposition might perhaps accomplish this by withholding votes for supplies. Many Conservative members are, however, in favor of letting the reciprocity measure pass without serious opposition, feeling that the adoption of the agreement is inevitable.

The Free List Bill

The "farmers' free list" bill, reported to the House of Representatives by Chairman Underwood, of the Ways and Means Committee, will reduce the tariff revenue $10,016,495 annually, on the basis of the importations for the last fiscal year. In the majority report this amount is described as "inconsiderable in comparison with the great saving and advantages to all of our people from the additions to the free list provided for."

"In several public addresses," says the report, "the President had admitted that the tariff rates have resulted in excessively high prices, felt especially in the increased cost of living which now bears heavily on our people. . . . The Canadian reciprocity agreement now before the House is a recognition on the part of the Administration of the injurious effects of the extreme protective policy which has so long been imposed upon the country, and is an effort to mitigate its effects."

The Canadian reciprocity pact cannot, however, the report continues, give the American people all the relief from high prices that is needed.

"Action on the agreement involves the necessity of further and immediate action in removing a number of the duties on imports from other countries in order that justice may be done to the great army of the agricultural producers, who, in the Canadian agreement, are to have all the alleged protection removed from their products without a corresponding or reciprocal removal of the protective duties most burdensome on the commodities they must purchase as necessary to sustain their lives and industries."

Details of the free list are discussed in THE INDEPENDENT of April 20, pages 817, 856-857.

Washington Notes

The Senate has passed a resolution offered by Mr. La Follette calling for information from the Interior Department concerning the withdrawal by the President on October 28, 1910, of 12,800 acres of lands that had formed a part of the Alaskan forest reserve, near Cordova, the restoration of

the lands to the public domain, and their subsequent entry. It is asserted that the lands control transportation to and from the Cunningham coal deposits and afford the only outlet for the natural resources of the community. Delegate James Wickersham, of Alaska, says that the lands have been practically commandeered by agents of the Morgan-Guggenheim syndicate.——The House Committee on the Census has authorized a favorable report on the bill fixing the membership of the next House in the Sixty-third Congress at 433, an increase of forty-two over the present membership. Under this plan no State loses in membership, as would have been the case had a total lower than 433 been agreed upon. The bill reported is identical with the Crumpacker measure of the last session, except that it does not give the Department of Commerce and Labor the right to make the reapportionment ten years hence, as did the Republican bill.

The Los Angeles Dynamiters

Last October an explosion killed twenty-one persons and destroyed the building of the Los Angeles *Times*. An attempt to blow up the house of the owner of the newspaper, Gen. Harrison Gray Otis, was frustrated. The murderers escaped, however, and it was only last week that Ottie McManigal, a structural iron worker arrested at Detroit, told the story of a series of crimes, extending over several years, by which more than one hundred lives and property worth $3,500,000 have been sacrificed—crimes of which the Los Angeles tragedy is only one. The other men under arrest are James W. and John J. McNamara, the latter being secretary and treasurer of the International Bridge and Structural Workers' Association, with headquarters in Indianapolis. Others are implicated. McManigal in his confession states that Jim McNamara, M. A. Schmidt and Dave Caplan were the actual agents in the *Times* crime. Jim McNamara furnished McManigal and others with funds and explosives for use on many other occasions, when buildings and railway bridges were blown up. Acting upon information given by McManigal, Detective William J. Burns and one of his assistants have discovered 400 pounds of dynamite in the center of Tiffin, Ohio. The three prisoners are being conveyed to Los Angeles, where they will be placed on trial.

In New Jersey

The Geran election bill, embodying Governor Wilson's ideas of primary and election reform, became a law last week. This act provides that all election officers, of whom there are nearly 5,000 in the State, shall pass civil service examinations. Candidates for election officers may be nominated by any five voters of the respective parties. The Democratic and Republican parties are to have two officers on each district board, to be chosen by lot from those passing the civil service examination. The bill extends the direct primary to include the nomination of candidates for Governor and Congressman, and all delegates, including those to the national conventions. The bill was opposed by Democratic State Chairman Nugent, but supported by the Democratic majority in the Assembly, and it received a majority of votes in the Republican Senate. Its enactment is a victory for the Governor scarcely less notable than the election of James E. Martine as United States Senator. While the Governor was signing the Geran law, the Senate voted favorably on a drastic corrupt practices bill. The basis of this was a measure introduced by Senator John D. Prince, which received radical amendment. As voted by the Senate, it practically prohibits the expenditure of any money for partisan purposes on election day. If voters must be transported to the polls, it must be done at public expense, upon an order from the court obtained at least fourteen days before election, and the application for said order must show that the persons to be taken to the polls live at least two miles from the polling place, that there is no available trolley line, and that they themselves possess no means of transportation. The bill limits, also, the size of the campaign contribution which may be made by any individual and the amount which a candidate may spend in his own behalf. There are various other stern restrictions. The bill is likely to pass the House and to receive the Governor's signature.——The special committee of the New Jersey Assembly, appointed by the Speaker to investigate the

November, 1910, election in Atlantic County reports that there was false registration, illegal voting and vote buying, and that the election officers of the county failed to do their duty. It is estimated in the report that, from the testimony taken, there were approximately 2,000 illegal registrations and 1,000 illegal votes, almost entirely in Atlantic City.

Various Items The Helm committee of the Illinois Legislature heard important testimony, April 20, when William Burgess, of Duluth, stated under oath that last March C. F. Wiehe, secretary and director of the Edward Hines Lumber Company, told him he had subscribed $10,000 to the "pot." The conversation took place on the "Winnipeg flyer," between Duluth and Virginia, Minn., a few days after Lorimer had been exculpated by the United States Senate.

"Wiehe said Lorimer had not used a dollar of his own money," testified Burgess, "but that a jack-pot was raised for his election. He said, 'I know what I am talking about, for I subscribed $10,000 myself.'"

This is the most important testimony in the Lorimer bribery investigation since Clarence J. Funk, of the International Harvester Company, testified that he had been approached by Hines in the Union League Club, Chicago, with a request to subscribe $10,000 to a $100,000 Lorimer fund.——The New York State Senate has passed Senator F. D. Roosevelt's resolution requesting the New York representatives in Congress to favor an amendment to the Federal Constitution providing for the direct election of United States Senators by the people. The vote was a party one, 28 to 16.——C. H. Hyde, City Chamberlain and appointee of Mayor Gaynor, is the subject of a grand jury investigation in New York City, where his deposits of public moneys in the collapsed Carnegie Trust Company are being scrutinized. There are now eleven indictments against William J. Cummins, chief promoter of the Carnegie, who persuaded the bank examiner that Mayor Gaynor and Andrew Carnegie stood back of him and his institution. There are four indictments against the Carnegie Bank president, Joseph B. Reichmann.

The Islands By direction of the Philippine Legislative Assembly, Manuel L. Quezon, Resident Commissioner at Washington, has invited Speaker Champ Clark and other prominent Democratic members of the House to visit the islands, in order that they may learn, the Speaker of the Assembly says, "that our hospitality goes hand in hand with our high aspirations for freedom," and may see "the fitness of the Filipinos for independence." Mr. Quezon remarks that an immediate grant of independence would "end discussion as to the probability of war with Japan." Representative Cline, of Indiana, has introduced in the House a joint resolution declaring that it is the purpose of the United States to establish an independent government on the islands "as soon as conditions necessary for such government shall exist," and then to protect the islands by "a general treaty of neutrality."——The cigar-making industry in Porto Rico has been greatly disturbed by a strike. Two men (one of them the manager of a factory) have been assassinated by a striker. His confession caused the arrest of twenty-two of his associates who were members of a secret society. It is alleged that anarchist posters were found on the walls of the room in which this society's meetings were held.——Lieut. Walter Rodney, of the Second Cavalry, was murdered, on the 17th in Mindanao, by a Moro fanatic, a "juramentado," who had sworn to kill a Christian, believing that in this way he would earn eternal bliss after death.

British Politics The veto bill is being slowly forced thru the House of Commons by the use of the closure, such of the thousand amendments as the Government is willing to consider being voted down at the end of a futile discussion. The sessions of the House have lasted to 4 or 5 o'clock in the morning, and much bad temper has been manifested, especially whenever Mr. Churchill has relieved the Premier in taking charge of the bill. The Opposition holds that the term "money bill," to designate those measures which the House of Lords is not competent to veto, is ambiguous, and that it is dangerous to place in the hands of the Speaker of the House of Com-

mons the sole power of deciding which are money bills. It is also urged that the clause providing that any other bill passed by the House of Commons in three successive sessions shall become a law in spite of its rejection by the House of Lords is too sweeping, and unless some exceptions were specified, the House of Commons would be omnipotent. In reply, Premier Asquith stated that the Government would accept no amendments which would exclude from this clause any class of legislation. "The veto of the Crown is gone," he said. "It is as dead as Queen Anne. It has gone by disuse; so ought the veto of the House of Lords to have gone."——The Unionists gain one seat from a recount in Exeter, where it was reported in December that the Liberal candidate had won by 4 votes, the returns being 4,786 to 4,782. But the two judges who were appointed to investigate the case discovered a great deal of illegal voting, and finally reported that the Unionist really had been elected by a majority of 1, giving as the corrected vote 4,777 to 4,776. The Liberal member who was unseated called the judges biased and unjust, and the crowd hooted them thru the town to their train, an almost unprecedented occurrence in England. When the report of the recount was presented to the House of Commons, there was an attempt to delay its acceptance, but the Speaker overruled the motion and the name of the Unionist was substituted for that of the Liberal on the roll of the House.——The Government is about to present its scheme for insurance against unemployment. The system is to be compulsory and will be applied first to all men employed in house building, shipbuilding and construction works, both union and non-union, skilled and unskilled. A discharged employee will take his card to the nearest of the Government labor exchanges, and they will help him to get another place. If he cannot find work after a reasonable time he will be entitled to about $2 a week for a certain number of weeks in the year. The insurance fund is built up from obligatory contributions from employers and employees, supplemented by a large state subvention.——According to the census, which has just been completed, the population of India is 315,001,099, representing an increase of 7 per cent. over the census of 1901. Of this, the British territory contains 244,172,381, an increase of 5.4 per cent., and the native states and agencies, 70,828,728, an increase of 12.9 per cent. The larger gain of the native states is accounted for by the fact that they are more sparsely settled and had suffered a greater loss of population in the famines of 1897 and 1900 than the British territory.

The Albanian Rising

From the confused reports of the insurrection in the Albanian provinces of European Turkey it may be divined that the Turkish Government is not so uniformly successful in quelling the disorder as has been claimed in Constantinople. The Albanians have always taken pride in preserving a certain autonomy since the fifteenth century, when their national hero, Scanderbeg, successfully attacked Ottoman rule. The mountain tribes are not at all in sympathy with the constitutional regime and the policy of national uniformity which the Young Turks are seeking to impose. Besides the racial differences, the religious question forms an important factor in the problem. The Catholic Albanians receive sympathy and possibly more material support from Austria and from Montenegro, while on the other hand the war cry of the troops sent out by the Turkish Government is "Who will fight and die for Allah and the Prophet let him march against the infidel mountaineers." Pope Pius X is reported to have conferred with the Bishop of Skutari over the situation. When the Pope requested the Bishop to preach peace to the Albanians, the bishop informed him that the Albanians had suffered so much from the tyranny of the Turks that they were determined to strike for justice at any cost. The Pope is said to have notified the Turkish Government that the creation of a nunciature at Constantinople would be impossible if the Turks continued to persecute the Albanian Catholics. So far the active outbreak has been confined to the northern extremity of Albania, but it is feared that the rest of the country may at any time share in the rising, for the educated

Albanians and the emigrants returned from America have radical and republican views. There are now about thirty battalions of Turkish troops in the region, together, assisted by a large force of Bashi-Bazouks or irregulars. The strength of the insurgents is unknown, since they divide into small bands and pursue a desultory warfare in the mountain passes, chiefly of ambuscades. Lately, however, they seem to have adopted bolder and more open tactics, and they have laid siege to the town of Tuzi, on the Montenegrin frontier, which was not long ago captured by the Turks. The efforts of the Ottoman Government to relieve Tuzi have so far been unsuccessful, for the expeditions sent into the interior for the relief of the garrison have been attacked and repelled with severe losses. It is reported that the insurgents plan a simultaneous attack upon Skutari, Ipek and Dibra. In several instances the Turkish troops have gone over in a body to the insurgents they were sent out to fight. The Governor of Skutari has resigned, ostensibly on grounds of health, and his place has been taken by Torgut Shevket Pasha, who put down the former rebellion in that region with great severity. It is announced from Vienna that the Austrian, Italian and Turkish Ambassadors have advised the Porte to make concessions to the Albanians rather than to attempt to put down the rebellion by strong measures.

The Moroccan Rebellion

The disorder in Morocco has increased to such an extent that foreign intervention has become necessary, and both France and Spain are dispatching troops to that country. For a month now the Sultan has been besieged in his capital by a coalition of Berber tribes and has only kept them at bay by the use of rapid fire guns on the bastions and occasional sorties by the cavalry. The Sultan's artillery is under the command of the French colonel Mangin, who was called to Fez on March 22 to take charge of the defense of the capital. Another force of 2,500 native troops was sent to his rescue from Tangier under Colonel Brémond, but has not been able to reach Fez, as it was attacked on the way by the Sheradas. The Sheradas were defeated with a loss of forty killed and eighty prisoners, but they still hung on the flanks of the military expedition. Further progress was retarded by storms of exceptional violence. The roads were impassable and the heavy hail wounded some of the troops and stampeded the horses. When last heard from about ten days ago Colonel Brémond's force was stuck in the mud and short of food, money and ammunition, and mutinous because they had not been paid. Reinforcements and supplies sent from Tangier had not succeeded in getting to him. The French can, if necessary, invade the country from three directions; from Tangier on the north, from Casablanca on the Atlantic coast, which they have garrisoned ever since the outbreak there, and from Ujda on the Algerian frontier to the east. But France is probably not anxious to undertake such a difficult and expensive task as the pacification of Morocco, even if given a free hand in it by the other Powers, which is doubtful. It is rumored, in spite of official assurances, that France and Spain are not in complete accord as to the policy of their joint action in Morocco, and that Germany is likely to interfere again if the French Government should attempt any advance movement. The jingo German papers call attention to the fact that Germany has greatly strengthened her diplomatic position and military power since the conference of Algeciras, and that if the independence of Morocco is to be destroyed Germany should get her share. The least she would claim, according to these papers, would be the three Atlantic ports of Rabat, Casablanca and Mogador, together with the hinterland pertaining thereto, which she needs for growing cotton. General Moinier, in charge of the French troops at Casablanca, will probably start soon for the relief of Fez with a mixed force of Shawia tribesmen and French soldiers, about 4,000 altogether, and expects to reach the capital about May 4. Besides the eighteen French army instructors, the Europeans now in Fez comprise seven Frenchmen, seven Italians, four or five Englishmen, three Germans and three Austrians.

The Grievances of the Mexican Insurrectos

[The following article is by an American, resident for many years in the heart of the Mexican revolutionary territory and at this moment residing there. He prefers not to have his name used.—EDITOR.]

HAVING lived in Mexico nearly half of my life, both as a child and as a man, knowing the language and the people of both nations almost equally well, I feel that I am in a far better condition to interpret the disturbed political conditions in this republic to its friends in the North, than the average newspaper correspondent who, after a sojourn of a few days at or near the seat of war, rushes into print and heralds to the world his private opinion as to the nature of the Mexican revolution and its causes. It is after having read some of these articles in recent metropolitan papers, so full of inaccuracies and unfair statements, that I have been stirred up to set forth the true conditions and the real causes of the present revolution, which, altho it may have at first seemed petty and at times been given an "opera bouffe" appearance, is neverthelss powerful and full of significance for the future of the Mexican Republic.

History is now being made in Mexico, and to us who live here and whose lives and interests are more or less closely bound up with the future of this country, the events now occurring are intensely interesting.

In its significance and importance this revolution as far transcends the numerous uprisings that were the scourge of Mexico two generations ago as the American Revolution surpassed the recent upheaval in Portugal. "Revolutions" used to be almost as frequent in Mexico as they still are in Central America, until, thirty-five years ago, the bravest and most able revolutionist of them all succeeded in placing himself at the head of the government, and has remained there ever since, a president in name, but a czar in reality.

Now, for over a generation Mexico has been free from the scourge of almost constant fighting; and, under the wise and statesmanlike leadership of Diaz, greatest of Latin American presidents and one of the world's notable rulers, the land of the Aztecs has progressed with astonishing rapidity, as all the world knows. It is universally conceded that Diaz's government, tho despotic in the extreme, ruling with an iron hand that has not hesitated at imprisonment and execution whenever it was deemed necessary, has been for the good of Mexico; because only thru such measures could such a strong, stable government have been established, and only under such wise leadership could Mexico have entered upon and enjoyed the most prosperous era of her history.

If that is true, if it is a fact that the material prosperity of the nation has been such as to astonish the world; if manufactures, railroads, mines, and industries of all kinds have been encouraged; if wealth has been poured into the country to aid in the development of its resources, until nearly a billion dollars has been invested by foreign nations in the last twenty-one years, why should there have been a revolution? Shallow thinking persons have said it was because a disgruntled candidate for the presidency wished to gain the seat of power at all costs; if not by ballot then by force of arms. Others have attributed it to an anti-foreign mania with the rallying cry of "Mexico for the Mexicans." Still others have said it was an uprising of the peon class aided by bandits and idle malcontents who are out only for plunder, and who hope to obtain a life of comfort and ease thru the subdivision and distribution of the large feudal estates in a veritable socialistic style.

None of these explanations comes anywhere near the truth. The causes of the Revolution are deep seated, and one must go back many years to trace their source. The three or four principal causes—the denial of the right of suff-

rage, the insolent and oppressive domination of the political bosses, the organic union of the executive, judiciary and legislative branches,—are all dependent upon the too long continuance of one man as president; and the refusal of Diaz to give up the reins of government, when over half of the people demanded it, was the immediate and preponderating cause of the resort to arms.

When I say that Diaz has been president too long, I do not mean to imply that he is not honored, respected and appreciated by his people; but his unprecedentedly long term of office has resulted in the establishment of the most powerful political machine ever known in a so called republic, and Diaz himself has become the most powerful political boss or "cacique," as we say in Spanish, that ever held sway in a so-called democracy.

"But," some one objects, "has not Diaz been one of the best 'bosses' that ever directed the destinies of a nation? Has he not been unselfish, seeking only his country's good? Did not Mexico need just such a ruler,—boss, czar, call him what you like,—to lead her in the path of peace, industry and self-development?" Yes indeed, but under his leadership Mexico has progressed to a point where her people are ready to begin to assume some of the responsibilities of self-government. What a splendid thing it would have been, if he had only seen that the times were ripe for him gracefully to step down from his "throne" amid the plaudits of the world, honored and respected by every one at home and abroad on account of his self-abnegation, this crowning act of renunciation, allowing some one chosen by the people to take the reins, while he could stand by, ready to advise and direct if it seemed necessary.

But instead of this, deceived in his old age by the flattery and adulation of those by whom he had surrounded himself, and to whose interest it was that he should remain in the president's chair, so that they could continue in their positions of trust and power, with the almost limitless opportunities of lining their pockets; deceived also by the respect and plaudits of the multitudes that appeared to do him honor while satisfying their curiosity, on his triumphal "march" from the capital to the northern boundary of the nation, where he was the cynosure of the eyes of the world on the occasion of his meeting with President Taft, he decided to allow himself to be "re-elected" for another term of six years, thus fastening upon his already restive and uneasy people the shackles of a system more oppressive and fettering than any to be found outside of Russia.

What is this "system"? What was its origin, and into what has it developed or degenerated? Let me explain. Diaz naturally had to appoint trusted and loyal followers to help him govern his country as he thought it ought to be governed, so he arranged that the governors of all the states should really be appointed by him, while nominally elected by the people. Each governor in his turn saw to it that mayors of every city and town in his state were men of his choice, and that even the men who made some pretensions to represent the people, their supposed spokesmen at the local seats of government,—the state legislators,—owed their "election" to him. The judges too were appointed by the governor; and thus we see that the chief executive of the state and the political boss in Mexico are one and the same. As compared with the "boss" that we are so familiar with in the United States, he is a person of far greater power and with much greater opportunities for graft and rascality than his American cousin; for his fellow-citizens have absolutely no means of dethroning him or of curtailing his power in any way, and in many instances the governors have remained in power for from ten to twenty years.

Under such a system and with the examples of their Spanish fathers before them, is it any wonder that graft honeycombs the whole government and flourishes with a tropical luxuriance? There is not even the semblance of a civil service system to check the evils of political patronage, which was getting to be such a nuisance in the United States before Cleveland's time. The local postmaster appoints whom he wishes; the mayor fills all the city offices; the judge decides what he pleases, unhampered by any

jury, and influenced only by his awe of the moneyed or political prestige of the persons under trial.

To reinforce what I have said regarding the evils of the rule of the "boss" in Mexico, I will translate at some length from an article that recently appeared in *El Pais* of Mexico City, under the title of "The Secret":

"Wherever a Mexican 'cacique' holds sway, his power is felt in four main directions: lands, water rights, fines and women. As soon as the cacique steals for himself the water of the village to irrigate the land which, but a short while before, he also stole, the citizens who find themselves reduced to misery or condemned to die of thirst, get together to plan a defense. A committee is named to present their complaint to the 'cacique' next above. The committee fails after receiving nothing but harsh treatment, and the matter is then put in the hands of the most popular 'tinterillo' or pettifogger, who leaves the citizens stripped to the skin in exchange for a very fair cudgeling which he gets on turning the corner of his house.

"The committee next hunt up a lawyer, a 'señorón,' a 'big bug,' of the kind that don't allow themselves to be beaten, who work miracles. To cover the costs each citizen makes a sacrifice, selling a burro or mortgaging a little piece of property; sacrifices permitted only by their deep indignation, and finally they manage to furnish fuel for the engine of law which is to destroy the immunity of the boss. The lawyer toils and sweats, and after all he too confesses his powerlessness.

"But hope is the last thing to die. A politician must be sought, a man of influence, a little finger of the governor; he must be talked to, his wife must be influenced thru the priest. Fresh sacrifices are made, those which appeared impossible at first. The politician gets to work, his wife too, as well as the priest. All to no purpose. In fine the boss turns out to be, as the lawyer said, 'more invulnerable than the sun.'

"At times it is not the poor, but rich ranch owners or manufacturers who initiate the holy war. The result is identical. The boss laughs at them all; with the greater glee the more powerful they are.

"The secret of this immunity is complicity. The boss 'higher up' dare not punish his inferior, because between the two there are the most horrible secrets. The latter has been the accomplice of the former in many pieces of dirty work, in many odious acts, and like all of his ilk he keeps his proofs. In reality he is a veritable tyrant over the one higher up He can laugh at him, the same as he does at the citizens, pettifoggers, lawyers, and little fingers."

I have devoted so much space to the evils of "caciquismo," because the oppression and practical state of slavery which has resulted from it have galled the feelings of the people more than anything else, and has been by far the most important cause of the present uprising. What recourse was there for the poor people but to resort to arms?

Perhaps the next strongest cause has been the oppressive burden of *heavy and unjust taxation,* tho it is subordinate to, and the direct result of, the political "system" just dwelt upon.

If our forefathers were justified in fighting for freedom from British rule, because of unjust but not oppressive taxation, how much greater justification have the Mexicans for taking up arms to obtain the right of suffrage and fair treatment by their rulers! Not only are they "taxed without representation," but they have been taxed to the limit of their patience. The proverbial patience of the Mexican citizen has been stretched to the breaking point, with tax upon tax, until the small shopkeeper—of whom there is one on every corner—the small farmer, the tradesman, have all been paying an amount of taxes which the average American or Britisher would not stand for at all. The stamp tax in the United States during the Spanish American war, on checks, tobacco, patent medicines and perfumery, was an enormous revenue producer, but was considered somewhat of an infringement on the liberty of American citizens, and was removed shortly after the war ended. Here in Mexico we don't mind putting stamps on every receipted bill, on every legal document and on all our checks. But what would an American farmer say, if every time he slaughtered a beeve, a pig or a lamb, he had to pay a license fee of from $3 to $5! What would the average shopkeeper or business man say, if he had to pay five or six distinct taxes: one on his capital, a license to the city, a percentage on his daily cash sales, a special tax on tobacco; and whenever he paid a city tax, he had to pay a corresponding state tax, and always 20 per cent. additional to the Federal government? Moreover, the tax levied on the small business man is always proportionately greater than that on the large business houses. All who own horses and carriages have to contribute their share, those who make their living from the transportation business having to pay

a larger tax than those who have carriages for pleasure; professional men have to pay from $5 to $10 a month; and so on down to the poorest citizen, none of them having any voice as to who shall govern them, so that the only wonder is that the people haven't risen in their wrath long ago!

The denial of the right of suffrage is a cause of the present revolution, which must be placed right alongside of the other reasons just mentioned. Always in the past it has been one of the transcendent motives for rebellion, and when suffrage has been denied a people who have felt that they were ready for it, they have had to wade thru rivers of blood before they have gained that sacred boon of democracy; and the citizens of modern Mexico will come to their own, even if it has to be in the same old way.

When Diaz first became president, the people were far from being ready to handle the ballot. It is estimated that at that time hardly twenty per cent. of the inhabitants were able to read and write. Even now, outside of the cities and larger towns, the proportion of illiterates has but very slightly decreased. But in the centers of population the efforts of Diaz to extend the public school systems, seconded by the altruistic help of religious bodies of all denominations, making a total of some 12,500 schools with 15,000 teachers, have accomplished a great deal. A striking proof of the raising of the general average of intelligence is shown in the increase of newspapers and periodicals of all kinds published now, as compared with thirty years ago. At present in the city in which the writer lives there are printed five or six daily papers of varying size, all very small compared with American newspapers in a city even one-third the population of this city of 35,000, but nevertheless very effective in stimulating the thought and opening the minds of the people. When the wife of a soldier, a member of the very lowest social stratum, can be seen reading a paper as she walks along the street, it shows that a very large proportion of the inhabitants of a city are able to read and do read at least the daily papers; and when that is the case, it is not long before the people begin to realize that they are not being treated rightly as compared with the citizens of real republics.

It has often been said, with great truth, that one of Mexico's greatest needs was the development of a large middle class, the very backbone and sinew of every nation that amounts to anything. A class that is neither poor nor rich; neither debased nor debauched, but that is educated, thoughtful, moral and ambitious. The class in which are to be found the professional men, the teachers, merchants, engineers, skilled mechanics, and the independent farmers. Such a class has been slowly forming, until now it constitutes no inconsiderable portion of the population; and it has been among the representatives of this class that the present wave of reform, and of rebellion against the existing form of government, originated. It is not true, as it was stated at the beginning, that the uprising originated among the peon and criminal classes, and that the revolution consisted merely of a few scattered groups of bandits out for plunder and pillage. Indeed, in view of developments that have taken place in the short time since this article was begun, it is hardly necessary to take the trouble to refute such a ridiculous statement.

The Revolution as a movement, and as an expression of the discontent of the majority of the citizens of Mexico with the present system of government, has assumed a significance that has called to it the attention of the whole world, and has already resulted in the first step toward radical reforms. I refer to the resignation of Diaz's entire cabinet, something that never before happened in the history of Mexico. It is more than likely that even before this appears in print there may be still more sensational developments, resulting, it is to be hoped, in the cessation of hostilities thru the instituting of practically all the reforms demanded by the people.

I cannot do better in closing my article than to quote the appeal made to President Diaz in an article by a prominent native physician, a typical representative of Mexico's middle class, who as a rule do not concern themselves with politics and who have not taken an active part in the armed revolution, but who nevertheless sympathize with it. The article

is entitled "A Plea for Peace," and it appeared in a leading local daily paper. The appeal to the President is as follows:

"Have mercy on thy people; concede them the justice they ask. Grant them free suffrage and the effectual separation of the judicial, executive and legislative powers. Take away the insupportable burden of 'Caciquismo,' which destroys all ambition, all dignity, all good sentiments; which corrupts the soul and fills the heart with rancour; which separates more and more each day the people from the government, the poor from the rich, brother from brother.

"It is in vain your interested friends and the 'officious' press try to tell you this revolt is of no importance, that it is caused by bandits who only want to rob and destroy, that a crazy interloper pretends to accomplish impossible utopian dreams.

"What is certain is, that the Mexican people are hungering and thirsting after justice. It is certain that the brave mountaineers and proud frontiersmen who are up in arms are not bandits; on the contrary, the majority of them are on a far higher level, intellectually, morally and physically, than are the masses of the central plateau of Mexico; and for that very reason have the ideals of democracy germinated in them.

"Also it is not true that the discontent is merely local. . . . Perchance the army may be able to suffocate with blood the blaze that has begun, but the sparks will reappear later over a greater area, and it will then be impossible to extinguish the conflagration.

"To delay an evil is not to remedy it; on the contrary, it is but giving it greater strength, pruning it, nourishing it, so that the disaster will be the greater when the explosion does come.

"Neither is it true that the leader of the political movement that is sweeping the country is an infatuated idealist unworthy of consideration. This 'crazy' man who today is known as Francisco I. Madero, and who in other circumstances has had more illustrious names, tomorrow will be known as—we know not what—but neither does it matter, because it is not persons who cause revolutions, much less who triumph, but it is principles and peoples; and it must not be lost sight of that the actual revolutionary movement is stimulated by principles which have been victorious on other occasions, and sustained by people already conquerors in many struggles."

Dei Antiqui

BY MARTHA HASKELL CLARK

WHERE did the old gods flee, when, long ago,
To virgin arms the Nazarene was born?
Where did they hide, when o'er that manger low
The Wonder Star proclaimed the holy morn?
Did they, with low-bent heads, unseen, unwept,
Creep vanquished from an unbelieving world,
And while the baby King, uncaring, slept,
Seek the gray mists that round Olympus curled?
So wise men say—and yet—and yet I know,
That swift, light-footed thru the silvered sedge,
Last evening when the April moon hung low
Above the beeches at the gray woods' edge,
I saw Diana pass, with jeweled bow.
And when the leaf-stirred, dew-wet dawn was young,
E'er the first sleepy chirp of birds began,
While still the dawn-flushed mists caressing hung
Above the silent pools—unseen of man,
I heard the first, sweet spring-song of the world,
Faint echo from the reedy pipes of Pan.

THE CATHEDRAL AS IT WILL APPEAR COMPLETED AND THE CHAPEL OF ST. COLUMBA.

H. P. G. P. M.

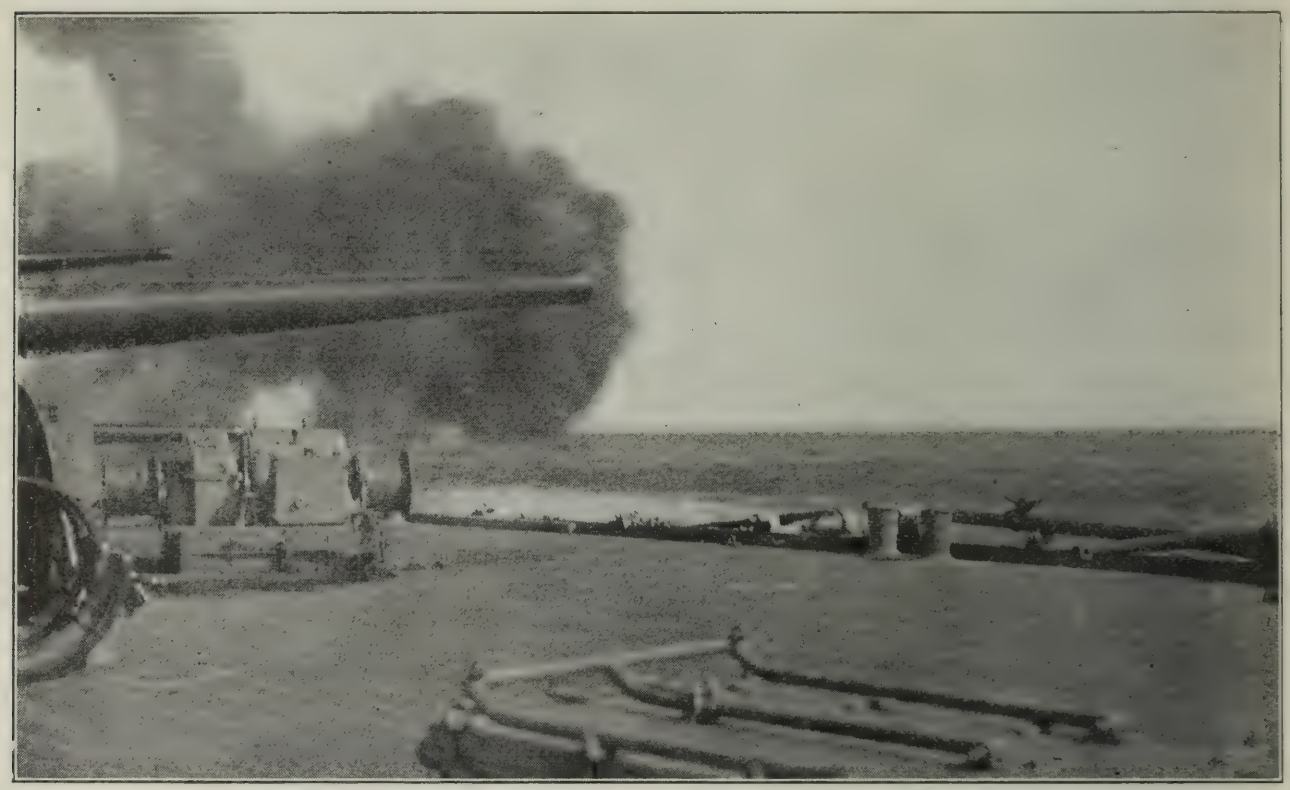
BY CHARLES NOBLE

[The author of the following article was on shipboard during one of the recent target practices of the North Atlantic fleet off the Capes of Chesapeake. H. P. G. P. M. is the navy slogan, "Hits per gun per minute."—EDITOR.]

ONE gray and sullen morning a few weeks ago you might have found the big sea-fighters of the North Atlantic fleet some miles off the Capes of Chesapeake, looking, as they rose and fell on a long heaving ground-swell, considerably more businesslike and grim than they ever do in North River.

A wee whaleboat, looking like a water-bug on the long slope of a big sea, comes sliding down into the lee of a lofty gray steel side, and two drenched and draggled individuals make shift, in fear and trembling, to scramble out, clutch the long sea-ladder, and climb to the quarter-deck. What is any number of sousings in the Atlantic compared to the chance to see a real battle? And if this isn't a real battle, it promises to come as near it as most of us have any desire for.

The enemy lies just astern, two long wooden rafts, set so close with masts, on which the targets are being spread, they look like two gigantic coarse-toothed combs tossing and tugging at their tow-line. As we take up the slack of that hawser and slowly head out to sea, four great gray shapes, in beautiful order, slip across our wake and stand away to northward. These are the first division to fire. Smaller and smaller they grow, until only a gray blur on the horizon. There is a little expectant murmur around you, and the gray blur resolves itself into four little flecks in a line. The battle is going to begin!



Of a sudden it occurs to you to glance at the innocent targets trailing serenely in our wake. Somehow they look uncomfortably close. Wouldn't it be better for all concerned if we were to let out a few hundred yards more line? Somebody ought to speak to the captain about it. You steal another look. Positively, they are nearer this time than they were before! Perhaps you were a trifle too ambitious to seize upon such a prominent position, clear out here by yourself on the open deck, just behind the official observers, who have to be here whether they like it or not. There is a nice, quiet, retired spot you remember noticing, behind that big steel turret. We can see just as well there, and it will feel much more comfortable and not so conspicuous. Too late! While you were watching those ships over there on the horizon your retreat has been cut off by a solid bank of interested spectators. All that is left for you is to take what comfort you can from the unconcern of the scorers. They don't *look* much worried, at least. That young officer with the binoculars, for instance, is actually whistling under his breath, and the tune, of all tunes in the world, is "Annie Laurie."

"Maxwellton's braes are bonny"——

A flash of light like a monstrous red eye winks out against the gray sky over there on the northern horizon. There is a little gasp from the group around you, and a clicking of stop-watches. The fight is on. You sternly repress a foolish desire to crouch down behind a canvas hatch canopy that would hardly stop a Jersey mosquito, but fail to repress a long, sudden breath and a traitorous feeling in the knee-joints. Even "Annie Laurie" gives place to the "Wearin' of the Green." "Oh, Paddy dear, and did you hear the——" An ear-splitting crash, a roar like the wings of an enormous quail, a vast column of spray leaps a hundred and fifty feet in the air just in front of the foremost target, and slowly subsides. You turn your head just in time to see another flash, there is another breathless wait, and with another crash and roar the target is hidden in spray and flying splinters. A little murmur of professional approval is elicited from the lookers-on, and a dull boom comes floating down the wind.

In another moment the battle is in full swing. The whole distant line vanishes behind the flicker and flare of broadsides, and ten seconds later the crash of falling shells merges into one steady uproar. The water on both sides of the targets

is torn into foam and beaten into geysers of spray. On both rafts the splinters and rope's-ends fly, but they were built to stand hard usage. The sea behind them is alive with skipping black objects, which you suddenly realize are armor-piercing shells that would snuff a man out like a candle. As pandemonium continues and somehow leaves you still alive and untouched, you begin to recover your breath and take an interest in the crazy antics of the ricocheting shells. But just then one—and only a six-inch, too!—falls short and goes skipping and whirring overhead. Well, at least you

"AN EAR-SPLITTING CRASH—THE BATTLE IS IN FULL SWING."

didn't duck any more promptly than all your superior professional friends did.

This battle doesn't last long, however. A few last scattering shots, the last geysers of spray subside. The sun comes timidly out from behind a good thick cloud, turning the sea to turquoise and the whitecaps to mother-of-pearl, and finds the targets somewhat battered but still in the ring. The humble civilian spectator is none the less inclined to believe that he would not care to be on a battleship, no matter how big, that might volunteer to take their place.

It is our turn now, and soon enough we have turned the targets over to somebody else, taken our place in column, and are heading away to northward.

The humble spectator is permitted to stow himself away in a compartment on the gun deck. Here all seems quiet and serene, but the compartments are conspicuously bare, the guns are trained out on the beam, and a row of shiny new-painted shells stands beside each shining steel breech. There are a few men lounging about, talking and laughing. This game of target practice seems to be getting to be an old story with the blue-jacket nowadays. Still you can feel an undercurrent of excitement somewhere beneath this elaborate blasé exterior. Abruptly breaks in a fiendish clamor of gongs, a bugle shrieks frantically, and quiet expectancy breaks up in a wild scurry of feet. Lines of hose leap across the deck with one well-directed jerk. Bang! go the big armored doors that cut the open deck into a row of little independent citadels. With a rattle of chains, up go the ladders to give a free sweep to the rammermen. Men spring up, thru the deck apparently, and swarm over the gun in furious, noiseless haste, setting telescope sights, trying the breech mechanism, running forward the loadin tray. The ammunition hoist clanks and

"TWO LONG WOODEN RAFTS, SET CLOSE WITH MASTS"

up come the long powder cases. The first charge is hustled into the tray, and the commotion dies as suddenly as it arose. Behind you comes the level voice of the young battery officer, reporting thru his speaking tube, "Fifth division ready, sir."

Then comes the long cruel wait. The gun's crew soon become restless as children, shifting their hands and feet, glancing sidewise thru the port. The battery officer alone remains impassive, hands in pockets, eyes apparently on vacancy—but only apparently, as the youngster finds who tries to sneak consolation in the form of navy plug.

"Load!" sharp as a pistol shot comes the order from the man at one side, with the telephone strapped over his ears. With a hiss of escaping air the breech swings open, the loading tray leaps forward with the swift precision of a machine. Clang! goes the shell home, Clash! the breech snaps shut. The big

"THE TARGET IS HIDDEN IN SPRAY AND SPLINTERS."

steel tube sways up and down, delicately as a pointing finger, as the pointers crouched on their little platforms follow the target against the heave and roll of the ship beneath their feet. Only a minute more——

The pointer says something—not polite—under his breath, and straightens from his cramped position. "What's the matter, Mac?" whispers the gun captain. "Schooner in the way," is the answer. And now we can all see thru the port the big hulking four-master that has come slouching across the very line of fire with her hands in her pockets, without sense enough, probably, to know the risk she has run. More than one pointer, you would be safe to say, would like to put a shell across her bows, just to scare her a little. But the navy can't afford to make itself unpopular that way, and she goes on her way unmolested.

After what seems like another hour of waiting the deck sways and trembles under your feet, a rush of air takes your hat off, the sunlight turns pale and sickly thru a cloud of golden smoke, and a tremendous roar announces that the twelve-inch have opened fire.

The innocent bystander yields to impulse, dashes across the deck, scrambles up two ladders and emerges in the open air just in time to lose his hat, his breath and his footing in the cataclysm of the first entire broadside. He finds a friendly wire stay, and hanging on for dear life, holding his breath between salvoes only to be half choked by gulps of powder fumes when the shock of discharge throws his mouth open, catching fleeting glimpses of shells, like monstrous, evil birds, in their long curving flight that ends in a swoop on the wee white targets —somehow manages to pull himself together to hear the gongs ringing "Cease firing," in vast surprise to find himself still alive.

Impressions? Your first is likely to be that target practice may be all right for the navy, but one experience is enough to last you for a long while. The next one is that any Fourth of July celebration is going to be a pretty tame affair to you in the future. You have a feeling that you ought to carry away something a little more definite, but somehow the whole affair is out of scale with anything you can bring your mind to. It is too big, too grim to fit in with ordinary everyday matters. But your final decision will be that it was "worth it."

BY HERBERT A. JUMP

PASTOR OF THE SOUTH CONGREGATIONAL CHURCH OF NEW BRITAIN, CONN.

THERE is a busy little city in Connecticut which has lately been undertaking a number of cosmopolitan experiments. Her latest venture is an attempt in six languages to make the city "as clean as an Easter Lily."

A couple of months ago the Men's League of the South Congregational Church, desirous of doing something practical in the way of civic Christianity, invited Prof. William B. Bailey, assistant professor of political economy in Yale University, to give a course of lectures on "The American City." These lectures were well attended, and, dealing as they did with actual facts, they attracted considerable newspaper notice, and resulted in the appointment of a committee to ascertain whether a "clean city campaign" would be wise. That committee consisted of a business man, a member of the City Council, a factory manager, a clergyman, a labor expert and a charity worker. Their diverse points of view gave value to their report which was both non-sensational and constructive. They declared their opinion that in the matter of clean streets and yards New Britain was no worse off than other cities, but that New Britain could be better off than

Spotless Town Crusade New Britain Conn.

Does your back yard look like this ?

If so, why not clean up before Easter Sunday?

Dirty yards cause flies, sickness, death.
Old tin cans hold water; water breeds mosquitoes.
Rotten garbage makes bad air, bad air makes weak bodies, weak bodies make big doctor's bills.

What you can do to help make New Britain a Clean City.

1. Take away all the ashes and dirt from your back yard immediately. Send your rubbish to the dumping ground.
2. Clean out your cellars, stables and sheds. Whitewash your cellar walls, fences and hen-houses.
3. Burn all rubbish that will burn. Clean your vacant lots and alleyways.
4. Avoid mixing ashes and garbage. This is against the law. You may be fined five dollars.
5. Refrain from throwing old paper, banana or orange skins into streets.
6. Plant some grass and flower seeds to make your home beautiful. Every house should have a little green grass and a few trees.
7. When you have cleaned up for Easter, KEEP YOUR YARD CLEAN ALL THE TIME.

The Board of Public Works, City Hall Telephone 77, will furnish information concerning teams and dumps.

This is the Program.

April 8 to 15, Spotless Town Week; everybody clean up.
April 9 Palm Sunday; all dirt from the winter carried away.
April 14, Fast Day, Holiday; all dirt carried away.
April 16, Easter Sunday; let us make New Britain a city that is

"AS CLEAN AS AN EASTER LILY"

JOSEPH M. HALLORAN, Mayor.
DR. HENRY T. BRAY, Health Officer.
AUGUST BERGSTROM, Sanitary Inspector.
HERBERT A. JUMP, Sec'y of Spotless Town.

she was. So a citizens' mass meeting was held, at which the Mayor and other city officials spoke and stereopticon slides were shown of some unsightly backyards which had been discovered. The result of that mass meeting was a polyglot municipal spring housecleaning.

The enterprise was christened a "Spotless Town Crusade." It was a picturesque title and caught the popular fancy. The whole city began to think of a new theme, viz., a clean city. The week preceding Easter was appointed as "Spotless Town Week." "Let us make our city spick and span for Easter to match the beautiful new clothes we shall be wearing on that day." So said the citizens, and they got to work.

The first move was the organization of an executive committee. Inasmuch as the Spotless Town Crusade was not a criticism upon incompetent city officials, but a campaign of civic education to aid enthusiastic municipal officers who were already doing all that could be done with their resources, the active co-operation of the heads of the city departments was enlisted from the start. Appreciation in the long run is a more potent regenerative method than muck-raking.

The Mayor became honorary leader of the movement, the health officer was acting chairman. A letter to the public was published in the newspapers asking all patriotic citizens to aid in the effort to make New Britain the cleanest city in New England. But the English language in which this appeal was printed is an inadequate tongue in a city where 80 per cent. of the population is foreign born, or of foreign parentage, consequently something else had to be done. And here enters that polyglot feature by which New Britain's experiment became unique.

In some stores with foreign names over the door unwonted literary activity suddenly began. A leaflet like that reproduced on page 885 was being translated into six languages for universal distribution thruout the city.

This leaflet was printed on yellow paper, suggestive of a quarantine flag. A German florist translated the leaflet into German, an Italian fruit dealer called a committee of his countrymen and they put it into Italian. The Swedish version was furnished by an editor, the Polish version by a priest and for the Yiddish edition of the leaflet the help of the out-of-town printer and translator had to be solicited. By means of this poly-lingual literature it was estimated that forty thousand out of the total population of forty-five thousand in New Britain could read the exhortation of the Spotless Town Crusade in their native tongue.

How were the leaflets to be distributed into the homes of the city? By a corps of messengers numbering nearly 10,000, namely, the public and parochial school children of the town. These boys and girls were organized into a huge Spotless Town League. Every member of the league was provided with a membership button in blue and white lettered with this inscription:

"SPOTLESS TOWN LEAGUE.
NEW BRITAIN."

They were urged by their teachers to clean up their own backyards and to help keep the streets tidy. A motto was adopted:

"AS CLEAN AS AN EASTER LILY"

A song was written which ran as follows:

"We're out for a Spotless Town Crusade:
Use a rake on your yard and lawn;
See to it that New Britain is made
As clean as a lily by Easter dawn."

Some "Ten Commandments of Spotless Town" were printed on red cardboard and a copy given to each member of the League. The commandments were as follows:

1. Don't throw anything on the sidewalk or street. Find a rubbish can.

2. Don't tear up paper and scatter it anywhere.

3. Don't let any piles of ashes or rubbish stay in your backyard.

4. Don't mix ashes and garbage in the same can. Pigs don't like to eat old coal or clinkers.

5. Don't fill the ash can or garbage can too full.

6. Don't chalk the sidewalk, fences, buildings or pavements.

7. Don't deface park benches, school furniture or any public property

8. Don't forget that horses love banana skins. A banana skin is not dangerous if it is inside a horse's stomach.

9. Don't do anything that will bring disgrace to the city where you live.

HAS YOUR TOWN BACKYARDS LIKE THIS?

10. Don't expect your city to become clean and perfect all at once. It will become an ideal city only when everybody does something every day to help make things better.

A further stimulation of interest among the school children was a Spotless Town literary competition. Three silver medals and three bronze medals were offered for the best contribution handed in on any one of the following subjects:

The Spotless Town Crusade.
An Ideal Backyard.
Descriptions of a Perfect City.
What does New Britain need?
What Boys and Girls can do to help the city.
What the European cities can teach us.
A Dream of New Britain in the Year 2011 A. D.

Essays, poetry, stories were poured in by ambitious aspirants for honors in the world of letters, and the task of the judges in assigning the prizes was far from an easy one. Meanwhile a sixth grade class in a school at one end of the city wrote a mail bag of letters to a class in another end of the city, and their letters were duly answered. The subject of the epistles was: "What I intend to do to help clean up New Britain."

When selected contributions were published in the newspapers from day to day, it was discovered that a deal of humor, some of it unconscious but most of it intended, characterized these literary efforts. One lad wrote,

"To make New Britain a healthier city we all have our share of work. We should burn up our waste, including old rubbish and the things that our ancestors used."

A girl writes,

"If I were one of those men who spit on the sidewalk, I would not do it. If we had company for dinner, I would keep the cuspitdor in the other room until we were thru eating."

The enthusiasm of the young wearers of the Spotless Town League buttons, moreover, was supplemented by direct appeals to the older citizens. The efficient corps of translators applied their polyglot skill to their placard:

I believe in clean backyards,
Do you?
Spotless Town Crusade.
"Let us make New Britain
As clean as an Easter Lily."

When these pointed reminders printed on flaring red cardboard blazed at a man from a window of every grocery store and meat market and saloon it tended to develop a tender conscience with regard to backyards. Still another form of advertising the crusade was a motto to be attached to the sides of express and delivery wagons:

We're working for	SPOTLESS TOWN	How about you?

This elaborate and variegated publicity campaign resulted shortly in an omnipresent awareness that New Britain was in the throes of a civic movement. When a conflagration brought out the fire department, the bonfire that caused the trouble was described by a reporter as a "Spotless Town" bonfire. When a snowstorm whitened the streets, the witty paragrapher had his joke at the unexpected sort of Spotless Town which arrived during the night. The fact that the city was being "cleaned up" gave a jeweler the chance of advertising that he was "cleaning out his stock at half-price." When everybody began to talk Spotless Town, it is not surprising that many a householder began to create it on his property.

Photographers did their part in molding a public sentiment favorable to the reform. This, however, was at the cost of some hard feeling from the property owners whose real estate furnished the subjects of the photograph. A member of one photographing party narrowly escaped being hit by a pan of garbage that was thrown down from an upper tenement. After "Spotless Town" was inaugurated another camera man from out of town engaged in taking pictures for an entirely different object, was pounced upon by an irate individual who suspected him of being an "ash-heap detective." He all but suffered physical violence before his innocence could be proved.

The photographs of unhealthy backyards were made into stereopticon slides and shown whenever an opportunity offered. The Common Council of the city enjoyed them at a private exhibition in the council chamber, citizens and school children also saw them, and not infrequently the localities were recognized. The theaters generously co-operated and thru Spotless Town week ran a series of slides at each performance. Pictures speak much more effectively than rhetorical description to the average man, and the New Britain Spotless Town photograph album was an important factor in the ultimate success of the movement.

A word as to the results. When Easter dawned, New Britain was not literally "as clean as an Easter lily," but a citizen whose duties enabled him to speak with authority on the subject declared that "New Britain had never in its history as a village or city been as clean as it was on the morning of Easter Day." Thousands of children of a score of nationalities had been awakened to the thought that they could do something for their city. For them the sense of civic responsibility had been born. Thousands of homes where the parents read no English received the first communication on a municipal matter that had ever been addressed to them in their native tongue. Hundreds of back yards and a dozen school yards possess today an orderliness and spotlessness that will not last to be sure, but that remains, nevertheless, an ideal in memory and a standard to be worked toward in succeeding years. And probably a solid half-acre of made land at the various dumps of the city testifies to the amount of refuse that has been transformed from noxious dirt into useful real estate.

NEW BRITAIN, CONN.

The Operatic Situation

Giulio Gatti-Casazza, the present manager of the Metropolitan Opera House, is an Italian who, while he has a high opinion of Verdi, nevertheless thinks Wagner the greater of the two and accords him more performances. During the season just closed operas by Wagner were given thirty-four times. Puccini came next with twenty-nine performances, followed by Verdi with twenty-six. The fourth place belongs to Humperdinck, whose charming new "Königskinder" was the star opera of the season, thanks to its intrinsic merits and its big cast, headed by Geraldine Farrar. It was sung eleven times. Puccini's new opera, "The Girl of the Golden West," came next, with nine hearings, and third in the order of popularity was Puccini's "Madama Butterfly," which was given eight times. Fourteen different operas by German composers were presented, the same number by Italian composers, and ten by French, including those given at the Metropolitan by the Philadelphia-Chicago Opera Company.

Caruso did not sing during the last ten weeks of the season. Whether he will be able to appear next winter no one knows. His European dates for spring and summer, including those scheduled for the exhibition at Rome in June, have been canceled. Reliable information as to the cause of the trouble cannot be obtained; the latest rumor attributes it to a rheumatic condition of the throat which impedes his efforts to use the vocal cords. His enforced absence from the Metropolitan was not without compensation; it gave our own admirable tenor, Riccardo Martin (whose first name owes its form to the fact that he first made his reputation in Italy), an opportunity to show that he could do most of the Caruso rôles to the complete satisfaction of the public and the critics. With Caruso out, Geraldine Farrar became the regnant queen. Next to him she always draws the biggest houses, and for the concluding week, to ensure a brilliant close, she was called upon to appear three times—in rôles which revealed her remarkable versatility. It would be difficult to name three more utterly unlike than those she sang and acted during that week: the Goose Girl in "Königskinder," Ariane in the Dukas "Blue Beard" opera, and Tosca. The first of these she sang in German, the second in French, the third in Italian. Gatti-Casazza, fortunately believes in the principle of having each opera sung in its original language, and nearly all of his singers are polyglots; yet no other artist in the company could have shown the same perfection in parts so unlike as those Miss Farrar sang.

"Ariane and Blue Beard"

One thing, unfortunately, Mr. Gatti-Casazza has little faith in, and that is French opera. He takes every opportunity to express his opinion that, with the exception of "Carmen" and "Faust," there seems to be little call for French opera in America. He forgets the triumphs won by Oscar Hammerstein with "Louise," "Pelléas et Mélisande," "Samson et Dalila," and several of Massenet's operas, notably "Thaïs" and "The Juggler of Notre Dame." However, in the list of novelties provisionally promised by Mr. Gatti-Casazza for next season there are several by Frenchmen—Charpentier, Leroux, Ravel; and it must also be placed to his credit that he has given the patrons of the Metropolitan four opportunities to see and hear one of the latest Parisian successes, Paul Dukas's "Ariane et Barbe-Bleue."

He heard this last summer in Paris, with Toscanini, and both manager and conductor were so much impressed that they promptly called on their prima

donna, Geraldine Farrar, who also happened to be in Paris, and forthwith made arrangements for the production of the opera in New York. They did this with some misgivings; for, while they themselves, as musical experts, were greatly interested in this fantastic opera, they did not feel sure that the American public would like it. Fortunately the public did like it; so large were the four audiences that it was evident it might have been repeated four times more had it been produced sooner; but its many difficulties had made necessary its postponement to near the end of the season. It will undoubtedly be revived next season; so will "Königskinder"; but "The Girl of the Golden West" is not likely to be given again unless Caruso returns. Mme. Destinn, who sang and acted the part of the Girl so admirably, is not anxious to be heard in it very often, as it involves a great strain on the voice.

Several "Blue Beard" operas were composed before Dukas's—by Grétry, Offenbach, and others; but his is the most fantastic of all. It is a setting of a play which, there is reason to believe, Maeterlinck deliberately planned and wrote as a libretto. For a purely theatrical production without music, it is too deficient in incident; to the opera composer it offers effective situations and opportunities for "atmosphere," and of these Dukas has made excellent use.

Maeterlinck's "Blue Beard" does not, like the monster of the medieval French legend, murder his disobedient wives; he simply immures them in the vaults beneath his castle. Five have already suffered this fate when the sixth bride, Ariane, comes along. She has heard of her predecessors, is convinced they have not been murdered, as the peasants tell her, but makes up her mind to find out. She gets seven keys, one golden, which

BLUEBEARD UNBOUND BY HIS SCORNFUL SPOUSE.
His Sixth Spouse, as it happens. The seventh lady is only a nurse. Geraldine Farrar, as Ariane, is the dominant figure in the illustration—also in the Dukas-Maeterlinck opera.

she must not use, the others silver, the use of which she leaves to the nurse, who opens in succession six doors in the semicircular wall, and each unlocking is followed by a shower of jewels—amethysts, sapphires, pearls, emeralds, rubies, diamonds. Ariane at last discovers the golden keyhole, in the diamond vault. Using her key, she enters, and from far below comes the melancholy chant of the imprisoned wives. As she listens Blue Beard enters, chides her for being disobedient, like all the others, and tries to drag her away. The nurse's screams bring in the peasants in an ugly mood, and Blue Beard draws his sword; but Ariane dismisses her would-be protectors calmly with the words: "What do you want? He has not harmed me."

In the second act, in the absence of Blue Beard, Ariane and the nurse descend into the vaults, discover the wives and, after losing their way because a drop of water has extinguished their lamp, Ariane smashes a window leading to a garden by the sea and they all escape into it. In the final act Ariane teaches the five wives how to beautify themselves. Blue Beard returns with a bodyguard of negroes, fights the peasants, is wounded, and brought in bound. Ariane cuts the ropes, tends to the wounds, and then, saying good bye, invites the other wives to follow her; but they prefer their tyrant to liberty and no husband.

It is possible to regard Ariane as the "new woman" vainly beckoning her benighted sisters to follow her to freedom. But it is not probable that Maeterlinck had any such symbolism in his mind; nor is there anything in the music to suggest it. Dukas's score is subtle, piquant, and thoroly Parisian; but it is not so Debussyan as reports led one to fear. There is much more melody in it than in "Pelléas et Mélisande," and Dukas is not averse like his predecessor, to the use of dynamic contrasts—of full orchestral outbursts alternating with softer episodes. The music accompanying the tumbling out of the jewels becomes more and more brilliant, till it culminates with the diamonds. Another splendid climax is the breaking of the window leading from the dungeon. Thruout the score there is ever present a true French esprit and sparkle. But to take all this in, one must hear the opera several times. To those principally concerned in its performance, Geraldine Farrar and Arturo Toscanini, it was evidently a difficult task, undertaken with intense enthusiasm, and they had their reward in the plaudits of the public. The other parts are chiefly decorative; Blue Beard has only eighteen bars to sing.

"Quo Vadis" as an Opera

The Philadelphia-Chicago Opera Company also contributed a French opera to the Metropolitan repertory—a setting of Sienkiewicz's popular novel, "Quo Vadis," by a young composer named Jean Nouguès. Musically it is far inferior to the Dukas opera; there is plenty of melody, but it is usually commonplace. Harmonically, the score is surprisingly free from the influence of the latest Parisian school, as presented by Debussy, Ravel and Dukas. Much of it is mere circus music, but that, as it happens, is not always out of place, for the second scene of the fourth act is laid in the Roman circus, where Nero and his court and the populace feast their eyes on the martyrdom of the early Christians. At the Metropolitan performance the supposed fight between the giant Ursus and the bull onto whose horns the beautiful Lygia has been bound was carried on out of sight; but when this opera is performed in English, next season, thruout the country, there will be a live bull and real roaring lions in the circus act.

Thruout the opera the scenic effects are remarkably fine, and it is on these and on the play that "Quo Vadis" will have to rely for its success. Particularly picturesque is the scene of Act III, in which one looks up from water level at a massive stone bridge over the Tiber, down which boats are sailing. When the opera goes on tour the cast, of course, will not include such prominent artists as Mr. Dippel provided, among them Alice Zeppilli as Lygia, Lillian Grenville and Marie Cavan as the beautiful slave girls, Huberdeau as St. Peter, Dufranne as the Greek spy, Chilon, Guardabassi as Vinicius, and, greatest of them all, Maurice Renaud, who, as Petronius, the Arbiter of Elegance, dominated the whole opera

and once more proved that he is the greatest of acting baritones.

Next season, unfortunately, Mr. Dippel and his excellent company will be able to give only six performances in New York for the reason that its Philadelphia appearances will be spread over two different periods, the first of which will occur before the opening of the Metropolitan in New York. Among the new artists engaged by Mr. Dippel is Maggie Teyte, the young English soprano, of whom great things are expected. Mary Garden is to appear in "Carmen" and in Massenet's "Cendrillon," possibly also in "Aphrodite."

Of the Metropolitan's singers nearly all have been retained and it is likely that Tetrazzini will be heard too. A specialty is to be made of ballets performed by a new Russian company. Of the novelties under consideration the most interesting in Moussorgsky's "Boris Godounoff," which has had much success in Russia and Paris; but it is difficult to see how it could be done here effectively unless either Chaliapine or Renaud is specially engaged for it.

The Close of the Exhibition Season in New York

With only the Water Color Society to exhibit, the season's art activities in New York are over as far as the public is concerned, and a general survey of its accomplishments and tendencies is possible. These have been rather more noticeable than were those of last year. All over the country the permeations of the work of the societies interested in broadening the influence of art on American life are having visible effect. New museums are opening in many of the smaller cities, and many good things are being acquired for them by gift or purchase. Traveling exhibitions are visiting many towns that have not before had an opportunity to see the works of the men living in the art centers, and knowledge that such exhibitions can be held in places far from New York is spreading. The quality of the work shown thus is likely to improve as inland appreciation grows and artists become socialized to the extent of suffering patiently under the trials of frame breakage and travel risks to the pictures themselves. Architects are harvesting orders from cities only just growing up to a sense of civic pride, and the sculptural firms are decorating these in ever-increasing numbers, not always wisely nor well, unfortunately. Every American city has to climb upward to real appreciation of fine art by way of avenues bordered with mediocre to bad works; yet perceptibly we climb.

At present the group of unselfish men who form the Municipal Art Society are showing at the National Arts Club the aims and results of another year's struggle to guide necessary improvements in ways good as well as utilitarian. The exhibition includes studies for works ranging from a noble plan for the treatment of the river front of Riverside Drive in its entire length, including a stately water-gate for the city, to designs for all kinds of street lamps—several of which are graceful and adequate to a degree not hitherto reached. There are new letter boxes, made by the Tiffany studios, in bronze, which will make correspondence easy by supplying the necessary stamps, even at midnight. The several bridges of the future New York are much more massive and monumental than those already finished—especially the beautiful Henry Hudson Memorial Bridge at Spuyten Duyvil. Even the dumping piers for the Street Cleaning Department are to be sightly.

The spreading of the city out over Long Island receives consideration in the plans for "Forest Hills," a model village designed by Grosvenor Atterbury for the Sage Foundation Company. These drawings were among the most significant shown at the Architectural League also, for it is of little importance that the country homes of our wealthy few should become truly beautiful, rather than luxuriously ornate, when we consider the advance made in housing the millions fitly, and giving them places wherein to bring up new generations. Our American city environs are too hideous to be endured much longer, and these first steps in wise planning for large groups of simple homes, with the gardens that should be considered necessaries, not rarities in the lives of city children or

children of the suburbs, are delightful signs of the times; signs of the intimacy between a living need and a living art in a period of awakening.

The decoration of the interiors of the public schools is also thought of in this year's Municipal Art Exhibition, especially in regard to the new Washington Irving High School in Irving place, which is to be a model of all that a school should be hygienically, and artistically, too, if the necessary funds for carrying out the society's plans for its decoration are raised.

Independents and Others

The irruption of the so-called post-impressionism in art has been a notable feature of this season, best exemplified by its archangel, Picasso, at the Secession Gallery after a series of echoes of his ideas at the same place by Max Weber and others which make Cezanne, even, look academic! It is quite hopeless to describe the works of these men, and even good reproductions of their work would be entirely too material to convey any idea of the attenuated charm when they happen to have any of that quality in spite of themselves, and would expose them to suggestions that no sane men would or could perpetrate such atrocious malformations and disharmonies except as practical jokes. Nothing would be easier than to criticise them in what one cannot help calling the cant of their admirers. They take impressions from nature, analyse, develop and transmute it—into what? Certainly not something for the pleasure of the eye. Here is a wonderful chance for empirical psychologists. Pablo Picasso "does not limit himself to taking from an object only those planes which the eye perceives, but deals with all those which according to him constitute the individuality of form; and with his peculiar fantasy develops and transforms them, and this suggests to him new impressions, which he manifests with new forms, because from the idea of the representation of a being a new being is born, perhaps different from the first one, and this becomes the represented being. Each painting is the coefficient of the impressions that form has performed in his spirit," etc., etc. Problem: find the form in the befogged fire-escape that results from the process described by his friends. Picasso probably does have his weird delights in working this way, but why show the results? Yet we may all live to see great decorative art grow out of this abstract work which at present is too deeply contaminated with a sort of examination of conscience in the field of impressions to be a pleasure in the world, and unfortunately, too, the quicker result will be a flood of superficial imitators of the sincere men in the movement, for quite shallow brains can produce marvelously like canvases in this cult by going off at a new tangent from the beaten track.

Twelve men of our own, some of whom receive undue attention thru their association with the rest, have been showing paintings and drawings in the rooms of the Beaux Arts Architects in Thirty-third street, and, like similar groups in recent years, have received the name of "Independents." Certainly there were more interesting personalities here than one found at the Academy, and the bad lighting of the room was a pity, as many of the pictures were dependent on color perfectly seen for their best effects. Arthur B. Davies was the real giant present, tho, again, he is apparently in a stage of transition. He showed sixteen poetic and astonishingly individual works in oil and seven drawings, and, as usual, is appreciated only by the few. Rockwell Kent, a virile, open air spirit, is growing rapidly, and suggests possibilities of the healthiest kind for American art. George B. Luks, Maurice Prendergast and Homer Boss have no progress to record. Glenn Coleman does well what Jerome Myers does supremely—the streets of New York. John Marin is slight, but rarely poor, while Alfred Maurer, John McPherson, Julius Golz and Guy Pene du Bois are second-class men in the movement so far. Marsden Hartley had some new suggestions of force in the matter of eliminating all the non-essentials, but the general impression of all the works except those of Davies and Kent was that the artists had little to offer beyond tricks of craftsmanship as short cuts to effectiveness.

The Japan Society's Exhibition

Nothing Occidental would so soothe the troubled spirit of the habitual exhibition visitor after the mental unrest induced by post-impressionism as the beautiful collection of old Japanese prints which will be on view in the Fifth Avenue Building until May 6.

Here one can see bare gray rooms with stone floors made satisfyingly beautiful without furniture of any kind, by the widely spaced treasures from the hands of nearly all the best masters of design for wood block printing. Moronobu, the great seventeenth century painter, first to design for the printer, is represented by four rare examples. By the founder of the Torii line, Kiyonobu, are some glorious examples of pure decoration—especially that print of the actor Hanya in a woman's part seated upon a tree in blossom. Here the darkened paper lends something to the effect. After colors were introduced by Masanobu in the early eighteenth century, and further developed by Harunobu after 1764, prints, while losing something in breadth, gained in intimate interest and were certainly still exquisite in the time of Kiyonaga, whose finest prints were done between 1780 and 1790. By Harunobu is a lovely print of two lovers kissing in a palace, which seems to refute a statement often made that the kiss is unknown in Japan. The later masters, Utamaro, Toyokuni, Hokusai and Hiroshige, are all represented, as well as many less well known to us, but all so good that only the presence of the very greatest puts them into a second class. New Yorkers have not before had such an opportunity for increasing familiarity with the splendid and steadying art of Japan in this form.

Black and White Work by Haskell

It would be difficult to find a more exact antithesis to the works of Picasso and his like than is shown in the productions of Ernest Haskell, now at the Berlin Photo Company's new gallery at 305 Madison avenue. Haskell's work takes years of patient toil, and the result is certainly beauty, even if the toil is occasionally too apparent. The shade of Whistler disputes with the older Leonardo for the affection of this artist, but it is good to see such love of the crafts that have black and white to work with in these days of the happy accidents magnified into works of art. There are etchings, monotypes, lithographs, drawings in pen and ink and silver point—portraits among them all, delicate and good. No such pen and ink work is to be seen nowadays except in the drawings of Herbert Crowley, who has a more original mind than Haskell, but who could not surpass his portraits of the great trees for faithfulness to detail combined with decorative verity. Crowley's early works were reproduced in THE INDEPENDENT some years ago, and more recently the *Review of Reviews* has rediscovered this little known genius. Haskell's delicate initials and decorations have also occasionally been seen before, but it is good to have another and more complete reminder that the best traditions are never entirely dropped from the art world.

Sculpture

The growing interest in sculpture, especially in small pieces, has been marked by an increased output during the year, or possibly, to put it the other way around, the sculptors, always laboring under the difficulties of great expense in putting their works into final bronze or marble, are increasingly working in small sizes and asking our interest in the result. There is little to note here of any great attainment with this increase in the number of works. Miss Eberle has the freest individuality and possibly Solon Borglum the strongest mastery among younger workers. Chester Beach's work is dangerously near prettiness. The most recent issue of the Society of Friends of the Medallion is a medal of St. Brandon, a Celtic voyager to the West of the sixth century, who came to a land very probably in the American hemisphere and whose personality has been imagined with warm interest in a vigorous design for the obverse, and the spiritual allegory of his life conveyed in a reverse of great beauty and delicacy by the sculptor John Mowbray-Clarke.

A Boston Drama

Not always need we confine ourselves to New York City in writing of American plays. Certainly it is always a delight to happen upon an unexpected masterpiece in an out of the way picture shop, or a rare book in a village emporium. The lower price is not alone in producing its effect. So it is with the playhouses. In the case of the Castle Square in Boston one must remember, too, that here is a survival of the old-fashioned, overworked stock company. At that theater, in spite of its down-at-the-heel environment, Boston audiences of a type not looked for in houses where 50 cents rents an orchestra chair have for two months crowded two performances daily.

The play is called, for some reason, "The End of the Bridge." It has for author a young woman, Miss Josephine C. Lincoln, a special student at Radcliffe College, and a pupil of Professor Baker. But all this, as also the fact that the author won with her play a prize of $500 offered by the "leading man" of the stock company, Mr. John Craig, is less significant than the piece itself.

Like Augustus Thomas's "As a Man Thinks," which we reviewed last month, "The End of the Bridge" has a physician for its hero. This time, however, it is not a Jewish physician, but one who is chiefly remarkable for his intentness upon his work—which is a good work. His specialty is neurasthenia; and when one of his patients, a young woman of breeding, falls prey to the delusion that she must wed her physician, he gives up an unusual opportunity for professional advancement in order to save this case. This means marrying the lady, from a sense of duty purely professional. In due time he cures his patient, one may add. And, as this is an American play for an American audience, it goes without saying that he changes his mind about securing a separation: for must not it end happily and therefore romantically?

The theatricality of the play-making by Professor Baker's pupil is partly disguised for us by the manner of the acting: admirably subdued and temperate. Mr. Craig as the unblinking, unsmiling physician was faintly reminiscent of Mr. Gillette. Besides one or two excellent "situations," the play offers a good bit of child-painting, and it is the waif whom the physician has befriended that ultimately brings benefactor-physician and patient-wife together. This child-part is excellently acted by a young woman whose age does not disqualify her from acting on the Massachusetts stage, where the child labor agitation has resulted in the framing of such strict legislation against the children of the stage that many of the more interesting recent plays—"The Blue Bird," for example, and "The Piper," this last a play by a native of Cambridge—cannot be presented in a Boston playhouse. There is no loss in the present instance, where a seventeen-year-old acts thirteen to perfection. But it remains a little ludicrous that the most poetic of the year's plays, and Eugene Walter's sincere, however cynical, "Easiest Way," should for one reason or another be excluded from Boston; while debasing musical comedy (so-called), and farces for which no excuse can be found in either art or reason, crowd the theaters there, and complete the vulgarizing of the population.

One More Dramatic Season

Reviewing the dramatic year (strewn with wrecks and ruins) social comedy by American playwrights is what we miss. Adaptations of French drama we have had—and no marked successes in this department unless one counts the light musical farce, "The Pink Lady"; tours by Herr Possart and Sarah Bernhardt; revivals by William Gillette and Ethel Barrymore of their old triumphs; Shakespearean revivals by Marlowe and Sothern, and by Robert Mantell; a delightful play of the "reminiscent" sort, fragrant of the eighteenth century—Mr. Parker's "Pomander Walk"; two revivals of "Vanity Fair" plays; "Chantecler" in unbecoming English dress, and likewise "The Blue Bird"—a New Theater triumph; "The Piper"—another success at the same playhouse, and likewise a piece of fantasy, poesy, and charm; imaginative plays in prose by the Americans, MacKaye and Knoblauch—neither of them successful; a

AN AMUSING FARCE OF THE CONFIDENCE GAME: "GET-RICH-QUICK WALLINGFORD."

hybrid play of "Everywoman," that pleases the public better than the critics, to whom it seems a hodge-podge—all these things and many more have been ours. But where has been the dose of satire which we chiefly need—intellectually, socially, morally? We have some of it, in most wholesome form, in Leo Ditrichstein's adaptation of a German play, "The Concert"—in which the adapter himself plays the self-centered musician—but enough of adaptations! Our native dramatists seem to be too busy making imitations of imitations, and picture-plays ("Thais" —alleged to be "adapted" from Anatole France—is a case in point), to observe, record and criticise the life about them. It has been unfortunate that the New Theater enterprise was undertaken on a scale of great expectations: a smaller auditorium would not only have saved the founders very considerable losses, but might also have favored the production of just the kind of comedy of which we get too little in New York. It is disappointing that the New Theater should, this season, have encouraged unclassical revivals and spectacles rather than contemporary plays of ideas. When the *new* New Theater has been erected we shall see whether the stock of "intimate" comedy cannot be boomed.

The trouble is, however, that before you act plays you must write them—or get some one else to write them. It is their unspeakable crudity which impresses us in most recent attempts at social comedy on the American stage—next to the rareness with which it is attempted. Just as when our playwrights attempt so-called realism they attain mere sensationalism (as in "The Boss" and "The Deep Purple"), so in attempting comedy they arrive at something a little short of farce. Farce may have been far from their intent, but nimble actors will play comedy in that key to save it from catastrophe. So it is with that new play by a new dramatist: Harry James Smith's "Mrs. Bumpstead-Leigh."

His play is, indeed, a satire upon snobbishness, vulgarity and hypocrisy; also a satire upon a woman ashamed of her past—or, rather, of the source of her millions—and upon the shallow folk with whom she comes into contact. One cannot altogether blame the lady herself, for Mrs. Bumpstead-Leigh's father was old Jim Sayles, patent medicine king of

Missionary Loop, Indiana. Mrs. Bumpstead-Leigh has done wonders with her mother (Mrs. De Salle now) and sister, and imposes on Long Island swells with her English graces and hyphenated name. If she is ultimately "exposed" as a social adventuress, this is not by any outsider, but by her sister, who can no longer live a lie. She has taken in Pete Swallow, a tombstone salesman, formerly of Missionary Loop (and her lover); but her own sister's honesty is too much for her. Even so, her sister's honesty is turned to excellent account; it proves unquestionably the best policy.

The defects of Mr. Smith's piece are obvious; he has produced a magazine story in dialog form rather than a play; his play is thin and its machinery creaks; the characters all indulge in speeches of inordinate length. Mr. Smith is the "gifted amateur" rather than a real playwright. Yet "Mrs. Bumpstead-Leigh" is uncommonly fortunate in its interpreters: chief among whom are Mrs. Fiske and Mr. Dixey. Significance it has not except that thru the acting of it (notwithstanding occasional overacting) is demonstrated the sufficiency of our actors—if Mr. Smith or someone else would only give them something worth doing.

Our disappointment in such a play as this is not due to our taking pleasure only in "strong" plays. We did not fail to enjoy "The Concert"—and we should probably have enjoyed the fantastic "vehicle" for David Warfield, "The Return of Peter Grimm," had it condescended to visit New York. We enjoyed May Irwin in George Ade, last season—or was it the season before? Nor do we frown when a competent company acts the Chester-Cohan play of confidence-gamesters "Get-Rich-Quick Wallingford": an excellent example of what Mr. Eaton calls the "comedy of bad manners," frankly "low-brow" and unpretending. Yet one would like to see our aspiring playwrights successful in writing what they try to write—as successful in their line as Mr. Cohan is in his. "Then the play took a drop into farce, and there it remained until the end." That is a common sentence in dramatic criticism nowadays. The last time it was used some one was discussing the play with which Grace George opened The Playhouse—a new theater of uptown New York, under the Brady management. The piece was "Sauce for the Goose," by Geraldine Bonner and Hutcheson Boyd. But it really is not worth discussing; it is only another Dumas fils play, more than twenty years after. And it too is neither fish nor flesh.

True social comedy is not so possible in our times as it was in Molière's, you will say. Yet our life is full enough of tears and laughter. The absurdity of it is frankly conceded. It is, you say, more than ever complicated; and one can't expect to have dramatists who will sum it all up in a few acts. But we are not so complicated as you like to think.

New York City.

Do It Now

BY MAURICE BROWNE

Three crows sat in a withered tree,
(Rain and storm and windy weather)
And up spake the eldest of the three:
"Lying yonder what do I see?
"Ah! The rich red flesh and the eyes for me."
(Soonest begun is soonest ended).

Then up spake the second carrion crow,
(Rain and storm and windy weather),
"For me the skin and the skull. I know
There'll be little left when away I go."
(Soonest begun is soonest ended).

Then up spake the youngest; he was small,
(Rain and storm and windy weather)
And a novice at such fine festival:
"Aha! the bones are the best of all."
(Soonest begun is soonest ended).

But a kite came up and chased them away,
(Rain and storm and windy weather),
And he feasted long and he feasted gay,
And he chuckled: "There's none to say *me* nay";
And he left not a scrap at the close of day.
(Soonest begun is soonest ended).

Perpetual Endowments: Taxation Without Representation

BY THOMAS C. HALL, D.D.

Professor of Christian Ethics in Union Theological Seminary.

IT should be fairly faced by thoughtful persons that all endowments are taxation of the community without representation. Interest must be earned by somebody, and in the last analysis the community pays the sums that go to all endowed institutions.

The man of wealth who dies and leaves his fortune to some college or church leaves as a matter of fact only the legal right of entrance upon some industrial opportunity, for which then the worker pays in perpetuity a percentage of his earnings to the college or church. It may be land, or a railroad, or a mine or an organized industrial enterprise, but whatever it may be neither the testator nor the college or church produces the wealth that is paid over year by year; living hands must earn it, and what is paid over is thus a tax upon the living dictated by the dead.

As long as the man of wealth is living the returns he gets cannot always be strictly divided between the wages of service and the wages of ownership. But it is obvious that the dead can no longer earn, and that the interest of endowments cannot come out of the earnings of service on the part of the dead; they must come out of ownership, or rather as the price the owners pay for entrance upon the industrial opportunity *owned* now in so far by the inheriting church or college.

When a family inherits the same thing is true, but the issue is complicated by the fact that family inheritance may include farther service of supervision and management. Whereas endowments must generally by law be invested in such securities as preclude management by the trustees.

Once the real significance of endowments is grasped there arise a multitude of most difficult social, economic and ethical questions. The English Parliament has recognized in its interference with endowments the superior claim of the needs of an existing generation over the wishes of the dead. And in times of revolution the claims of ownership have been entirely pushed aside. But this generation is not yet ready to deny private ownership of the industrial opportunity nor to dispute the right to hand down that ownership under legal forms. Various statutes, however, in our own land limit the amounts, and prescribe the conditions under which, churches and benevolent associations may inherit. How much property an educational body may hold is generally signified in the charter, which is thus only a legislative right. But we are going to face evils and difficulties in this country before long whose magnitude it is now hard to guess, but against which the present restrictions and safeguards of inheritance are patently insufficient.

For instance, in New York City churches and educational institutions pay no taxes, save special assessments for improvement purposes, and in the course of time church sites have become enormously valuable. All members of the community have created by co-operative living together those values. No doubt the institutions have also helped materially in this process. But Jew and Gentile, Protestant and Roman Catholic have all worked for the raising of the site value, and then the church perhaps sells its property. It would surely be obviously only justice if a portion of the increment, earned in common, be distributed among the other earners—i. e. the community.

It is not correct to speak of "unearned increment." Any institutions that the community has freed from taxation must be assumed to be "earning," *i. e.* adding to the product of the community's labors. The distribution of all earnings is mere guesswork, and is dictated by social expediency. As educational institutions, including churches, do not "earn" in the shape of wringing material returns from the industrial opportunities, the community has generously freed them from taxation, but when they sell the land which the community has co-

operated with them to render valuable, then surely is the time when the real relationship between them and the community might be realized in rendering back this increment, in part at least, to the co-operating community.

Moreover, as the true nature of endowment becomes recognized, surely the feeling will deepen that the only justification for taxation without representation is the indisputable character of the communal service rendered. And that when any institution, church or endowed school ceases to be commonly serviceable the moral obligation to continue the support also ceases. We shall thus see rising a demand for close communal supervision of all endowments, and that all testamentary restrictions will be, if necessary, brushed aside should they interfere with communal rights. Thus the equity of the treatment of the Lenox and Astor Library legacies becomes apparent

It may be argued that it is socially undesirable to discourage large bequests by suggesting the possible setting aside of the testator's wishes. But, on the other hand, the undoubted popularity of inheritance taxation suggests the time when the community will take the industrial opportunity so much into its own hands that it will become substantially independent of such bequests. Thus already the West is assuming the responsibility of education, so largely still in the East dependent upon the wishes of the dead. And in Europe the practical confiscation of church property in France has been recognized as on the whole socially justifiable. The very existence of property values depends upon social organization, and expediency has been the organizing motive in protecting non-revenue producing educational and cultural institutions. To extend or withhold this protection can then only rest finally upon the same social expediency.

Again this fundamental principle has been most luminously set forth by the action of the English Parliament in the matter of the "Wee Frees" of Scotland, in which case a Parliamentary commission deprived a small church body of large property, assigned to it by the highest legal authority of the land, on the general ground of social equity. For the point most worthy here of attention is that there was no attempt made to officially set aside the law, but only the outcome of the law.

All right of taxation is a constant assertion of over-lordship. When the Commons of England secured for itself the right of determining taxation, the communal over-lordship passed in reality from the King and Lords to its keeping. And the veto bill now before Parliament is the logical outcome of the Budget. Hence also taxation involves the power to destroy, and this power can only be controlled by ethical considerations.

Ecclesiastical establishments everywhere are being now subjected to close and sometimes hostile criticism. Should at any time the community become convinced that any institution, whether educational or ecclesiastical, has ceased to be communally useful, the weapon for its destruction is ready at hand. Exemption from taxation has fostered them, taxation can as readily destroy them. Nor can any serious defense of such endowed establishments be made, other than a clear and convincing demonstration of the social unwisdom of such destruction, and that unwisdom can only be established by proving the social service of the institution.

Hence the frank recognition of the real character of all endowments should open our eyes to the moral obligation resting upon all endowment institutions to "earn their bread and butter," by actually serving their generation in the full consciousness that they are actually supported, not by the past, but by the present. Cultured arrogance has in the institutional past regarded endowments as in some sense private property held independently of the communal will and even well-being. No such attitude can be long tolerated.

Moreover, a still wider basis than that of class possession is bound to influence men's thought. Churches and educational institutions, rightly or wrongly, are coming under the suspicion that they are the expression of a purely class spirit. The men whom Dwight L. Moody knew as the "tin-pail brigade" feel constantly more than ever estranged from the average prosperous church or college, and as soon as they recognize the

inner meaning of all endowments, this support will prejudice rather than attract them; for they will feel that the whole community is taxed to maintain a class point of view. Nor will it be a sufficient defense to plead that poor men's sons can go to such a college or poor men be welcome to the church.

The only way then is for endowed institutions to try, at least, to be widely catholic in their service of the whole community, and to realize that the support comes from the living hands of present workers, who by their maintenance of the present system consent to taxation without representation, but that an intelligent community will not long permit any obviously useless institution to exact year by year a toll, no matter what legal tradition may have to be set aside in order to stop such an injustice.

NEW YORK CITY.

The Dismissal of Professor Banks

BY JAMES W. GARNER, Ph.D.

[We are especially glad to print this letter to THE INDEPENDENT from the Professor of Political Science of the University of Illinois. The author is not only one of the most distinguished economists of America, but he is as loyal a Southerner as Professor Banks, whose recent dismissal from the University of Florida is a disgrace to the university and the State.—EDITOR.]

AS a Southerner, born and reared in the lower South, I want to endorse unqualifiedly the spirit of your recent editorial on the suppression of free speech in connection with the enforced resignation of Dr. E. M. Banks from the University of Florida. That a university professor with the high character and accomplishments of Dr. Banks should, in this enlightened age and country, be compelled by the pressure of local public opinion to resign his chair on account of his views on secession and State sovereignty seems almost incredible. What a miserable spectacle the case presents! What must be the judgment of the outside world concerning a condition of civilization in which such narrowness and intolerance exist? It is difficult to believe that any considerable proportion of the intelligent and fair-minded people of Florida really approve of such a wrong.

The man who claims the credit for driving Professor Banks from the university is the same person who recently, as a member of the Florida Legislature, threatened impeachment proceedings against Governor Gilchrist for recommending that Lincoln's birthday be made a holiday in the State, and thus compelled him to withdraw the recommendation. He belongs to the class of small politicians with which parts of the South are still unhappily afflicted, whose chief stock in trade is their ability to exploit the negro question and the issue of white supremacy, which, as everybody but themselves knows, is no longer a real issue. Happily with each passing year the number of Southern politicians who live on dead issues and whose methods consist in appealing to the passions and prejudices of the past is growing smaller and the time is not distant when they will be without followers.

The people of Florida will no doubt be able to find men for their university professorships who believe or who profess to believe in the sovereignty of the States and who will be ready as occasion requires to defend the constitutional and moral right of secession, but it will be a sad day for the State when the announcement goes forth that no others will be tolerated. Dr. Banks is right and THE INDEPENDENT is right in saying that the South is becoming more tolerant of discussion, more liberal in its economic and political thinking and more national in its views of public policy, and Senator Beard and his kind can no more prevent advance along these lines than they can turn back the clock of ages or reverse the downward flow of the Mississippi. Such petty and shameful treatment as has been accorded Professor Banks will only hasten the movement.

URBANA, ILL.

Literature

Seven Peace Books

Now that at last the peace movement is entering practical politics, and Prime Ministers and Presidents vie with the peace advocates in their espousal of the cause, we may expect a continually increasing volume of literature on the subject. Tho the best thought on peace is still to be found in stray pamphlets and fugitive articles in the magazines, much material of permanent value is now getting into book form.

The most important indictment of war since de Bloch's "Future of War" and Jordan's "The Blood of the Nation" is Mr. Angell's *The Great Illusion,*[1] a reproduction and enlargement of the author's "Europe's Optical Delusion," published last year. This book has already created a sensation in Europe. Its main thesis is that "military and political power give a nation no commercial advantage; that it is an economic impossibility for one nation to seize or destroy the wealth of another or for one nation to enrich itself by subjecting another." This is so because "wealth in the economically civilized world is founded on credit and commercial contract. If these are tampered with . . . the credit-depending wealth not only vanishes, thus giving the conqueror nothing for his conquest, but in its collapse involves the conqueror; so that if conquest is not to injure the conqueror, he must scrupulously respect the enemy's property, in which case conquest becomes economically futile." If the author means by this that wars nowadays are always an economic drain on the conqueror as well as the conquered, history both ancient and modern will bear him out. If he means also that the conqueror gains no economic advantage in the sense he did when in olden times he demanded tribute from the conquered, pillaged their property and captured their wives, we shall still pick no quarrel with him. But when he urges that these economic facts "may be utilized for the solution of the armament difficulty on at present untried lines," he is led away by the lure of his theory. The one thing that nations calculate last before going into war is the cost. The fear of footing the bills plays little part in the prevention either of war or of armed peace, which is about as bad. Tho the book is the best treatise yet written on the economic aspect of war, it has been much overrated and will scarcely revolutionize international relations.

The next three volumes before us present most alluringly the general arguments for peace. All have skilfully made use of the latest available material on the subject—of which there is a surprisingly large amount—and all are to be recommended to the general reader as well as to the specialist. Mr. Lynch's volume[2] is the most readable, the most fervid and persuasive of the three. Nobody in the United States today is more indefatigable in spreading the peace gospel than Mr. Lynch, whether from the pulpit, platform or editorial desk. His book fully covers the Hague courts and conferences, arbitration and the other actions of the governments looking toward the substitution of law for war. It is especially good in its treatment of the indirect but none the less powerful world forces that are today binding the nations together and making the world a brotherhood as well as a neighborhood. "The whole trouble has been," says the author, "that we have been living under two standards of ethics—Christian for individuals, pagan for groups, communities and nations. . . . But there is no such thing as a double standard of ethics in the kingdom of God." We especially recommend this prophetic volume to Christian ministers and to students in American colleges and universities, while the peace societies should distribute it by the thousands.

General Chittenden's volume[3] is another one of the signs of the times that

[1] THE GREAT ILLUSION. *By Norman Angell.* New York: G. P. Putnam's Sons. $1.50.

[2] THE PEACE PROBLEM. *By Frederick Lynch.* With an Introduction by Andrew Carnegie New York: Fleming H. Revell Co. 75 cents.

[3] WAR OR PEACE. A PRESENT DUTY AND A FUTURE HOPE. *By Hiram M. Chittenden, Brigadier-General U. S. A. Retired.* Chicago: A. C. McClurg. $1.

militarism is losing its pristine grip on the world. Here is a graduate of West Point, a professional soldier of the highest rank, arguing for peace with the zeal of a Tolstoy and the candor of a scientist. The book is written in a forceful style and seldom have the arguments drawn from ethics, biology and economics been presented more clearly and cogently.

M. Novicow's brief volume[4] is more of a criticism of the militarists than a constructive plea for peace thru world organization. It shows, however, a thoro familiarity with the most modern phases of the question. Tho it emphasizes more than the other books under review the sociological aspects of peace, it will not prove so valuable to the general reader as the essays of Mr. Lynch or General Chittenden.

The Geneva arbitration case of 1872 between England and the United States which settled the Alabama claims is probably the most famous arbitral case in history. It is most fortunate, therefore, that Mr. Frank W. Hackett, one of the American secretaries in the case, has now published his *Reminiscences*[5] of this most memorable dispute. The volume is written in a fascinating style, just discursive enough to give charm without distracting the mind from the thread of the narrative. It completely covers the whole case and should remain hereafter the authority on the subject. The author has included much valuable material hitherto unpublished. We wish we had the space to review this volume at length. All we can say is that it will entertain the general reader and instruct the international lawyer and peace advocate.

Of the two final volumes under review, one is written by a capitalist and the other by a socialist. While it is an encouraging sign for a business man to take the time to write a book of an idealistic nature, we are compelled to say that Mr. Stillwell[6] shows no evidence of any special acquaintance with the peace movement or its literature, tho his heart is undoubtedly in the right place. We found a printed slip inserted in the fly leaf in which it is claimed that his volume is "quaint, humorous, bizarre, cutting, stinging, uplifting, noble, prophetic, grim, gentle, profound, worldly wise, deeply religious, and one of the most readable books ever published." In our opinion none of these adjectives are apt.

Mr. Kirkpatrick's volume[7] is an impassioned appeal to workingmen to quit going to war for the benefit of the capitalists. Written in sentences of one paragraph and words of one syllable, and italicized with all the screeching type of a Hearst editorial, it curses and satirizes the capitalists with a vigor and vehemence that has seldom been surpassed in all incendiary literature. Take, for example, the following appeal to workingmen. The whole book is written in the same key:

> "In going to war I must work like a horse and be as poor as a mouse, must be as humble as a toad, as meek as a sheep and obey like a dog; I must fight like a tiger, be as cruel as a shark, bear burdens like a mule and eat stale food like a half-starved wolf; for fifteen or twenty dollars a month I must turn against my own working class and thus make an ass and a cat's-paw of myself; and after the war I should be socially despised and snubbed as a sucker and a cur by the same distinguished 'leading citizens' who wheedled me to war and afterward gave me the horse-laugh; and thus I should feel like a monkey and look like a plucked goose in January."

In addition to hundreds of sentences like the above, the volume abounds with a choice lot of "photographs of hell," which the author calls descriptions of battle scenes. Despite all these picturesque luridities, the volume shows evidence of much study and research, and certainly makes interesting reading. It is a question whether any book of this kind does more good or harm. Of course, no arraignment of war can be too strong on the moral side. On the other hand, a venomous class appeal founded on a pseudo-scientific argument is scarcely the quickest way to bring about eternal peace.

---

[4] War and Its Alleged Benefits. *By J. Novicow, Vice-president of the International Institute of Sociology.* Translated by *Thomas Seltzer.* New York: Henry Holt & Co. $1.

[5] Reminiscences of the Geneva Tribunal of Arbitration. *By Frank Warren Hackett.* Boston: Houghton Mifflin Co. $2.

[6] Universal Peace: War Is Mesmerism. *By Arthur Edward Stillwell.* New York: The Bankers Publishing Co. $2.

[7] War—What For? *By George R. Kirkpatrick.* Published by the author, West Lafayette, Ohio. $1.20

The World a Spiritual System. By James H. Snowden. New York: The Macmillan Co. $1.50.

The Basal Beliefs of Christianity. By James H. Snowden. New York: The Macmillan Co. $1.50.

Amid the multitude of volumes now appearing on philosophical and religious subjects, these two stand out distinctly on account of their clear and readable style and their well-defined point of view. Both are decidedly orthodox and very much in earnest, but they are altogether free from intolerance and disputatiousness. The editor of the *Presbyterian Banner* knows how to talk in a straight line, and to make his meaning plain enough for any attentive reader. The first of these volumes has a double usefulness; it is not only an exposition of the author's own philosophy, theistic idealism, but also may serve, like Paulsen's larger work, for an introduction to the subject of metaphysics in general, because of its concise classification of the various systems. It is better for this purpose than the histories of philosophy commonly employed, for the beginner using these is apt to get entangled on the start with Thales and Heraclitus and never get free from them. The most important books for further reading are briefly and sanely characterized at the end. Dr. Snowden begins by recognizing three steps in the approach to reality —the plain man's world, the scientist's world and the metaphysician's world. The distinguishing mark of the plain man is that he lives in the phenomenal world or world of appearances. To him things are substantially what they appear to be. The scientist goes one step farther. He reduces the world of the senses to a world of matter and motion. He knows that "every breath he draws alters the level of the Atlantic, and that when he picks up the pebble he changes the position of every star in the sky." The metaphysician makes another advance, and leaves proximate causes for ultimate ones. The idealist goes farthest of all. "He breaks down the very framework of space and time in which the world is contained and withdraws it into the mind." The world is the mind of God except for the subordinate creations of His mind, the varying personalities of men and beasts. In the human soul for the first time individuality is attained. It is simple, subject to growth, law and habit, self determining, and teleological Dr. Snowden sees the proof of God in evolution, which to him is "not simply a tale of battle, but is also a love story." "The world is the phenomenon of God." God is the infinite mind outside and inside of everything. Phenomenal evil certainly exists, but fundamentally there is but little and what there is is necessary as a foundation for further good. The idealistic monism which Dr. Snowden expounds is the official philosophy of the day, the dominant creed of university metaphysicians here and abroad. He is untouched by pragmatic criticism and undisturbed by neo-realism. His *Basal Beliefs* also sticks close to the established creeds, closer perhaps than current teaching in the theological seminaries, and it shows no scars from the present fierce conflicts over the personality of Christ and the validity of His ethics.

Howard's End. By E. M. Forster. New York: G. P. Putnam's Sons. $1.50

A house is the central figure of *Howard's End*. Not a family, but the home of a race, and its singular dominance and triumph at the end are sinister peculiarities of a very original book. Two families of different temperaments, ideals and tastes are brought together at Howard's End, the old home of Mrs. Wilcox. The Wilcoxes are of the masterful sort, "practical people," they would have described themselves; "keen on all games," business being their favorite and most profitable one. They are the sort of people who naturally attach automobiles, rich food, expensive clothes; who take the goods of life, but are skeptical of its good. They are very like their diamonds, hard and cold and clear. The other family, of two sisters and a brother, are of another world. The Schlegels have opal characteristics, that shift and change with circumstance. They care for art and literature and music with a passion most perplexing to the Wilcox mind. Helen is brilliant and beautiful and neurasthenic; Tibby, the type of the Oxonian cultured away from life, or any sympathy with its coarser

aspects, and pretty nearly all its aspects are coarse to the Tibby kind of esthete and collegian. Margaret is a lovable dreamer. But she alone has any ability to connect her thinking with the Wilcox activities, which run on like machines, quite remorseless, unconscious and efficient. In their grinding they destroy a young clerk and with him Helen, whose indignant sympathy is wont to make her a little mad. Margaret strives to make her husband see his inconsistency in condemning and driving away Helen for the same offense for which she, his wife, had forgiven him. But the Wilcox world holds to the double standard of morals for men and women, with stupid insistence that it must be, for the "sake of society." The conflict between the frank materialism of business and the unbalanced idealism of modern culture results in disaster to everybody, altho the novel leaves Margaret picking up the fragments of shattered lives and patiently piecing them together, in the quiet and seclusion of Howard's End. "Only connect! That was the whole of her sermon. Only connect the prose and the passion and both will be exalted." Mr. Forster has a rare mastery of dialog, of character drawing, and of the action and reaction of character upon circumstance.

Edison: His Life and Inventions. By E. L. Dyer and T. C. Martin. New York: Harper & Brothers. $4.

To a man writing his autobiography there must come many temptations to emphasize his glorious deeds, and to relegate into obscurity the less desirable features of his life. Similar must be the predicament of the biographer of a man who is still living. The life of Thomas Alva Edison, however, seems to be an exception. If we accept the testimony of his biographers—and apparently there is no reason to the contrary—there has been nothing in his career that cannot stand the light of scrutiny. In fact, from the testimony given, we are inclined to believe him to be a model man in all respects. The portrait here given of him is that of "a plain, easy-going, placid American, . . . a good citizen, a good family man absolutely moral, temperate in all things, and of great charitableness toward all mankind." And what more can be expected? But the world is interested in him as an inventor. And an inventor he has proved himself to be from boyhood, from "his petticoat days, when he collected goose eggs and tried to hatch them out by sitting on them himself." In these two volumes is contained the life story—incomplete, of course—of Mr. Edison, whose inventions are netting the industries of the United States the gross annual income of over $1,000,000,000. Supplemented with an extensive appendix, in which cuts and illustrations of the principal inventions are given, and enlivened with autobiographical sketches, the work is intensely interesting. Its omission of workshop and laboratory expressions, and its adoption of terms common to all readers, remove it from the technical class, thus making it pleasant as well as instructive reading.

Literary Notes

....*Speculum Animæ* (Longmans) contains four short devotional addresses given by Prof. Inge in the chapel of Corpus Christi College, Cambridge, in January of this year. They are deeply theological as well as truly devotional.

....*Truths,* Talks with a Boy Concerning Himself, by E. B. Lowry, M. D. (Chicago: Forbes & Co.; 50 cents), is just what such a book ought to be, clear, frank and decent in its explanation of the main facts of sexual life, not vague and hysterical like so many books of this kind.

....Dr. J. Paterson-Smyth, who has written several popular aids to Bible study, has just published a book of addresses on *The Gospel of the Hereafter* (Revell; $1), in which he draws from the Bible, nature and literature various helpful teachings and intimations in regard to the future of the soul.

....The Executive Committee of the World's Sunday School Association has, thru its chairman, E. K. Warren, of Chicago, issued a large volume containing the reports and addresses on *World Wide Sunday School Work,* presented at the sixth convention, held in Washington last May.

....The father of the "Hicksites" has been too little known and quite generally misunderstood. To dispel the erroneous estimate either of sainthood or of malevolence, Mr. Henry W. Wilbur has written a sympathetic study of *The Life and Labors of Elias Hicks,* based largely on Hicks's own writings.

....William Winter as a travel writer commands the same delicacy and sentiment which are his as critic and poet. Next month Moffat, Yard & Co. will publish the first complete collection of his articles about Scotland, *Over the Border*. It will be uniform with the author's book on "Shakespeare's England," and "Gray Days and Gold."

....The thoughtful reader will enjoy much of the rhapsodic glorification of nature, embodied in *The Silences of the Moon* (John Lane; $1.50), three essays by Henry Law Webb. As a religion his nature-worship is rather indefinite and lacking in vitality, but as a source of rapturous joy in the world's realities it is to be highly commended.

....The America Press will shortly publish the third volume of *Pioneer Priests of North America*, by the Rev. T. J. Campbell, S. J., Editor-in-Chief of *America*. The first two volumes of this valuable historical contribution are stirring accounts of the careers of a group of heroes and martyrs, whose life work it was well worth while to rescue from obscurity.

....Two books in neat gingham dresses come to our table, *Everyday Desserts* and *Everyday Dinners*, by Olive Green, volumes IX and X, in Putnam's Homemaker Series ($1 each), containing sensible family menus and a large number of well-tested recipes, simple enough to be within the range of the ordinary household cook. They are appetizing reading.

....The merits and demerits of Universalism as compared with orthodoxy are very ably set forth in the discussions contained in a little volume entitled *The Problem of Human Destiny as Conditioned by Free Will* (The Murray Press, Boston). Dr. Abbott and Mr. Waterhouse are leaders in the attack, and Prof. Tousey sturdily defends the Universalist position.

....Prof. A. T. Robertson has written an exhaustive study of the life of John the Baptist, whom he prefers to call *John the Loyal* (Scribners; $1.25). Every reference to the subject in early Christian literature is carefully examined and made to yield something for either the background or the delineation of John's life. The book is scholarly, but the author's view of the sources makes it necessary to use his results with caution.

....From Charles Scribner's Sons, importers, we receive the *Old Curiosity Shop* in two volumes; *Great Expectations; Dombey and Son* (two volumes); *Martin Chuzzlewit* (two volumes), and *A Tale of Two Cities*. This is Chapman & Hall's pleasantly printed and comfortably paged Centenary Edition of Dickens. The illustrations are those of George Cattermole, Samuel Williams, Daniel Maclise, Marcus Stone and Phiz, and they are reproduced in line cuts which come as a pleasant relief from the sophistications of twentieth century picture making.

....A writer in the English *Book Monthly* says that Canadians are large book buyers. Reading is, in a new country of great distances, a diversion of no mean importance, and library facilities are not of the best. Dickens, this article continues, remains the favorite author of the Canadian people. The circulating libraries state that English authors are favored by Canadians; booksellers, on the other hand, report that American fiction sells better than British, and ascribe this fact to the more interesting exterior of novels published in the States.

....Robert Schauffler is the Boswell of Gustav Frenssen, whose *Klaus Hinrich Bass* has recently been published in English translation by the Macmillans. Mr. Schauffler contributes an article to *The Bookman* in which he quotes the German's account of his method: "I work slowly, and most of the time it hurts," says Frenssen. "My natural style is short, epigrammatic and a little jerky, like the Dithmarschen themselves." In the next sentence, however, the novelist adds: "We are heavy people, my wife and I. It comes I suppose from living in a low, lonely land, where people have always been poor and anxious and suspicious and melancholy."

....The publication of plays presented on the American stage is coming to be a matter of course where the play is capable of inspiring even a minor degree of enthusiasm. So it is with Mrs. Mary Austin's *Arrow Maker*, recently presented at the New Theater and now announced for publication by Duffield. The new edition of Maeterlinck's *Blue Bird* contains the sixth act recently added to that charming play (Dodd, Mead). Granville Barker has arranged with Mitchell Kennerley for the American publication of all his work, past, present and future. The first volume will be *Three Plays*, containing "Waste," "The Marrying of Ann Leete" and "The Voysey Inheritance."

....Perhaps our novelists would do well to heed the public's growing appreciation of what one may term *warranted* romance—the romance of more or less unadulterated history. There is even a growing tendency to create a hybrid kind of literature which one may qualify as the fictional biography rather than the historical novel. In this department belongs Edna Worthley Underwood's *Book of Dear Dead Women*. One of Napoleon's loves and other near-historical ladies tell their stories most charmingly, in spite of the depressing title they labor under (Little, Brown; $1.25). From the Ave Maria Press, Notre Dame, Ind., we receive *Joseph Haydn: The Story of His*

Life, translated from the German of Franz von Seeburg by the Rev. J. M. Toohey ($1.25)—another example of the bastard genre of romanticized biography.

....The prominence given to mental healing in recent years and the attempts that have been made to understand its laws and define its applications have paved the way for a cordial reception to such a book as that of President George B. Cutten on *Three Thousand Years of Mental Healing* (Scribners; $1.50). While Mr. Cutten has not consulted original sources or sought to write an exhaustive work, he has, however, brought together and put into a very readable form a large amount of instructive material on healers and their history, charms, amulets, and relics, mesmerism, faith cure, and all forms of mental therapeutics from the early days of Babylon to the recent excitement over the Emmanuel movement.

....From now on one may expect to hear much more frequent discussion of that threadbare question, Do you prefer Dickens or Thackeray? This topic of conversation and newspaper writing is guaranteed good for the years 1911 and 1912—the centenary years of the gentlemen named. The novelist William de Morgan owes allegiance to the former. "My earliest literary recollection is the alphabet," he writes in the London *Daily Mail*, "my next, I should say, Charles Dickens." The acquaintanceship with his writings began when de Morgan was seven; at eleven he was "saturated" with Boz, and the sixty years which have elapsed since then have resulted, perhaps, in super-saturation. "If I were dying," continues Mr. de Morgan, who makes an appeal for the purchase of "Dickens stamps,"

"and were suddenly told that an unsuspected posthumous work of Charles Dickens had come to light, I firmly believe that I should wish to go on dying long enough to read it."

....A correspondent of the New York *Evening Post* writes from Dublin that George Moore has written two-thirds of a novel to be entitled "Ave, Salve, Vale." This will not only be a ripe work, but will be absolutely unique in conception, the enthusiastic correspondent informs us.

"Mr. Moore has not only taken every character in his book direct from life, but has affixed in each case the name of the original. The scene is laid in the Ireland of the present, and the personages are all well known in the domain of letters and art and public life. William Butler Yeats, the premier Irish poet—whom, by the way, it is authoritatively stated, Mr. Moore has used once before as Ulich Deane in 'Evelyn Innes,' John M. Synge, Lady Gregory, George Russell ('A. E.'), Sir Horace Plunket, Dr. Patrick Joyce, Dr. Sigerson, Padraic Colum, Sir Hugh Grant, and half a score of other leading personages in Irish contemporary life, will figure in a lively manner—indeed, to the very life—in Mr. Moore's pages."

Mr. Moore is one of the Irishmen who knows his London better than Dublin; and so he is able to write of finding the Nationalist writers grouped round Mr. Yeats "individually and collectively . . . vital, interesting. picturesque."

"Yeats, of course, I had known for some years, and his compeer, George Russell, but the other new bards chiefly by name. The innate sincerity of the movement—for it is definitely such—the enthusiasm, in itself amounting to genius, of its principal exponents intimated a new mine of material, and I have worked to develop it."

Pebbles

GRIGGS (protesting)—You don't mean to claim that your memory is absolutely perfect?

Briggs—Well, I can honestly say that at the present moment I cannot remember anything that I have ever forgotten.—*Boston Transcript.*

HUMOROUS BURGLAR (on his way out, to little Binks as he enters a room in the basement of his house)—'Ullo, old sport! You comin' fer me?

Little Binks (less heroic than when he started)—Oh—er—no—I beg your pardon. My mistake. I thought you were in the attic. —*Sketch.*

TOM—My pa is very religious. He always bows his head and says something before meals.

Dick—Mine always says something when he sits down to eat, but he don't bow his head

Tom—What does he say?

Dick—Go easy on the butter, kids, it's forty cents a pound.

A NEW YORK musical critic says that when some one congratulated David Belasco upon the honor done him by Puccini, in choosing for his new opera the libretto of his "Girl of the Golden West," the theater manager said:

"To be Puccini's librettist is, of course, an honor, but it isn't a supreme honor. It reminds me of a story about Arditi. Arditi was once invited to lecture on Shakespeare.

"'Shakespeare?' he said, with a puzzled frown. 'Shakespeare? Who's he?'

"'Don't you remember, maestro?' said a disciple. 'Don't you remember "Amleto" and "Romeo e Giulietta" and "Otello"?'

"Oh, yes—of course,' said the conductor. 'Shakespeare, the librettist!'"

THE BUDDING BOOMS.

Make room! Make room!
For the Presidential boom!
They come in proper season as the flow'rets
sweetly bloom;
Some so shy and some so flaunting,
Some so delicately haunting
That they linger thru the gloom
Like the ghost of a perfume.
Some are sad and some are sunny;
Some are grave and some are funny;
Some are modest, drooping low
'Neath belated drifts of snow;
But the shapes that they assume
Mostly meet a common doom,
Desiccated and ill fated,
Laid upon ambition's tomb;
And what greets you thru the gloom
Is the ghost of a perfume.

—*Washington Star.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Cathedral of St. John the Divine

LAST week was consecrated in this city the completed portion of the Cathedral of St. John the Divine, for the Episcopal Church and the people generally. A cathedral is the church of an entire diocese, as each local congregation has its special church edifice. As the smaller edifice fits the limited wants of a local church, so the cathedral must be larger and more elaborate as the diocese is larger. Or one may say that the local church edifice matches the priest or rector, and so the cathedral befits the bishop. As the title of bishop is more honorific than that of rector or priest, so the cathedral is the more magnificent glorification of the ordinary house of worship.

New York City already has one cathedral, that of St. Patrick. That was built by Catholics for Catholic services; this is built by Episcopalians for Episcopal services. St. Patrick's Cathedral serves many more people, and was built by a multitude of gifts of the many; the Cathedral of St. John the Divine, altho it will provide for fewer adherents, yet represents more wealth and will be the most costly and impressive religious building in the country. Already the portion built has cost, for land and erection, three and a half million dollars, and the building when finished will cost ten million more. The portion consecrated last week consists of two chapels and the choir, about one-fifth of the whole. Of its magnificence we can speak with enthusiasm. In size it is surpassed by but three others in the world, and in the hight of its steeple by but one or two. Its position is commanding; it will seem to dominate the city.

But the great question is, What will be its use? Will it dominate the city religiously? What does it express, religious enthusiasm and faith, or the vainglory of pride and the rivalry of sectarian ambition and wealth? This is the serious question which gives pause to those whose large contributions have built it, and to those who will worship there or go there to admire the architectural prodigy.

For the old question of Judas Iscariot always arises, which flippantly wants to know why large money was not better spent for more immediate needs. Yet it is always proper to consider the wisdom of any proposed expenditure, and very precious ointment is not wasted, nor is the costliest cathedral a loss if it utters nothing more than the overflowing love of the givers. We do not know, we cannot tell, how much the cathedral will add to the religious fervor or power of those who worship or who visit there. Not far off St. Michael's Church is doing already a noble work for a large number of people, both rich and poor. Will the cathedral serve them better, give them more inspiration, than does St. Michael's? We do not know. But the very existence of so large and splendid a structure will be a constant urgency to make it useful. It will require a great staff of clergy and singers and other assistants, nurses and other helpers for the poor, and servants for its care. The twelve chapels will provide services in as many languages for those who live near enough to attend and do not prefer to go to the churches of the neighborhood. It will suggest and create service as well as do service; and this service will be of the highest kind, both humanitarian and more purely religious. Its presence will be an incitement and requirement to find service in

behalf of its religious community and for the people at large such as may not be done by the several local churches; for a cathedral must do something to justify itself.

And we do not despise, as we cannot forget, the subsidiary advantage of a great cathedral, that for which grandeur and magnificence are required. We are not wholly spiritual beings. The time has not yet arrived, Quakerism to the contrary notwithstanding, when those who worship the Father shall worship him simply in spirit and in truth. The Israelites of old wanted a splendid temple and a splendid display of ritual. They did not think it proper that God should dwell in a tabernacle while King Solomon had a palace of cedar. We are all still barbarians, or at least nine-tenths of us. Our scholars deck themselves in gorgeous colors for their academic functions, not so much because they love their satin and velvet and their solemn processions, as that they may impress the multitude; and religious functions often, like the gorgeous East, shower on their celebrants barbaric pearl and gold. When we are in Europe we visit the old cathedrals more for admiration than for worship; and doubtless this cathedral will attract more sightseers than worshipers. Some who come to see will stay to pray; and those who merely admire its architecture and painted glass will remember that it was built for the service of God, and some touch of heavenly things will graze their minds. Even to those of least spiritual insight it will feed their civic pride; and those who prefer to worship elsewhere will take a pride in it as a chief ornament to the city; while to the members of the Protestant Episcopal Church it will express what they hold should be and is, the fitting supremacy of their ecclesiastical order and succession and forms of worship. The Episcopal Church has the noble ambition to supply the norm and flux for all our ecclesiastical divisions, supplying roominess for various types of faith and worship within the Christian fold; and its generous and wealthy adherents, with some help from those of other denominations, have begun to build this cathedral not with the idea that it will be for them alone, but that those of other communions, visitors from other cities and countries, may find there a place where in unity they may worship God.

Yet the question of Judas recurs, Will it pay? It is for Bishop Greer, his canons and their successors, to show us and our children whether it shall be a rich fountain of religious faith and social service, or a boast and a show. They have undertaken a great work in marble; they have a great spiritual task to achieve, following the fractional consecration.

Reciprocity with Canada

THE passage of the Canadian Reciprocity bill in the House was, of course, a foregone conclusion. By a vote of nearly three to one the bill has been sent to the Senate. Its fate there cannot now be foreseen. Republican insurgents still insist upon amendments, altho they must know that the adoption of them would probably cause rejection of the agreement or, at least, warrant a demand by other countries for similar concessions. The so-called Farmers' Free List bill, prepared by the Democrats and now pending in the House, appears to have been suggested by the complaints of these insurgents and their farmer constituents. But they do not like it. They see that it makes the following products free of duty:

> Beef, veal, mutton, lamb, pork, bacon, hams, lard, sausages, wheat flour, rye flour, buckwheat flour, corn meal, oatmeal, bran, rolled oats, and all prepared cereal foods.

Their attitude is like that of certain Republican insurgents in the House, who complained last week that such additions to the free list would subject our farmers to the competition of farmers in Argentina and other foreign countries and largely reduce the prices of farm products here. A country that exports a great surplus of such products every year (for example, wheat flour, $47,000,000; lard, $43,000,000; bacon, $18,000,000) should not fear such competition. But certain prominent Democratic newspapers are publishing statements, which appear to have been prepared by the Democratic leaders in the House, asserting that the enactment of this Free List bill would reduce the prices of the products named by the amounts of the duties

removed. In these statements the annual saving, to consumers, on fresh and preserved meats, is estimated at $133,493,752, and it is said that "at the present price of flour there should be a cut of $1.17 a barrel."

The process by which these figures and others in the statements are obtained is a very simple one: from the value of the entire quantity of a product consumed in the United States is deducted a percentage equal to the tariff duty to be removed. All this is absurd, of course, for in most cases the removal of the duty would not affect the price or cause importation of competing products. But if prominent legislators at Washington believe and say that the prices of meats, grain, flour, etc., in the home market would be reduced by the amounts of the removed duties, they must not be surprised if many farmers accept their estimates and ask their representatives in Congress to oppose the bill.

The reciprocity agreement should be approved in the Senate without amendment. Other bills affecting the tariff should stand by themselves.

The Armistice in Mexico

THE agreement for an armistice in Mexico, in order that there may be negotiations for peace, was reached unexpectedly and at a time when the danger of complications between the United States and the Diaz Government was imminent. An attack upon Juarez by the main insurgent army was at hand. There was reason to fear that this attack would cause such complaints and protests as were sent to Washington from Douglas. The situation was critical also in the more populous part of Mexico. There had been alarming revolts within 150 miles of the Mexican capital. Apparently, the sudden change of Madero's attitude was due to the arguments of his father and his uncle, as well as to the earnest warnings of Dr. Gomez, his agent in Washington, who may have been convinced that Congress would not overlook the killing of any more American citizens on their own soil by stray bullets from the rifles of either Federals or revolutionists. We suspect, also, that Madero's father and uncle disclosed to him some offers or conciliatory propositions from the Diaz Government which have been withheld from the public.

There is now an opportunity to end the fighting. It is clear that Diaz and those who stand with him are ready to grant many of the reforms which the revolutionist leader has demanded. Madero says he is willing to make concessions. Evidently he will not insist upon his entire program, and we are inclined to think that Mexico is not ripe for all of it. He has already given up his demand for the immediate resignation of Diaz. It may be that the old President will consent to retire within a few months, and that his retirement at the present time would be disastrous. If Madero is really willing to be satisfied with what will be offered, he will then have accomplished much for the improvement of the condition of the Mexican people. He should be guided by the advice of Gomez, who has done well.

President Taft deserves hearty praise for his course. It has been fortunate for both countries that the occupant of the White House is a patient and just man, having a sense of humor and well endowed with common sense. The affair at Douglas presented some difficulties. He disposed of them clearly in his admirable reply to Governor Sloan. That reply must have convinced the most suspicious critic abroad or at home that our Government was not seeking a pretext for intervention and conquest. The ill-advised response of the Diaz Government to his demand that the shooting of Americans on American soil be prevented might have led an impulsive and irritable President to some act of folly. But this tolerant and good-natured man declined to be moved by it to anger or resentment. And now a considerable part of that response has voluntarily been withdrawn. The President's wise course has exerted a restraining influence upon Congress, in which, if the resolution and speech of Senator Stone be excepted, there had been no exhibition of jingoism.

We hope to hear before the expiration of the term of the armistice that the Maderist leaders and the agents of Diaz have agreed upon a program of needed

and practical reforms, and that provision has been made for representation of the insurgents in the Government.

With the Mind's Eye

SCIENCE is a constant struggle to make verification catch up with speculation. With the eye of the mind man can see farther than with the telescope and finer than with the microscope, so the senses usually come lumbering on years behind the imagination. Leverrier discovered Neptune by his mathematical calculations before it was seen with the telescope, and in our day an equally striking confirmation of the prescience of science is to be found in the demonstration of the actual existence and behavior of molecules, of the atoms which compose the molecules, and of the electrons or ions which compose the atom; all of these being hypothetical bodies so small that there was no hope of ever being able to see them or to handle them singly. In fact, the scientist did not care much whether they really existed or not so long as he could use them. He invented these concepts because he needed them in his business and when they did not suit him he fixed them over till they did.

The molecule, for example, was invented, conceived, surmised or discovered, however you please to put it, because it brought into one simple formula all the laws of gases. If we imagine a gas to be composed of extremely minute invisible particles far apart and moving in all directions with great rapidity, hitting against each other and against the walls of the containing vessel, then we have a complete explanation of the behavior of the gas, why and how much it expands with heat and diminishes by pressure. This kinetic or motion theory of gases has done good service for a hundred years, so few scientists were inclined to question it, and those who did could not suggest anything better. Still, it has always seemed to the unscientific mind rather incredible that a gas, like still air, for instance, should be made up of such lively particles, bounding back from their collisions without loss of motion. As late as last year a book was published in this country and attained an undeserved popularity, "The New Word," in which the author, Allen Upward, made all manner of fun of the kinetic theory, not knowing how soon the motion of the molecules would be visibly demonstrated.

Such visible demonstration is announced this week from the physical laboratory of the University of Chicago, where Prof. Robert A. Millikan has been for the past year experimenting with a new method of altogether unprecedented delicacy of perception. The apparatus is exceedingly simple in principle and easily understood, yet it opens fields of research hitherto regarded as unattainable. Professor Millikan uses a minute drop of oil blown from an atomizer and suspended between two brass plates about half an inch apart. The space between enclosed in glass is illuminated by a beam from an arc light so that as seen from the side the drop looks like a bright star on a black background and can be watched and measured by a cathetometer telescope. The drop is so small that it sinks slowly thru the air, and before it drops out of sight it can be pulled up again by giving the plate above a charge of electricity opposite to that borne by the drop. By switching on and off the electrical charge of the plates the little sphere of oil can be kept suspended between them indefinitely, like Mohammed's coffin between heaven and earth.

Now when the enclosed space between the plates is filled with perfectly still air under ordinary atmospheric pressure the drop remains quiet, slowly rising or falling as the case may be. But when the air is exhausted almost to a vacuum then it begins to dance violently as tho it were being knocked about, first on one side and then on the other. So in truth it is, for it is being bombarded by the flying molecules of the rarefied gas, whose motion is now for the first time made visible. The fewer the molecules of air the more violent the jerks of the drop which, as we can readily see, is due to the fact that when it was in air of normal pressure it was constantly being hit on all sides at once, but when the number of molecules in the air is reduced it is not hit so often and so is driven back and forth. When a push ball on the

college campus is in the midst of a mass of struggling freshmen and sophomores it cannot move, but if it gets out where the crowd is thinner it is knocked about.

But more wonderful things than this has come out of Millikan's oil drop. It has demonstrated not only the molecular theory of gases but also the atomic theory of electricity. Professor Millikan and his collaborator, Mr. Fletcher, have been able to keep a drop suspended in air for five hours at a stretch, observing and recording its rise and fall under the influence of gravity and the varying electrical changes of the brass plates above and below. Now as they watched they noticed that the drop would suddenly begin to move much more rapidly or slowly. It might, for example, be a negatively charged drop rising upward to the positive plate at a given rate, then it would change its pace and move twice as fast. This is because it had picked up from the air an extra charge of negative electricity. Then a few minutes later it might change back to its old rate on account of taking on a positive charge. These free electrical charges, or ions as they are called, are present in very small numbers in ordinary air, but by bringing a sealed tube containing a bit of radium near the apparatus they can be increased as much as desired; that is, the radiation from the radium breaks up the neutral molecules in the air into positive and negative ions. Sometimes both these ions, released from a neutral molecule, could be caught on two of the floating oil drops. By drawing a drop up to one plate or the other and increasing the ionization of the air, the drop could be fed on ions of either kind, one at a time or more rapidly, as desired. But the important point here is that the electrical charges were always exact simple multiples of one definite elementary charge. The investigators have seen the drops acquire new charges of electricity in several thousand cases, and in no instance has it been a fractional charge or a gradual accretion. The initial electrical charge of the drops experimented with, due to the friction of the atomizer, has varied from one to 150, but in every case this initial charge was found to be an exact multiple of the smallest charge caught from the air. In chemistry the existence of the atom was proved by the fact that in all compounds the proportion of each element present is found to be a simple and exact multiple of the combining weight of the element, and now we have the same proof of the existence of the electrical atom or ion. It has long been known that electricity was to be found only on the surface of a charged body, and now it appears that the electricity does not form a continuous coating over the surface, but has a granular structure. The charged oil drop is simply peppered with a definite number of specks of electricity, positive, negative or both.

The many other applications of this method, already made or prospective, we cannot here consider, but from what we have suggested its importance will be apparent to all. It is as if sociologists, hitherto confined to the study of statistics covering the whole population of the globe, had suddenly become endowed for the first time with the power of perceiving the individual. The work of many investigators in recent years have proved that the study of the ultimate units of physics and chemistry as individuals is not so impossible as used to be supposed. Crooks with his spinthariscope showed that the bombardment of the particles shot out by radium could be seen as distinct flashes of light, and Rutherford has been able to isolate and catch single ions, tho they are only a thousandth part of the atom of hydrogen.

The Ryerson Laboratory of the University of Chicago has been chiefly known to the world on account of the investigations of Professor Michelson on light, for which he received the Nobel Prize, but these new discoveries seem worthy to rank with his. Professor Millikan is a younger man than Professor Michelson. He was born in Morrison, Ill., in 1868, and graduated at Oberlin in 1891. After teaching there for two years he went to Columbia, where he received his doctor's degree and later studied at Berlin and Göttingen. On his return in 1896 he entered the faculty of the University of Chicago as assistant in physics, where

he has been indefatigable in his study of the problems of light and electricity and has also found time to write seven text books on physics.

Archbishop Farley's Refusal

It is a very curious correspondence that has passed between Comptroller Prendergast, of this city, and Archbishop Farley. The Comptroller, who has charge of all accounts for the city, wrote to the Director of the Mission of the Immaculate Virgin, Father Fitzpatrick, saying that it was impossible to audit the accounts of the Mission without auditing also the accounts of St. Joseph's Union, which is an auxiliary of the Mission, and gives name to its St. Joseph's Home for Boys and the St. Joseph's Trade School. The Comptroller said that as the profits of the *Homeless Child,* the journal printed by the boys of the Trade School for circulation among contributors, were part of the income of the Mission, the accounts should be audited. The conditions of receiving support from the city require the full privilege of audit by the city. The Archbishop, by his legal counsel, absolutely refuses to allow the Comptroller to have access to the accounts of St. Joseph's Union, says it receives no public moneys, and should not be subject to examination, and that the *Homeless Child* is sent free to those who contribute to the institution. The Archbishop adds that the city has the right only to inquire whether the amount it appropriates has been properly expended; and that if the city insists on auditing the resources which the institution receives from donors and other sources, and making such inquiry into its private affairs, then he must ask the city to withdraw the children committed to this and other institutions.

This is a startling proposal, hardly more than a bluff. While the Archbishop's reply declares that the amount received from the city does not cover half the cost of support, counting in interest on cost of buildings and unpaid services of priests and sisters employed, it has been often asserted that the payment by the city is more than adequate. There are now over 1,200 children committed to the Immaculate Virgin Mission, who are paid for at the rate of $2.25 a week. These homeless children are now under Catholic instruction; and a multitude of others the Archbishop threatens to give back for such other provision as the city may make, if the audit of the sources of income is insisted on. We can see no reason for this. On the other hand it would seem a very proper thing to require. It is conceivable that by gifts thru St. Joseph's Union and from other sources, made for the support of these homeless children, enough might be secured to support the Mission, and that the additional $150,000 a year from the city might be diverted for other purposes. That is conceivable if improbable, and it is necessary that the Comptroller be watchful against unexpected dangers, and this is of advantage to the institution as well. We may add that the St. Joseph's Union, which is established to help the Mission, receives a subscription from its members of not less than 25 cents, and they receive the *Homeless Child,* and in further support it has been in the habit of supplying contributors with St. Joseph's Cord which, when worn about the waist, is of benefit for the preservation or recovery of chastity, and for assistance in the hour of death. Many miracles have been received by it, and many indulgences are annexed. The St. Joseph's Union also has control of St. Benedict's medal, which is efficacious against sorcery and other diabolical works, repels temptations against holy purity, preserves against poison, plague, lightning, storms at sea, and has often been found, so its wearers are assured, a remedy in falling sickness, hemorrhages, pleurisy and other diseases, and frees cattle from plague or epidemic. For the latter purpose it should be dipped in the drink of animals. The unbelievers will call this fetishism, but we are also at liberty to call it an elder variety of Christian Science. Thru St. Joseph's Union, its little quarterly paper, its cord, and its medal, the Immaculate Virgin Mission receives a considerable income in addition to what is given it by the city, and we cannot understand why the Archbishop should object to the auditing of these sources of income.

Educational Freedom

THE case of Prof. E. M. Banks, of the University of Florida, forced to resign from the faculty because of an article of his printed in THE INDEPENDENT, is attracting great attention in educational circles, and we publish in this issue an article on the subject by Professor Garner, of the University of Illinois, and we have other letters on the subject from instructors in Southern institutions. It was because of this article and on account of a book on American history used in his classes that the opposition to him was made. We should have objected to the book because of its see-sawing character, balancing criticism of slavery with apology, trying to please both sides in the Civil War, and so get Southern patronage. But Professor Banks's enemies wanted only one side told, and so he had to go. He had too much courage for his locality. But conditions are improving, and the men who live on past issues are rapidly serving their country by passing away from it. A similar case lately came up in Roanoke College, Virginia. There the professor of history used this same book and one of the trustees, a judge of dignity, discovered in it something he did not like and demanded in the papers and in the board that the professor be removed; but his fellow trustees refused, and the professor remains while the judge resigned, as in Thomas Hood's old rhyme:

"The man recovered from the bite;
The dog it was that died."

We trust there will not be a worse case of interference with educational liberty in Rhode Island. The report given to the press is, that its Agricultural College at South Kingstown needs badly a science hall; but the town went Democratic at the last election, and some of the professors were active on that side. Accordingly, so the report goes, the Republican leaders will punish the college by refusing to take up the bill appropriating $75,000 for this purpose. The attempt to take the bill out of the hands of the House Committee on Public Institutions failed by a vote of 54 to 35. Rhode Island is not a poor State; it can afford the appropriation. Refusal on the ground given is simply contemptible and will react on those who would thus punish the free expression of political opinion.

And this brings up another view of the eternal conflict. In the Civil War the conflict was entered upon for the purpose of maintaining privilege, the privilege of holding slaves. Now the conflict is over the privilege of industrial wealth. That is the trouble in Rhode Island. That was the trouble when Professor Ross was removed from the Leland Stanford University eleven years ago. Then the teachers of economics the country over entered their protest, and it may be that the time has come now when such united action may again be taken.

The Play as Literature

IT used to be said, truthfully enough, that one reason why the American theater was a hopeless proposition, from every standpoint except the commercial, was that we failed to regard the drama as a literary form. And surely to despise an institution is an infallible means of ensuring its deserving scorn. The French, we have been often informed, read plays as well as go to see them acted; every Parisian theatergoer is himself a dramatic critic. The excellence of the French theater follows. Therefore, that we are changing all this, so far as the reading of plays goes, is a hopeful sign. The works of Maeterlinck, Edmond Rostand, and others, appear in lists of the most popular non-fiction (why "non-fiction," we wonder?) circulated by our public libraries.

American playwrights also succeed, nowadays, in publishing their plays in book form. Cases in point are recent volumes bearing the names of Josephine Preston Peabody (Mrs. Marks), Edward Sheldon, Percy MacKaye and John Corbin. Translators bring Andreyev's shivers and Wedekind's indecencies into our ken, and find publishers! Publishers import from England the shapeless yet ever earnest productions of John Galsworthy and the "conversations" of Mr. Shaw. From Ireland they have brought us Yeats's dramas of the Celtic twilight, and are bringing John Synge's fiery plays of a more actual Ireland, yet a not less poetic.

Some one must be reading drama as

well as seeing it—or yearning to see. And the change in our public's attitude is not to be attributed solely to the ladies and their literary societies. In part we can thank the university extension lecturers, and their kind: the successors of the lyceum lecturers of an elder day. That this last influence is by no means negligible is suggested by an article recently published in the Chicago *Record-Herald,* signed by that journal's dramatic critic, who pays a generous tribute to William Norman Guthrie and to Prof. G. P. Baker as the leaders in this work of the popularization of the play as literature. "They deal in a vital way with plays of which the purpose is to deal with the life of today," he writes. That a Chicago newspaper man should speak appreciatively of academic persons who profess to expound the subjects of his daily columns, is already something. It marks a growth in tolerance, at least. And we welcome all these signs of a new era. The stage of today has no brand-new masterpieces to offer, but the mills of the gods grind slowly. Give them time—continue to read their plays when they are worth reading as well as to see them when they are worth seeing—and the stage in America will, unless we are mistaken, gradually gain in intelligence and artistry as it has already gained in respectability.

Harmon and Wilson

With a fair chance of electing their next President, the Ohio Democrats are none too early in trying to get Governor Harmon's claims before the public. It is pretty evident to them that the tide is moving toward New Jersey. The likelihood of the renomination of Taft by the Republicans is unfavorable to Harmon, as George Harvey has explained. As it looks now the Democrats will want to nominate not a conservative, but a man supposed to be markedly progressive, if not a radical, and that means Speaker Champ Clark or Governor Woodrow Wilson, one a Southerner and the other of Southern birth. It is the fear of these men as candidates which actuates the present supporters of Governor Harmon. In the New Jersey Legislature just adjourned, Governor Wilson has achieved extraordinary success, even greater than that of Justice Hughes when Governor of New York, and by the same means of frank appeal to the people. Among his victories, and against the will of the bosses of both parties, may be mentioned the passage of the Primary and Election bill, the Corrupt Practices act, the Public Utilities act, the Commission Government bill, the bill for indeterminate sentences, and an act regulating cold storage. Seldom if ever in the history of a State have so many and important pieces of legislation been achieved; and all this success will tell strongly for Governor Wilson when the Democrats come to nominate a President.

The Coronation

The London *Times* describes the coming Coronation at Westminster. The order of the ceremonial is divided into the following twenty subheads:

"I. The Preparation. II. The Entrance into the Church. III. The Recognition. IV. The Litany. V. The Beginning of the Communion Service. VI. The Sermon. VII. The Oath. VIII. The Anointing. IX. The Presenting of the Spurs and Sword and the Girding and Oblation of the Said Sword. X. The Investing with the Armill and Royal Robe, and the Delivery of the Orb. XI. The Investiture per Annulum et Baculum. XII. The Putting on of the Crown. XIII. The Presenting of the Holy Bible. XIV. The Benediction. XV. The Inthronization. XVI. The Homage. XVII. The Queen's Coronation. XVIII. The Communion. XIX. Singing Te Deum Laudamus. XX. The Recessional."

The explication of these twenty heads takes one great page of the London *Times* and the commentary two pages more. We give only the first paragraph of the explication under I. "The Preparation":

"In the morning upon the day of the Coronation early, care is to be taken that the Ampulla is to be filled with Oil, and, together with the Spoon, be laid ready upon the Altar in the Abbey Church."

The House of Commons has nothing to do with it all; it has taken no part in the Coronation since it removed Charles I's head from under his crown. In the Oath the King first promises briefly to rule under the laws and then much more at length to maintain "the Protestant Reformed Religion," to "preserve inviolably the settlement of the Church of Eng-

land," and, further, to "preserve the Bishops and Clergy of England, and to the Churches there committed to their charge" all their rights and privileges. The renunciation of the Papacy does not here appear. All this elaborate parade of pomp, with kneeling bishops and archbishops, princes, dukes, marquises, earls, viscounts and barons; the Lord Great Chamberlain, who kneels to touch the King's heel with the spurs; the four Knights of the Garter, who hold over him the rich Pall of Silk; the four peeresses, who hold the rich Pall of the Cloth of Gold over the Queen—all this pomp befits the memory of high majesty of the days of the divine right of kings, and equally befits the absence of the representatives of the people. It will be a noble show, a fine reversion, an atavism; and to see from a window the procession that goes to the Abbey Americans are paying from $25 to $100. They can't get in.

For Tuberculosis

Andrew Carnegie never got the pleasure out of making money that he has got out of giving it away for the benefit of the public. A man can hardly be happier than is Dr. Pearsons in giving away his millions. It is a great satisfaction to him that he has now succeeded in giving it all away wisely except what he needs for his living. Mr. Rockefeller says very little about his feelings, but there is no question that his wise benefactions are his chief pleasure. Similar are the experiences of Anna Gould and Mrs. Sage. Now, James A. Patten, of Chicago, a man of many millions gained as an operator in grain and cotton, is reported as giving $2,000,000 for the purpose of stamping out tuberculosis, the disease of which his brother died. He is quoted as saying: "A man should dispose of great wealth for the benefit of the community, social service being the one great thing in life." That is true, and if one who has given his energy to acquiring wealth finds it out not too late, his latter years will be worth living, for himself as well as for the community. But that is a lesson for other than rich men. It is the best part of religion.

A College Much Needed

The Native Affairs Commission appointed by Lord Milner eight years ago recommended that there be established in South Africa a college for training native teachers and giving higher education to native students. Now such a college is to be founded, as European sources have subscribed $112,500 and native sources $90,000. We are told that the college courses are to be framed with due regard to the difference between the average native and European student in language, "in inherited beliefs, prejudices and instincts," and in future position in life. But there is no difference between natives and Europeans in inherited beliefs, prejudices and instincts. Beliefs and prejudices are not inherited, but learned, and instincts are the same for all people. Under missionary instruction there has grown up a considerable class of fairly educated and respectable natives, and they need all the chances for education that we have already provided for our negroes, or that white people need.

Benigni Shelved

The name—Benigni—has been a harbinger of trouble to all church liberals. Turning up in Rome when Leo XIII was as yet liberal, this obscure priest started a journal, which dropped out of sight with Leo's reactionary turn. Duchesne, the famous historian and now one of the forty Immortals, published in it a characteristically Duchesnesque criticism of the gospels. Today it is simply impossible to find a copy of Benigni's first attempt at journalism. To make up, as it were, for this misstep, Benigni became an out-and-out reactionary. With the advent of Pius X and Cardinal Del Val, he became a shining light. It was Benigni here and Benigni there. Soon he started a journal, irregular in its time of appearing, chiefly the result of scissors as to matter, while a few passages in it would be an onslaught on Modernism and Modernists. At his hands French bishops visiting Rome suffered hard snubs. Thru him was all ingress to the sacred Court of Damasus at the Vatican. Now he is shelved. It was done in the peculiar way of the Curia *Promoveatur ut amoveatur.* His position as Under-

Secretary of Extraordinary Ecclesiastical Affairs, which served to give him the official status needed for a successful Curialist, is gone. Benigni is now a protonotary Apostolic. The Vatican is rid of him. Not only the Episcopate of France and Modernists everywhere, but the American bishops will send forth "Te Deums" *in gratiarum actione.* From now on the inner rumors of Benigni's life will resound louder and louder. And once more the world will learn what a despicable character is he who played such an important role in French Separation and in the wholesale condemnation of Modernism.

The prohibition law in Atlanta is not working perfectly, but so well that negroes in that city save at least $50,000 a year in fines in a single court. As a result there has been an epidemic among them for the purchase of desirable properay. In some cases whole blocks once occupied by whites changed complexion. Alarmed at this progress certain elements among the whites secured the introduction of an ordinance into the City Council which contemplated the prevention of whites and blacks living in the same block. But even before the Baltimore courts had declared the segregation law enacted there invalid, the Ordinance Committee of the City Council of Atlanta had decided to bury the segregation ordinance referred to it. We trust that this ordinance is buried as the old lady desired to bury the devil, with his face downward, so that if he ever woke up the more he scratched the deeper down he would go! To say that an American citizen cannot dwell safely under his own vine and fig tree is to repudiate the fundamental law of human rights.

It is cheering to see the report which Mr. McBee, editor of *The Churchman*, who is visiting the Near East on a sort of religious mission, brings of the admirable influence in Egypt of the mission work of the American United Presbyterians in that country, and especially in revivifying the ancient Coptic Church. Altho the United Presbyterians have but about 100,000 members they have, says Mr. McBee, done a larger work in Egypt than any other church except the Roman Catholics. Its schools teach Christians and Moderns, and its graduates are in almost every walk of life. The Copts have established a large modern school in Alexandria with 680 pupils, and of its twenty-four teachers ten are graduates of these American schools, the principal a graduate and a Protestant. The Churches of England seem to be afraid to do much lest they stir up Moslem fanaticism.

It is a really startling article, very calmly exprest, in which in our present issue Prof. Thomas C. Hall, of Union Theological Seminary, presents the thesis that all endowments for educational, ecclesiastical or charitable institutions are in fact supported by the toil of those whose labor pays the income of the endowments; and that so the public is taxed for their support; and that what the public has thus given by income and by remission of taxation it can take away properly when such an institution ceases to be socially useful. That doctrine we accept. The State has the right of eminent domain over all endowments, and can, when wise, justly destroy them by taxation. Their business is to prove by their social service the policy of giving them special favor.

This is a clerical statement which we read in *America:*

"Let us say boldly that war is not an unmixt evil. . . . Human society owes a great debt to the crusaders, and to those who fought the long battle against the Turk; and not unjustly does every nation honor its warriors."

That depends. France honors Napoleon less than it did. Honor is due to those who defend their country from invasion; and so, when Turkish invasion was driven back from the gates of Vienna, we do give honor to the arms of defense. But how about the Crusades? Was there ever a more indefensible invasion? General Sherman did not speak of war as "not an unmixt evil." He said, "War is hell!"

The persistence of religious conservatism in certain sections is remarkable. We remember that some thirty years ago a Baptist journal published in Louisville, Ky., when asked whether it would be right in a public Sunday school exercise

for a woman to repeat a verse of Scripture, replied that she could hardly be guilty of a greater sin, for she would be using the Bible to disobey the Bible, which forbids women to speak in public. Just now the same paper is shocked that some women have taken part in a Baptist Church in a meeting conducted by the Young Women's Christian Association, and it dreads the coming of a "petticoated pulpit." Let it come; indeed it is already here.

A year ago it seemed quite improbable that three-fourths of the States would ratify the amendment to the Constitution allowing the imposition of an income tax, but now it seems almost certain that it will be ratified. The New York Senate has accepted it, thus reversing a previous negative, and the Assembly will probably follow. Thirty States are already recorded in the affirmative, and only five more are required, unless Arizona and New Mexico should be admitted. It would seem that Congress ought to have the power to lay an income tax, whether it exercises it or not.

They thought it a joke when a bill was introduced into the Colorado Legislature making it a misdemeanor to buy, sell, give away or have in one's possession cigarets or cigaret papers. It was pushed by the Federated Women's Clubs, and they lobbied for it and carried it thru the lower house and it is expected to go thru the Senate. Let it be understood that women are no joke. They are in earnest, and they hate tobacco and know its use is a filthy practice, and ruins a multitude of youth. They want to protect their boys.

There are indications that as an Establishment the Anglican Church is breaking up from within, and the Free Churches of England will find helpers among the advanced churchmen to separate from the State. The chief organ of the Ritualists is *The Church Times*, and it is publishing a number of letters from correspondents complaining of the hindrances put in their way to practise rites familiar in the Roman Church. There exists among them a great desire for separation at all costs for the sake of freedom. That seems reasonable and right.

Capt. J. M. Bowyer, Superintendent of the Naval Academy, has apologized to Professor Beers, of Yale, for objecting to the presence of his daughter at a cadet ball and explained that it was due to "a misunderstanding of her status," it having been shown that she was really a sort of a "companion" and not a working girl. The more important question now arises whether Captain Bowyer will apologize for his insult to all working girls who are not daughters of the President's favorite professor.

The effort making to repeal the famous Maine law should be resisted by the combined urgency of all enemies of the saloon in the State. We are glad to learn that an appeal to the citizens of Maine to maintain the law has been signed by many leading friends of temperance in Europe and America. It is true that the law is not fully observed in some of the cities, but neither are the laws against theft and murder. Repeal would be a slump in decency and thrift.

Ex-Speaker Cannon mentions it as an objection to the reciprocity agreement with Canada that "the country, the Senate and the House had actually nothing to do with the preparation of the agreement with Canada." And why should they? It was prepared by experts on both sides who knew their business, and if left to Congress it would have been discussed forever. That is the modern way to get things done.

The Rev. S. Baring-Gould, in a paper on "Breadth," in the London *Guardian*, says:

> "The aspect in which Churchmen should regard the various phases of sectarian religion should be one of tender regard for imperfectly developed spirituality, just as in nature we look with a kindly eye upon the inferior organisms."

Indeed? Is this "breadth"?

The movement for the closing of post offices on Sunday makes good progress. The Boston Postmaster has ordered the office closed on Sunday, to the benefit of the mail employees, and with injury to nobody.

Insurance

New Head of Equitable Life

At a meeting of the directors of the Equitable Life Assurance Society in New York on April 20, 1911, William A. Day, for the last five years vice-president of the society, was elected president. The meeting of the directors was attended by thirty-one members of the board, of whom twenty-eight voted for William A. Day, the others not voting because they thought the selection of a new president should be further postponed. The proposal to fully mutualize the society was discussed and the directors put themselves on record in favor of mutualization, if it could be accomplished without protracted litigation and without impairing the surplus. The situation in regard to the mutualization is discussed elsewhere in this issue. Superintendent Hotchkiss attended the meeting and spoke strongly in favor of the mutualization.

Copyright by Underwood & Underwood

WILLIAM A. DAY,
The new president of the Equitable Life Assurance Society.

William A. Day was born on June 11, 1850, in Wilmington, Del., and received his early education at the public schools in that city. He later attended the Harvard Law School, but did not remain to receive a degree. He was appointed by President Cleveland in 1885 as an auditor in the United States Treasury. He was later a special assistant to the United States Attorney-General in cases under the Interstate Commerce and the Sherman Anti-Trust laws. From 1903 to 1905 he was Assistant Attorney-General and was in charge of the prosecution of trust cases. President Day was a friend of many years' standing of J. Sterling Morton, father of Paul Morton. About 1895 he came into close contact with Paul Morton, and they became intimate friends. In July, 1905, President Day resigned his post at Washington to become associated with the Equitable Life. His legal experience and knowledge was of great service to the society in connection with the administrative complications which followed the life insurance investigation. On May 31, 1906, he was elected vice-president of the Equitable, to fill the vacancy caused by the resignation of James H. Hyde.

In a statement issued to the agency force after his election last week President Day says:

"It shall be my aim to make the Administration more efficient and economical, in order that the full benefits of mutuality may be realized in the reduced cost of insurance. The test of chief importance that shall be applied to every proposal is, 'Is it sound and in the interest of those who insured with us and those who are provided for by our policies?' The primary object of our institution is to furnish the best insurance at the lowest cost to the end that those who have bought protection in our society shall ever find it worthy of their commendation."

The 90,000,000 people in the United States use more matches than the 900,000,000 in the rest of the more or less civilized world. Over 1,000 fires in Chicago in 1910 were due to the careless use of matches.

Mutualization Again Deferred

THAT no definite action toward the mutualization of the Equitable Life Assurance Society was taken by the directors at their meeting last week was a distinct disappointment to those who have the future of the great company and its policyholders at heart. Based upon the previous assurances of the largest proprietary interests in the stock, there existed a confident belief that a substantial start toward putting the policyholders in actual possession would be made at the first favorable opportunity; and the election of a successor to the late Paul Morton in the presidency was regarded as a fitting occasion on which to inaugurate the work.

Just why the controlling stock interest persists in its dilatory policy on this point is not clear to the man who thinks straight. The impression prevails with the consent of that interest that the society is to be transformed into a mutual corporation by retiring the $100,000 of stock which now controls its nearly half a billion assets. That being true, why are not even the initial steps taken toward that end? Why is every opportunity to make a beginning permitted to pass unimproved?

At their meeting last Thursday the directors, in a resolution adopted, state that mutualization is desirable, provided it can be accomplished without protracted litigation or substantial reduction of the free surplus, but that it has been found impracticable to carry the negotiations to a definite conclusion in view of Mr. Morgan's absence in Europe. Of course this does not give us the real reasons underlying the failure to commence the work. Mr. Morgan is not continuously absent, and when he is away from his American headquarters, his business here is not suspended until he returns. His affairs suffer no interruption.

That difficulties will be encountered thru the opposition of the minority stockholders is a safe hypothesis. But the sooner those committed to mutualization commence to grapple with the problem, the sooner will they see the successful end of this work. They are gaining nothing by this procrastination. Public opinion has already decreed that this powerful financial institution shall not permanently remain the property of a few rich men; and while this dictum may not seem to square with our political system, there is in it largely an element of primitive righteousness—a reiteration, as it were, of the doctrine that self-preservation is the first law of nature—so preponderant, in fact, as to make it irresistible. The capital stock of the Equitable will be retired. Those now in possession of it may safely philosophize with Hamlet:

"If it be now, 'tis not to come; if it be not to come, it will be now; if it be not now, yet it will come: the readiness is all."

They have it in their power to defer the event; by various methods and devices they may postpone it for years; but they cannot defeat it. That they should accept the decree tactfully and turn it to their own profit as the fruit, in part, of their own virtue, would seem to a wise and discreet man the natural thing to do.

Reference is made in the resolution adopted by the board of directors to the society's "free surplus"; that the process of mutualization must be so directed as not to work any substantial reduction in it. This allusion to the surplus recalls previous discussions indulged in respecting its ownership. There seems to be an idea that some of it may belong to the stockholders. There is no visible foundation for such a belief. The stockholders have, year by year, received the wage earned by their money under the charter. With the payment of the 7 per cent. annual dividend stipulated in the charter, the policyholders discharged all their obligations in that direction. Every dollar of surplus in the Equitable Society's treasury is the property of the policyholders.

The reforms which signalized the administration of the last five years will be perpetuated. The ground gained in this respect will be steadfastly maintained. There will be no backward steps. The society is and will be conducted in the spirit of the laws which have been placed on the statute books in the interest of justice to every holder of a policy. In a word, the Equitable shall continue to be the policyholders' company, for whom all are working.

Financial

Stocks and the Industries

OWING to the Missouri Pacific controversy and the danger of complications along the Mexican boundary, stocks became more active last week, transactions rising to 1,690,600 shares, from 578,000 the week before. The net decline for the week, in the most active securities, ranged from 2½ to 4½ points. On Tuesday, the 18th, sales were 550,000 shares, and more than 400,000 were sold on Wednesday, but afterward the market became very dull. The trouble in Missouri Pacific was due to the election of B. F. Bush to the presidency by the Gould interests and against the wishes of Kuhn, Loeb & Co., who thereupon withdrew their representatives from the board. It appears that George Gould has not retired. He was unwilling that bankers so closely identified with Union Pacific and Southern Pacific should also be the Missouri Pacific's fiscal agents. As he retains the Standard Oil support, together with that of the Deutsche Bank, and has made an alliance with Speyer & Co., prominent international bankers, the incident has ceased to have much weight in the stock market. Missouri Pacific, which rose in February, during the fight for control, to 63, fell to 45½, but rose again, so that the net loss for the week was only half a point.

The iron and steel industry has been affected by pending tariff propositions and by prevailing conservatism in general trade. Construction work on the American Steel and Wire Company's new plant in Alabama was suspended last week, and 600 workmen were discharged. Upon this plant $3,000,000 was to be expended, and it would have employed 2,500 men, but if wire, wire rods, wire staples and steel bands are to be placed on the free list (as proposed in the House bill soon to be taken up), the company prefers to wait until the effect of the legislation is shown. Representative Underwood, in whose district the plant is situated, sees 3,000 workmen discharged, instead of 600, and says the suspension of work is a blow aimed at him, as he is chairman of the tariff committee. But the company's explanation is a reasonable one. The truth is that the situation, and the uncertainty, with respect to radical changes in the tariff, is affecting many industries and general trade. Iron and steel output is declining, for lack of demand. Furnaces are going out of blast because unsold stocks are increasing. Many manufacturers feel that they must proceed with caution. Such conditions can always be observed when the removal or a large reduction of tariff duties is expected or promised. If changes are to be made, there should be no delay that can be avoided. It would be unfortunate if uncertainty should continue for a year and a half or two years.

*

....At the forty-eight postal savings banks the sum of $201,961 was on deposit at the end of March, and there were 4,307 depositors.

....An interesting history of the Bank of New York, National Banking Association, has been published. This is the oldest bank in the State of New York, having been organized in 1784 by Alexander Hamilton, and there is only one older bank in the United States. Its home has been at 48 Wall street since 1798. When it was opened for business, Mr. Hamilton's residence was at 57 Wall street. As he was a director of the bank for a time, and for years its counsel, this history contains many extracts from his letters to the bank's officers. The reader learns much also about the early directors, the business methods of New York a hundred years ago, the coins and other currency in circulation, etc. The old bank has had a fine record. At the present time Herbert L. Griggs is president and Charles Olney vice-president and cashier. The bank's total resources are $35,627,849 and its deposits $28,531,308. With a capital of $2,000,000, it has $3,638,640 of surplus and undivided profits. It was incorporated as a national bank in 1865, and in the same year it established the first safe deposit department in the city.

The Independent

VOL. LXX NEW YORK, THURSDAY, MAY 4, 1911 No. 3257

Survey of the World

The Eternal Tariff

In opening the debate on the Farmers' Free List bill, April 25, Representative Underwood, of Alabama, Democratic Chairman of the Committee on Ways and Means, committed his party to a tariff-for-revenue policy. He promised a reduction in many tariff schedules which, he asserted, were now prohibitory and therefore unproductive of revenue. He also made the first official announcement that the House would be invited to revise the tariff, schedule by schedule. His party would not, he said, impose taxes for the benefit of particular persons, localities, or industries. He said that the pending bill would reduce revenues by about eight millions, and that Canadian reciprocity would increase this reduction to twelve or thirteen millions of dollars. This loss of revenue is to be canceled by duties collected on importations of articles now shut out by unfair schedules, the new duties being "on a competitive basis, fair, not only to the American, but also to the foreign manufacturer."—— Representative Prince, a Republican member from Illinois, denounced the Canadian Reciprocity bill in a speech delivered April 28, as the most "unconscionable bargain" ever driven, and attacked the Farmers' Free List bill as the "farmers' fake bill." He charged that of the $10,000,000 revenue which he said would be cut off by its enactment, only Southern farmers would reap a considerable benefit. —— Democratic leaders looked for the passage of the Free List bill by the House of Representatives not later than Wednesday of this week.

A Padded House

The increase in the membership of the House of Representatives, provided for by a recent vote reported in last week's "Survey," becomes effective with the next Congress. The forty-two additional members will represent the following States:

Alabama, Colorado, Florida, Georgia, Idaho, Louisiana, Michigan, Minnesota, Montana, North Dakota, Ohio, Oregon, Rhode Island, South Dakota, Utah, and West Virginia (one member each); Illinois, Massachusetts, New Jersey, Texas, and Washington (two members each); California and Oklahoma (three members each); Pennsylvania (four members); New York (six members).

The increase is from 391 to 441 members. Representatives of long service and sound knowledge of legislative experience here and abroad regret the action taken by the House, which it is now the prerogative of the Senate to approve or to reject. The increase is made solely to spare any State from a reduction in its Congressional representation. Upon the basis of the present membership, 391, the loss in representation as a result of reapportionment would be divided among thirteen States, as follows:

Illinois, Indiana, Iowa, Kansas, Kentucky, Nebraska, North Carolina, Ohio, Tennessee, Virginia, and Wisconsin (one member); Missouri (two members).

Republican Factions in the Senate

The Republican party has a majority in the Senate, but so far it has not been a "working" majority. The Senate has, since April 4,

given its time and thought to quarreling over committee places. The two Republican factions command respectively, 40 and 12 votes. The "regulars," without recognizing the "progressives" as a political entity, in drawing up its list of committee appointments, would allot to them approximately one-fourth of the Republican committee assignments, and, except for the cases of the Finance, Foreign Relations and Interstate Commerce committees, where Senators Cummins, Bristow and La Follette were not slated for membership, seem to have satisfied the radicals. On practically all of the important Senate committees except those named, and those on Rules and Privileges and Elections, the latter received not less than two appointments on each. The fate of Messrs. Cummins, Bristow and La Follette is not yet settled. Legislation waits on the decision. ——Senator Frye, the veteran Republican from Maine, has resigned as President *pro tempore*. His age and state of health account for the withdrawal.

In New York

Two grand juries, one of which heard Mayor Gaynor as a witness on police conditions, reported opposite opinions of the city police force in presentments filed with Judge Rosalsky of General Sessions in New York City, April 28. One said the police situation was a matter of grave concern; the other said the force was highly efficient. The Judge agreed with the first view, and said he considered the force demoralized, and that he had no confidence in the present police commissioner, J. C. Cropsey. In the course of his address to the grand jury Judge Rosalsky stated:

"The men have no confidence in their superiors. They will not make an arrest unless they are forced to by public outcry, and it is seldom, indeed, that a detective succeeds in detecting a crime and making an arrest. The figures of the last two grand juries show less than 500 complaints for less than 500 arrests, whereas I am certain that from 1,000 to 1,500 crimes have been committed."

There has been criticism of District Attorney Whitman, who has been held responsible for the "leakage" of grand jury news from day to day. "The law that prohibits grand jurors from revealing their transactions does not apply to the District Attorney," rejoins Mr. Whitman. In charging the May grand jury, Judge Mulqueen none the less denounces "circus methods" and "hunting crime with a brass band."——Deputy Police Commissioner William J. Flynn, an officer of the Government Secret Service "borrowed" by the municipality some months ago, resigned last week, stating at the same time that he had no quarrel with Commissioner Cropsey or with the Mayor, but that he must return to his regular duties. He has been succeeded by George S. Dougherty, head of the New York Pinkerton Agency. Commissioner Flynn has privately intimated that his was a "thankless job," and it is generally supposed that he was not allowed a free hand in his war upon the criminal classes. As Deputy, his greatest success has been in suppressing, or at least minimizing, public gambling. Flynn's resignation is a loss to the Police Department.——The resignation of Fire Chief Edward Croker has just taken effect. Croker had rendered the city efficient service for many years. He, also, denied that there was friction between him and his commissioner, Rhinelander Waldo, and based his resignation upon his desire to engage in a private enterprise of fire prevention.——Gen. Theodore A. Bingham, sometime Police Commissioner under ex-Mayor McClellan, is to re-enter the service of the city under the President of the Borough of Manhattan, as head of the Engineering Bureau. General Bingham has damage suits against Mayor Gaynor pending in the courts, but there seems little likelihood of these coming to a hearing.——Lloyd C. Griscom, former Ambassador to Italy, has resigned his chairmanship of the New York County Republican Committee, on the ground of bad health. Mr. Griscom fought on the side of Colonel Roosevelt in the factional battles of last fall. Samuel S. Koenig, ex-Secretary of State of New York, is regarded as Mr. Griscom's probable successor. Mr. Koenig is the candidate of the progressives. The "old guard" would prefer the election of J. Van Vechten Olcott, a New York Congressman defeated for re-election last November.

Against the Corruptionists Warrants for the arrest of Edward Tilden, packer, and George M. Benedict and William C. Cummings, bankers, of Chicago, were ordered by the Illinois Senate April 26, after these men had refused to respond to the subpœnas of the Helm committee, which is investigating the use of corrupt means in the election of William Lorimer as Senator from Illinois. Tilden is accused of having acted as treasurer of the "slush fund" of $100,000. On Friday the two were arrested on charges of contempt, and almost immediately released on a writ of habeas corpus, under bonds of $5,000 each.——After months of delay, the Stephenson senatorial election report is before the Wisconsin Legislature. It came in the form of a substitute resolution, in place of the one originally introduced, and is presented by the State Judiciary Committee, with Senator Bodenstaub dissenting. The resolution reviews the report and recommendations of the Senate investigating committee and requests that the United States Senate investigate the election of Isaac Stephenson. The resolution recommends concurrence in the findings of the Senate committee. The report also recommends that prosecutions be instituted by the district attorneys of Lane County and other counties, against all persons shown to have committed bribery.

The Dynamiters The McNamaras, John J. and James W., and Ortie E. McManigal, accused of blowing up the building of the Los Angeles *Times*, October 1, 1910, and of destroying bridges and other constructions in various cities of the Middle West, were safely transported to California last week, and will be placed on trial. James W. McNamara has been identified at Los Angeles as the "James Bryce" who stayed at a hotel there just before the date of the *Times* explosion. The accused will be vigorously defended by lawyers engaged by the labor unions the San Francisco Building Trades Council having pledged $100,000. Various labor unions have past resolutions protesting against the "kidnapping" of the accused, but in some cases these resolutions were voted down, on the ground that the facts have not been established. William D. Haywood, who, with Moyer and Pettibone, was similarly "kidnapped" in Denver and rushed to Boise City, Idaho, to be placed upon trial for the murder of Governor Steuenberg, plans with various union leaders and Socialists to persuade all workers to abandon work on the day when McNamara is placed on trial. Samuel Gompers, president of the American Federation of Labor, has declared his belief in McNamara's innocence and that organized labor's duty is to see that he has "a fair trial." McManigal has confirmed his confession, implicating the other prisoners, and refuses to confer with counsel. The former secret service man, William J. Burns, who brought about the arrest of the McNamaras and McManigal, and secured the latter's confession, gave himself up, April 27, there being a warrant out for his arrest on the charge of kidnapping, preferred by the union men at Indianapolis. He was afterward released on $10,000 bail. An investigation by the Marion County (Indianapolis) grand jury of the "dynamite conspiracy" is in progress. County Prosecutor Baker announces that the grand jury will inquire whether Indianapolis has been the seat of a conspiracy by dynamiters, and also whether there had been a plot by enemies of the International Association of Bridge and Structural Ironworkers to attempt, by "planting" dynamite in its office building, to convict it and its secretary, J. J. McNamara, of dynamite outrages. Burns is quoted as saying of the case against him:

> "All this row is raised because McNamara happens to be a union man. For my part I don't care whether a criminal is a union man or a non-union man. When I am after a criminal I am no respecter of persons."

The detective has received letters threatening him with death, and threatening the members of his family.

Madero and the Diaz Government After the armistice agreement had been signed, Madero invited the leaders of his forces in the north, his provisional Governors and Dr. Gomez to confer with him at his camp near Juarez. It was reported that the

office of Vice-President had been offered to him. He would not accept this office, he said, or any other unless it should be given to him by the people at an honest election. He was confident, he added, that there would be a peace agreement satisfactory to all revolutionist commanders. It is said that Madero knew two weeks ago what concessions Diaz would grant. For several days following the beginning of the term of the armistice, there were peace negotiations by telegraph between Madero's camp and the Mexican capital, altho no commissioners had been named. On the 28th, the Government appointed Judge Carbajal, of the Mexican Supreme Court, and agreed that the conference should take place at a point between Juarez and Madero's camp. Five days had been added to the term of the armistice. Rumors about the demands made by Madero were published, but they appear to have been mere guesses. There were indications that many of the rebel bands outside of the zone covered by the armistice would not be bound by Madero's action. The Socialists on the west coast did not acknowledge his authority. This was also the attitude of Ruez, Villareal and Guerra, commanders in Coahuila, the two last named being widely known as associates of Flores Magon, who in his paper (published at Los Angeles) called Madero a traitor. It was said that if a peace agreement with Madero should be signed, the task of subduing those who should persist in fighting would be assigned to Gen. Bernardo Reyes, who, at the beginning of the week was asked by Diaz to return at once from France. It is expected that Reyes, called "the idol of the army," will be made Minister of War. On the 29th, there appeared to be danger that the peace negotiations would be interrupted by the movement of 1,000 Government soldiers from Chihuahua City in the direction of Juarez. This was regarded as a violation of the armistice agreement. On the same day, the rebels besieging Ojinaga (across the river from Presidio, Tex.) began to bombard that place. But Ojinaga was not clearly included in the armistice zone.——At the Mexican capital, the Government leaders exprest a conviction that peace was near at hand. Diaz said he was ready to make any personal sacrifice. In Congress, during the debate upon the bill forbidding re-election, there was much plain talk. The old President was sharply criticised and repeatedly called a dictator by speakers who were loudly cheered. The bill was passed, with only one dissenting vote. ——Mexico has sent to London a formal protest against the landing of marines from the British cruiser "Shearwater" at San Quentin, on April 11.——After the arrival of Vice-President Corral at a Spanish port, an interview with him was published at the Mexican capital in the newspaper *Imparcial* (controlled by the Government) and also in *El Diario,* in which he said, as reported, that the revolution had been fomented by the United States in order that it might intervene and take Mexican territory. Our Government has asked the Mexican Government to repudiate this assertion, and Mexico has asked Corral to explain. Diaz says he does not believe Corral ever said it.——The Spaniards in Mexico have suffered so much loss, both of lives and of property, that 20,000 of them have petitioned King Alfonso for protection.——Madero and his associates, on the 30th, elected Dr. Gomez, Francisco Madero, Sr., and Jose Pino Suarez to act as peace commissioners of the revolutionists.

The Condition of Mexico

At the end of last week there had been no improvement of the internal condition of Mexico, altho hostilities had been suspended in the armistice zone. Elsewhere in the northern States the war was in progress, and in the south the situation was full of menace. Rebel bands were threatening Mazatlan, and on the 29th they began an attack upon that port. Colonel Morelos, a Federal commander, was quite successful, however, at Las Milpas, in Sinaloa, where he routed a rebel force led by William Clayton, an American. Clayton was killed, and his men retreated to Tamazula, in Durango, where Morelos whipped them again, and is said to have killed 300 of them. Later, he won an-

other battle at Rosario. In the south there were 5,000 rebels under arms in Puebla, and in the cities of that State there were processions of thousands of residents carrying banners bearing the words "Down with Diaz!" "Long live Madero!" The Governors of Guerrero and Morelos fled from their capitals, two mayors of cities in those States were assassinated, and there was no resistance to the revolutionists except in the city of Iguala. Twenty-eight new Federal recruits on a train approaching the national capital were attacked and slain, and with them a well-known civil engineer named Bustamente. In the State of Tabasco the Government was victorious, killing forty-five rebels in a decisive battle. On the 29th, the forward movement of the rebel forces from Guerrero and Morelos was checked, only 75 miles from the national capital, by an armistice, which the Government commander proposed. He received from the revolutionists a statement of their demands, and it was agreed that there should be a peace conference. Foreigners and many wealthy Mexicans are leaving the country.——One thousand students of the university at the capital have signed and sent to Diaz an address in which he is asked to resign and is criticised for procuring his own re-election and "forcing" Vice-President Corral "upon the republic."

The Islands

Carlos F. Morales, formerly president of Santo Domingo, Mauricio Jiminez, formerly vice-president, and General Zenon Toribio, some time ago an officer of the army in the same republic, were arrested at San Juan, Porto Rico, on the 24th ult., by the United States marshal, on the charge (said to be supported by papers found in their possession) that they were organizing a revolutionary expedition against Santo Domingo's Government. Application for their release on writs of habeas corpus was denied. They were bound over to the grand jury and, in default of bail, were placed in prison.——The Dutch recently took possession of Palmas Island, which lies 60 miles southeast of Mindanao, lowering the United States flag and raising the flag of Holland. It is understood that our Government, believing that the island has no value, will make no protest. Palmas has about fifty inhabitants and is not far from a group of islands owned by Holland.——Representative Cox, of Ohio, will urge his Democratic associates in the House to make the neutralization of the Philippines a party question at the present session. He will introduce a resolution asking the War Department for a statement showing the cost of the islands since they became possessions of the United States. Representative Sabath, of Illinois, has introduced a resolution providing that our Government shall strive to neutralize the islands by international agreements.

Central and South America

Rudolfo Espinosa, formerly Nicaragua's Minister at Washington, started from the Mexican capital, on the 23d ult., for Salvador, saying it was his purpose to organize a revolution in Nicaragua against President Estrada, who, he asserted, had become a tyrant, having imprisoned 400 prominent citizens and subjected them to torture. Our Government reminded Salvador of treaties which restrain it from promoting a revolution in any of the neighboring republics.——In New Orleans, some weeks ago, the captain and the owners of the gunboat "Hornet," which was used by Bonilla in his successful movement against the Davila Government in Honduras, were indicted for violation of the neutrality laws. They were recently brought to trial and acquitted.——Captain Willy Meyer, the German naval officer who was employed in February as commander of Hayti's navy, has returned to Germany. He became dissatisfied. The small Italian cruiser which Hayti had bought was not at hand and no one could tell him where the ship was. ——Engineers who will undertake the construction of a new railroad have arrived in Hayti. The concession was granted to an American syndicate, led by James P. MacDonald, of New York. The road will connect the interior with the four principal seaports. Large tracts of public land are given to the syndicate. It is said that the project is opposed by

influential planters, who allege that it involves discrimination in favor of the United Fruit Company.——Peru and Bolivia have agreed to be guided by the Royal Geographical Society of London with respect to questions of fact in their boundary dispute, which is to be laid before the Hague tribunal.

The Guildhall Peace Meeting

The meeting held in the Guildhall of the city of London at noon April 28 was an impressive demonstration of enthusiastic reception which the British Government and people have given to President Taft's proposals for unlimited arbitration between the two countries. The hall was crowded to its utmost capacity by representatives of various political and civic organizations, and upon the platform were the Lord Mayor and Sheriffs of London and the Mayors of the nineteen London boroughs, the Premier of New Zealand, the High Commissioner of Canada, the Archbishop of Canterbury, representing the Established Church, the Archbishop of Westminster, representing the Roman Catholic Church, the Chief Rabbi of the United Hebrew Congregations, the pastor of the London Tabernacle, representing the Nonconformists, and many other distinguished personages. The resolution brought before the meeting and passed read as follows:

"That this meeting of citizens of London, assembled in the Guildhall, cordially welcomes the proposal of the United States, in favor of a general treaty of arbitration between that country and the British Empire, and pledges its support to the principles of such a treaty as serving the highest interests of the two nations and as tending to promote the peace of the world."

The resolution was presented by Premier Asquith with the following words:

"The Guildhall has never been put to a worthier purpose than today. This movement is the result not of any ostensible or other prearrangement; it is spontaneous. The first move was made by the President of the United States and the seed he cast fell on ground well prepared to receive it. What a few months ago was a dream is now in the domain of practicability. It is the settled purpose of the two great peoples of Great Britain and America to make war impossible.

"Arbitration for the settlement of disputes between nations is already familiar to us, but hitherto points of national honor of vital import have been reserved and have not been referred to courts of arbitration. Now, whatever the magnitude of the interest may be, whatever poignancy of feeling may be involved, war will be absolutely abandoned.

"The compact now suggested has no ulterior political purpose. Our irenicon contains no threat to others. It is not an alliance offensive and defensive. It simply means that over the great area which we are responsible for war is forever ruled out. It is the privilege of great nations as well as of great men, not only to follow but to make precedents. If the United States and Great Britain make this compact it will be an immeasurable step in the progress of humanity."

Mr. Balfour, leader of the Opposition, seconded the resolution, and said in part:

"I in my private and public capacity shall leave no stone unturned to further this cause, which is nearer fruition than it has ever been before. Some people look with suspicion on what they call idle dreams and think that when a crisis comes the paper barriers of treaties will be swept away. I do not share that view. I admit that it is foolish to try to make a law go too far in advance of national opinion. I cannot imagine a greater disaster than that a compact such as we contemplate should be broken, for faith in such agreements would then be staggered for centuries.

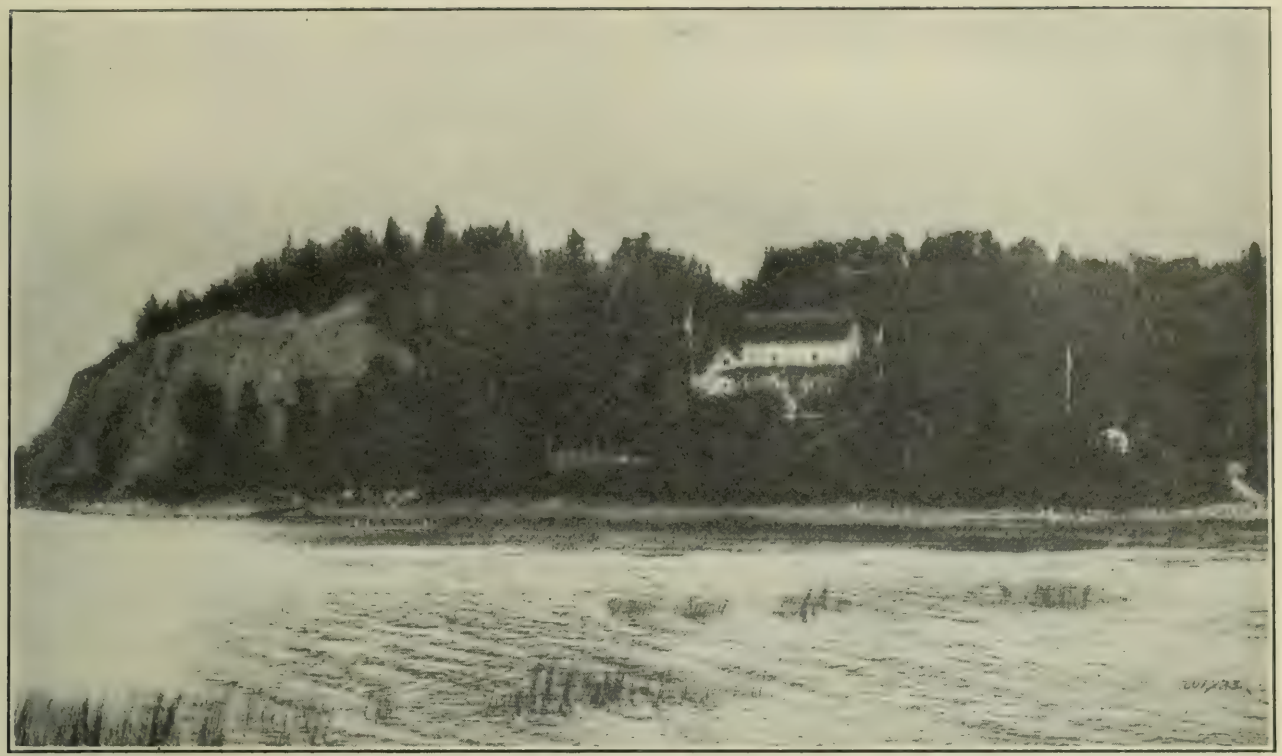
"However, it is not merely the religious opinion of the United States and Great Britain which favors this compact, but, I believe, the great mass of public opinion of all classes, and if skill in diplomacy can arrange the agreement I do not believe there is any danger of a subsequent breaking away from it.

"We must not mix questions of morality and war. The burden of the preparation for war and our responsibilities for the moment remain undiminished. This agreement will produce no immediate effect on that burden. However, that ought not diminish our zeal in pursuit not of an alliance or understanding, but in joining together to set an example to the world. It will be the beginning of a new era, the first attempt to reach a common bond between all civilized nations to abolish the barbarous arbitrament of war."

The press of the country has spoken heartily for the arbitration plan with the exception of the *Morning Post*, which denounces it as a Bismarckian scheme on the part of the United States to disrupt the British Empire. It holds that those who took part in the Guildhall meeting are dupes of President Taft, whose insincerity is shown by the fact that he has recognized the right of the Senate to decide whether or not any dispute is arbitrable.

Rioting in Canton

The rebellion against the Manchu rule has kept the city of Canton in a ferment during the week, and the issue is yet undecided. It is difficult to get reliable information of what is occurring inside the city because the gates are kept closed and the telephone and telegraph service is cut off. There are 30,000 soldiers inside the walls, but they have found it impossible to suppress the riots. The soldiers prefer to keep to the roofs of the houses, firing down into the crowds, rather than patrol the streets. The insurgents have manifested their activity chiefly in looting and burning the shops of wealthy merchants. Hundreds of buildings in Canton have been set on fire and there has been a considerable loss of life. One band of rioters, driven from the street by Manchu troops, took refuge in a rice store and defended themselves with bombs. The troops were unable to capture the barricade, built of hundreds of bags of rice, so they set it on fire and all the revolutionists either perished in the flame or shot themselves with their revolvers rather than be taken. An attack was made upon the yamen, the official residence of the Viceroy, which was captured and burned. The Viceroy, however, took refuge in the Admiralty, and his family is living on a gunboat. Li, the Taotai of Canton, was assassinated by the rebels. A number of anti-Manchu agitators have gone to Canton in order to develop the movement into a rebellion sufficiently strong to overthrow the dynasty. The jails in Canton are full of prisoners, and a great many of these captured by the soldiers have been shot, with little if any inquiry as to their guilt. Revolutionary conspiracies have also been discovered in Peking and Tientsin and numerous arrests have been made, including some prominent citizens.——The steamship "Asia," which struck on Finger Rock, was boarded by Chinese pirates after the passengers had been removed, and the vessel was looted and burned.



Opium in China

Contrary to the general expectation of foreigners the Chinese Government has proved itself competent to check and probably to abolish the opium traffic. When the edict ordering the suppression of the use of opium within ten years was issued in November, 1906, it was pointed out by the English papers that this was a greater undertaking than the abolition of the use of alcohol in other countries would be and that it could not be expected that so weak and corrupt a government as that of China would be successful. The British Government doubting the sincerity and competency of the Chinese authorities and realizing that the destruction of the English opium trade would play havoc with the finances of India, refused to comply with the request of China to stop the exportation of opium from India. The greatest concession which China could obtain from the British Government at that time was an agreement to reduce the exportation of opium from India to China at the rate of 5,100 chests a year for a period of three years, beginning January 1, 1908, provided China reduced the production of native opium in the same ratio, but China has done very much better than was expected and has not used the opium which she was entitled to receive according to this agreement. In the year 1907, 51,000 chests of opium were imported into China from India in the following year. According to the agreement China was to import 45,900 chests, but really imported only 42,122. In 1909, the amount imported was about the same, 42,183 chests, but last year the importation was reduced to 30,654 chests, instead of 35,700 as allowed. The reports of the British investigators showed that an immense decrease had been effected in the area of land devoted to the cultivation of the poppy, even in such large and distant provinces as Szechuan. The Chinese Government, calling attention to the fact that it expected to completely do away with the native production within two years, asked Great Britain to stop the exportation from India by that time, forbidding the sale of Indian opium into any provinces which had succeeded in suppressing the cultivation. But the opium dealers in the treaty ports believing that the anti-opium crusade would soon play out had accumulated in the treaty ports a

larger stock than they had been able to sell. The surplus stock now lying in the bonded stores amounts to some 20,000 chests, and its value is over $20,000,000, the dealers threatening to hold the Indian Government responsible for this amount if they were not able to sell it. But the Chinese reformers were now receiving support in England. The resolutions passed at the missionary conference in Edinburgh last year and the day of humiliation and prayer appointed for October 24, the fiftieth aniversary of the Treaty of Tientsin, by which Great Britain forced the opium trade upon China. had their effect upon the British people and Government. Consequently a new agreement has been drawn up between Great Britain and China, according to which British consent is given to the cessation of the importation of Indian opium as soon as China has completely suppress the growth of the poppy, and, second, to a triple increase in the duty of imported opium in the meantime. The opium in stock is to be disposed of without time limit, but in that case during the four subsequent years the total imports of opium from India will be reduced by a corresponding amount. The British Government at first insisted upon keeping the seven Eastern Provinces to the opium trade, but has finally consented to confine the importations to the two ports of Canton and Shanghai. The news that such an agreement was likely to be concluded has created great alarm in India which the Indian Government has endeavored to allay by the assurance that the agreement has not yet been concluded and that it realized the seriousness of the effect on the Indian finances. The Chinese anti-opium organizations have exprest their gratification at the action of the Chinese foreign office in securing concessions which will permit the abolition of the traffic within two years.

The Moroccan Situation

Major Brémond, leaving Tangier in command of a native force, has succeeded in reaching Fez April 26, in spite of the floods and the attacks of tribesmen on the way. Apparently he found conditions there less serious than had been reported. There has been no massacre and the danger of the capture of the city has been averted. The besieging insurgents have been repelled and are not holding together. Mequinez has, however, been captured by rebels, who have proclaimed as Sultan Mulai Zeen, full brother to Abdul Aziz, the former Sultan. It is feared that the American missionaries in Mequinez may have suffered in the rioting following the proclamation. A mixed force of French and native troops has left Rabat, on the Atlantic coast, for Fez, and will be followed by another column soon. But the effort to keep open a line of communications between the capital and the sea thru a country filled with hostile tribes will be a severe strain on French resources. The force under the command of General Moinier, at Casablanca, is now about 10,000, but is soon to be reinforced by several regiments from France and 1,500 Senegalese. About 9,000 men have been assembled in the Algerian frontier in preparation for an invasion of Morocco from the east in case that should be necessary. The new administration in France was put in power by the anti-military elements in the Chamber of Deputies, but its forward policy is apparently receiving good support, much better, in fact, than Premier Canalejas in his efforts to uphold Spanish interests in Morocco. It is impossible longer to conceal the fact that the Spanish Government is sending reinforcements to Ceuta and is obliged to co-operate with France in its aggressive movement. The French Government has notified the Powers signatory to the Algeciras Convention, including the United States, that active intervention on the part of France has become necessary to protect the foreigners at Fez, re-establish order thruout the country and safeguard the sovereignty of the Sultan. Great Britain has exprest its hearty approval of the proposed action, but Germany maintains a cold reserve. The Pan-German League demands the partition of the country, giving Germany the Atlantic coast line and its hinterland, claiming that France by its unnecessary incursions into Morocco, has violated the Algeciras agreement and reopened the Moroccan question.

Boys' Summer Camps

BY J. B. BRINE

[Mr. Brine has had much to do with boys' summer camps, and is now the director of a camp in New Brunswick.—EDITOR.]

A BOYS' summer camp—back to Nature, a free life under the whistling pines, with their ever permeating odor of balsam—what a wealth of incidents and reminiscences are instantly conveyed to the mind of the initiated. It is hard to find the reason for the irresistible lure of the woods, but who has not experienced the desire to spend some part of the year close to Nature and away from the never-ceasing rumblings of the city? An attractive opportunity for this enjoyment is offered to young America by the establishment of the boys' summer camp.

The development in the last ten years of the boys' summer camp is little less than wonderful. The first camp was started in Northern New England about twenty-five years ago, and on that foundation we now find at least one hundred camps for boys, thruout the northern continent. This development is all the more remarkable when we look back to the conditions of a decade ago. Then it was a luxury to go away for the summer. It was a pleasure only afforded to the wealthier classes; but still, on the other hand, if lucky, we might go and visit "Aunt Kate and the folks" for a few weeks.

The boys' summer camp started primarily to provide an outdoor vacation where the boys could get out and "rough it" for a couple of months. We now find a new element added to the vacation and pleasure side of the camp. The camps have appreciated the fact that a boy in good health and healthful surroundings is better able to study than in the close environments of the classroom. Owing to this fact, the camps have all added an educational department to their outfit, and employ a corps of expert college men as instructors and teachers.

Year by year the parents have come to realize the great benefits derived from camping. A boy may spend the entire winter months in a gymnasium and at the end of that time will not show half

the improvement or increased development gained by a comparatively short vacation in a camp. Here in camp a boy has all the benefits of fresh air in addition to the prescribed physical training, a combination unequaled for producing the desired results.

THE FIRST MEAL OUT OF CAMP.

All of the camps are now located with a definite plan. They must be on high ground, free from dampness and an overabundance of shade. It is highly important to have plenty of sun, as the canvas tents will retain a large amount of dampness from the night mists. In a first class camp the tents have wooden floors slightly raised from the ground and the walls so arranged that they may be raised to allow a complete circulation of air both thru and under the tent itself.

In general, all of the large camps are models of discipline and cleanliness, each boy taking care of his own bed or cot. For the most part, the neatness of the tents, both inside and out, would do credit to a government military camp.

Another important essential is that the greatest of care must be exercised in the selection of competent counselors, capable of exerting the best of influence over the boys. The influence of broad-minded men has a particularly marked effect on young boys. The college men that act as counselors are also promoting their own interests, as many are earning their way thru college, and this service helps to replenish their funds as well as enables them to enjoy a summer in the woods. These college men assist the head master, who himself is the assistant of the director, or nominal head of the camp. In this way the care of the boys is evenly placed on each man, and the boys receive the very closest individual attention. Tutoring is one of the most important features of camp life for those desiring it, so we can see that the counselors, in addition to their moral influence, must also be selected for their intellectual abilities.

In the majority of the large camps we find the following to be the usual routine of the day: The morning starts with a brisk plunge in the cool, inviting waters of the lake, followed by a short setting up drill. Breakfast is then served. I have designated several features as being important for a good camp, but by far the most important is the culinary department. The kitchen must be a model of cleanliness, as especially in summer the highest degree of efficiency must be maintained. To accomplish the best results in the kitchen most camps employ only the best and most experienced help in order to prepare in the most appetizing way the simple but substantial food required by all campers.

About nine o'clock the head master inspects the tents and we find a friendly rivalry among the boys as to who will have the neatest tent. Marks are given to judge what degree of neatness each boy may have acquired.

After the inspection the boys may take part in whatever branch of athletics they may desire, but always under the direc-

tion of experienced physical directors, who see to it that no boy is allowed to overexert himself. At eleven, the morning swim takes place, and here the popular parental fallacies are broken down. Most parents imagine that if they should send their sons to camp that they would be subject to all sorts of dangers that they would not encounter at home. As a matter of fact, a boy does not receive the close attendance at home that is given him at camp; when he is in swimming he has three or four of the counselors in constant attention, whereas at home he will in all probability wander off to swim in some treacherous river or lonely mill pond, where in case of danger no help would be at hand.

No boy is allowed to enter a canoe or rowboat until he has successfully passed the camp regulations. These regulations require all boys to show their ability, to the head master, in swimming with and without their clothing. In this way all danger is reduced to a minimum, and, in fact, I have never heard of a boy suffering any accident while at camp other than some slight bruise or cut.

Dinner is then served at noon and the afternoon is given over to what the boy may care to do. Should the camp be large enough to have a good ball team and play a schedule of games, the afternoon is devoted to the "big" team practice. One feature that appeals strongly to the boys is the trips that are taken in canoes and on foot. These trips range from a couple of days to two weeks and are always eagerly anticipated. On the day of the departure the camp is all excitement and bustle, pots disappear from the kitchen, the canoes are filled with blanket rolls and food, all to the accompaniment of cheers from the shore as the adventurers paddle off. These canoe trips always afford the boys great interest, for while en route they cook their own meals and at night pitch the tents. When in a train of lakes plenty of work can be had in hauling the canoes over the many portages.

Fishing is of course always very popular, and the opportunity for woodsmanship, mountain climbing and nature study is of course unexcelled. In short, a summer camping experience ought to tone up any boy's physical system and if the right kind of a camp is chosen his intellectual and moral nature as well.

New York City.

Twelve Major Prophets of Today

BY EDWIN E. SLOSSON, Ph.D.

INTRODUCTION.

FOR a long time past it has been hard to see the wood for the trees. Now we seem to be getting on to higher ground where we can breathe more freely and look about a bit. The twentieth century promises to be as characteristically synthetic as the nineteenth was analytic. The overthrow of traditional forms of government was followed by the overthrow of traditional forms of faith. But the intellectual forces which formerly seemed altogether speculative and destructive are today proving to be practical and creative. This turn of the tide involves a movement toward popularization. For while the philosopher may take the world to pieces in the privacy of his own study, he has to call on the neighbors to help him when he wants to make a better world. The result is that we have what might well be called a renaissance of philosophy. It shows itself for one thing in an astonishing increase in the number of books and periodicals devoted to religious, philosophical and ethical questions in America, England, France and Germany. Even more significantly perhaps is it shown by the increased attention given to such questions in popular novels, plays and general literature.

This is the first of a series of sketches to be published monthly in THE INDEPENDENT, the object of which is to acquaint the general reader with certain contemporary thinkers and to give in untechnical language some idea of their philosophy of life. In one way or another they are influencing the thought of all of us, but since we mostly get their philosophy at second hand—or at third, fourth or *n*th hand—we fail to recognize its origin and are apt to misconceive its intent. Ideas that reach us in fragmentary form, and often after multiple translation thru minds sometimes alien or hostile, are not very useful. It is always safer to drink at the source.

In the choice of the names to be included in the list I have been guided primarily by the idea that I should be most likely to interest others in the men who have most interested me. Since the object of the articles is to serve as an introduction to the works of the authors, not as a substitute for them, the choice was limited to those who have given expression to their philosophical views in sufficiently popular form to be comprehensible to the general reader. It was necessary to select representatives of diverse types of thought and it was not possible to confine the choice to the philosophical profession, for in our day philosophy has escaped from its classroom and often displays more activity and originality outside than in. So I have included men of science and letters as well as philosophers of the chair.

It would not be fair to exclude an author from consideration merely because his name had figured in the list of "best sellers," if he could reasonably be suspected of having a philosophy concealed somewhere about his personality. It sometimes happens that brilliancy of style blinds the reader to seriousness of thought, and even those who are most widely known as romancers or playwrights may still need an introduction as philosophers to their most devoted admirers or detractors.

Restricted to twelve names — for twelve is a sacred number to the periodical publishers, as it was to the Babylonians—I have chosen an equal number of representatives of philosophy, science and letters.

The first group comprises Henri Bergson, of the Collège de France, whose intuitive philosophy has been introduced into America by the late William James; Rudolf Eucken, of the University of Jena, who received the Nobel prize in 1908 for the greatest work in idealistic literature; F. C. S. Schiller, of Oxford University, exponent of the new humanism, and John Dewey, of Columbia University, who has had a wide influence on American education,

The group of scientific men comprises: Wilhelm Ostwald, of Leipzig University, recipient of the Nobel prize for chemistry in 1909, founder of the *Annals of Natural Philosophy;* Ernst Haeckel, of Jena University, veteran zoologist, champion of Darwinism and Monism, author of the "Riddle of the Universe"; Henri Poincaré, of the French Academy, mathematician and astronomer, and Elie Metchnikoff, director of the Pasteur Institute in Paris, author of studies in optimistic philosophy.

In literature: George Bernard Shaw, Fabian Socialist, writer of plays and prefaces, critic of the stage and all the world; H. G. Wells, author of scientific and prophetic romances, student of society and of individuals; G. K. Chesterton, journalistic philosopher, paradoxical champion of social and religious orthodoxy; Maurice Maeterlinck, dramatist and essayist, interpreter of the animate and inanimate world.

By nationality they are as widely distributed as by profession. The list includes representatives of Germany, France, Belgium, Russia, United States, Great Britain and Ireland.

Reading a book without knowing anything about the author is like listening to a lecturer from behind a pillar or a picture hat. We imagine we can understand a man better if we can see his face, even his photograph. This may be a superstition, but, if so, it is a superstition worth deferring to by one who aspires to be an interpreter. So I went to see these twelve men last summer, not with the hope of getting any new and unpublished opinions, not with the expectation of gaining a personal acquaintance that would give me any deeper insight into their mental processes, but merely to convince myself that they are flesh and blood, instead of paper and ink. If I can convince the reader of this my purpose will be accomplished.

Maurice Maeterlinck

Let us not forget that we live in pregnant and decisive times. It is probable that our descendants will envy us the dawn thru which, without knowing it, we are passing, just as we envy those who took part in the age of Pericles, in the most glorious days of Roman greatness and in certain hours of the Italian Renascence. The splendid dust that clouds the great movements of men shines brightly in the memory, but blinds those who raise it and breathe it, hiding from them the direction of their road and, above all, the thought, the necessity or the instinct that leads them.—*The Double Garden.*

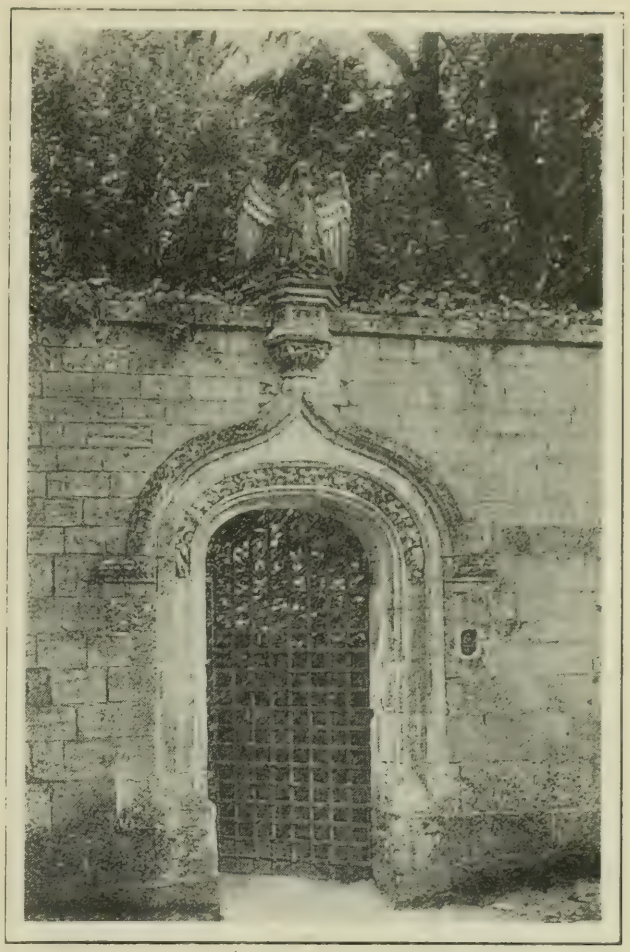
IT was half past seven in the morning of my last possible day in Paris, when the maid brought my chocolate, with a blue envelope on the tray addressed in the business-like writing of Maeterlinck; the long expected and at last despaired of note confirming the invitation received in America to visit him at the Abbey of St. Wandrille, and setting 5 p. m. as the time. No chocolate for me that morning. The concierge and I put our heads together over a French railway guide, more baffling than Bullinger's, and we made up our minds that a train started in that direction at 9, altho where and when it made connections we neither of us could make out. From Rouen on, I would have to trust to luck, or to the Government railway service—much the same thing.

The Gare St. Lazare is a long way from the Latin Quarter when one has got to make a train, but the cabman said he would make it, and he did. At Rouen, I discovered that in the course of the day one could get to Barentin, and from Barentin, a deliberate and occasional train went to St. Wandrille. But when I got to Barentin I found that the train was not going till the following day. It was getting near tea time and Maeterlinck seventeen miles away! Barentin would, under other circumstances, have interested me on account of the incompatibility of temper between the town and its environment, a cotton-spinning, socialistic population in the midst of an ultra-Catholic agricultural community. But as I strolled about, I took no interest in anything until I came to a little automobile repair shop. Here I found a young man who knew where he could find a machine and promised to get me to St. Wandrille in time for tea, or burst a tire.

It was a joy ride certainly in one sense of the word, and, I suspect, in two. The road, such a road as we rarely see in this country, wound around the hills overlooking the valley thru which the Seine twisted its way to the sea. The banks were flooded with the July rains, and the poplars were up to their knees in water. We gradually left behind us the smart brick houses of the new cotton aristocracy, and came into the older stone age. Along the railroad, as I was sorry to see, the meadows were beginning to grow the most noxious of American weeds, big advertising signs, but we soon escaped them, and saw around us only the grass and fields thru the double row of trees that lined the road.

THE VILLAGE OF ST. WANDRILLE.

As we got away from town, my extemporized chauffeur made better time, and under the stimulus of the acceleration, I recited passages of Maeterlinck dithyramb to "Speed," for he was the first to perceive poetry in the automobile:



> The pace grows faster and faster, the delirious wheels cry aloud in their gladness. And at first the road comes moving toward me, like a bride waving palms, rhythmically keeping time to some joyous melody. But soon it grows frantic, springs forward and throws itself madly upon me, rushing under the car like a furious torrent whose foam lashes my face. . . . Now the road drops sheer into the abyss, and the magical carriage rushes ahead of it. The trees, that for so many slow-moving years have serenely dwelt on its borders, shrink back in dread of disaster. They seem to be hastening one to the other, to approach their green heads, and in startled groups to debate how to bar the way of the strange apparition. But as this rushes onward they take panic, and scatter and fly, each one quickly seeking its own habitual place; and as I pass they bend tumultuously forward, and their myriad leaves, quick to the mad joy of the force that is chanting its hymn, murmur in my ears the voluble psalm of space, acclaiming and greeting the enemy that hitherto has always been conquered but now at last triumphs: Speed.

Afterward, when I recalled this essay to Maeterlinck, he laughed heartily and said he had written it when he had only a three-horse power automobile, one of the first kind made and altogether unreliable. Now he has a big one; also a motor cycle, but I do not know that he is writing prose poems on the motor cycle yet. He is likely to be the first to do it, tho, unless Rostand or Kipling get ahead of him, as they have in literary aviation: Rostand with a sonnet on the biplane and Kipling with his "Night Mail," wherein he invents and teaches a new technical vocabulary without slack-

ening speed. No wonder Kipling got the Nobel prize for idealistic literature. Maeterlinck deserves it on the same ground, for he, too, is entitled to write after his name the degree of M. M., Master of Machinery.

With the help of the machine I got to the little village of St. Wandrille even before the appointed hour, so I had time to drop into the queer old church. This is a favorite resort of pilgrims from all over Normandy and not undeserving of its repute, if one may judge from the crutches, canes and votive tablets left behind by those who have been cured or blest. Ever since 684 A. D., when Wandregisilus left the French court and founded this retreat in the forest by the Seine, it has been noted for its relics. The ossuary department indeed makes a fine display; skulls, thigh bones, vertebræ and phalanges, all laid out under glass and labeled neatly, as in a museum. Thirty saints I counted; besides the founder, St. Thomas Aquinas, St. Clotilde, St. Genevieve and St. Wulfranc. But most of those represented by relics or wooden statues were quite outside the range of my hagiography—St. Firmin, St. Mien, St. Vilmir, St. Wilgeforte, St. Pantoleon and St. Herbland.

But the village church is too modern to interest any one but an American. The old abbey, dating in part from the twelfth century, and belonging now to Maeterlinck, is across the road. Ringing at the little arched portal in the wall, I was shown into the cloister; very familiar it seemed to me, for I had a photograph of it in my room at home, a photograph showing three witches over a caldron, since it was taken when Maeterlinck's version of "Macbeth" was played here.[1] "The cloister of St. Wandrille is without doubt one of the most magnificent monuments of the kind that has escaped the vandalism of recent times," says Langlois in the large volume he devoted to its architecture.[2] Until recently the monastery was in the hands of the Benedictines, but they were dispossessed by the French Government on the separation of Church and State in 1907, and the property offered for sale. It was about to be sold to a chemical syndicate for a factory, when Maeterlinck intervened and purchased it, possibly more to please his wife than himself, for he is indifferent to surroundings, while she takes a keen delight in an artistic stage setting, not merely for the plays she enacts, but for daily life.

ENTRANCE TO THE ABBEY OF ST. WANDRILLE, THE HOME OF MAETERLINCK.

Certainly no author has been housed more satisfactorily to his admirers than Maeterlinck. He had, in fact, pictured it in his youthful plays. It is a verification of his faith that a man creates his own environment. The surrounding forest, the old house with its long corridors, the garden where the broken pillars and arches of the buried temple appear here and there among the vines and flowers, are the familiar scenes of all his dramas. All that is lacking is the sea, which is so often in his thoughts, and some dank, dark caves and dungeons underneath. But Maeterlinck does not need nowadays such sub-

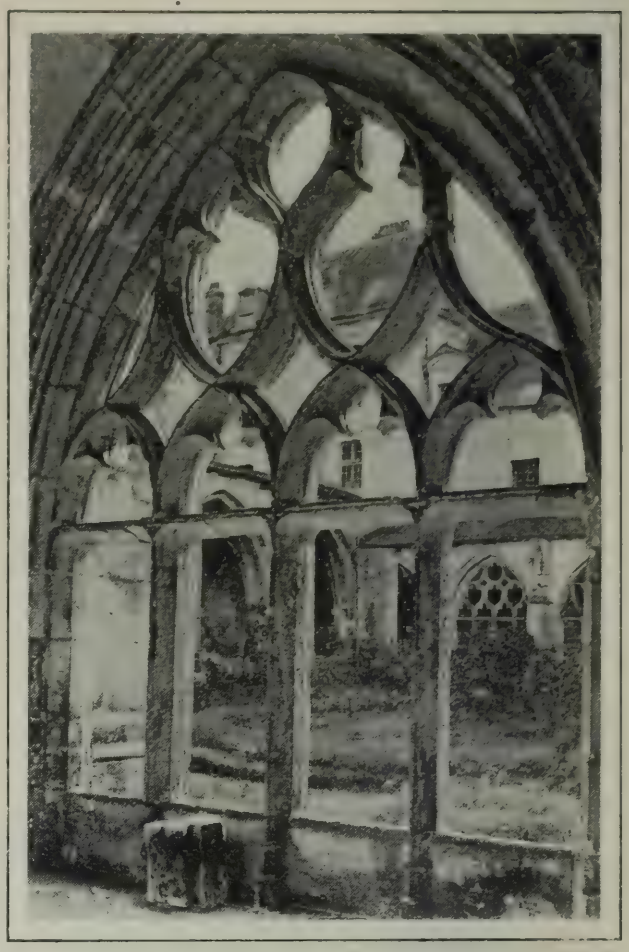
[2]L'Abbaye de Fontenelle ou de Saint-Wandrille. Paris. 1827.

terranean accessories, for he has passed thru his Reign of Terror, and come up into the sunshine.



It is curious that a man who is so modernistic in mind and who has shown so unique a power to idealize the prosaic details of the life of today, should place all his dramas in the historical or legendary past. But he always views the past as a poet, not as an archeologist, giving merely some beautiful names and a suggestion as to scene setting, and leaving it to the imagination of the reader to do the stage carpentering. Determinist tho he is, no one, not even James or Bergson, has been more bold in repudiating the right of the past to control our actions:

"In reality, if we think of it, the past belongs to us quite as much as the present, and is far more malleable than the future. Like the present, and to a much greater extent than the future, its existence is all in our thoughts, and our hand controls it; nor is this true only of our material past, wherein there are ruins that we perhaps can restore, but also of those regions that are closed to our tardy desire for atonement, and, above all, of our moral past, and of what we consider to be most irreparable there

"'The past is past,' we say, and it is not true; the past is always present. 'We have to bear the burden of our past,' we sigh; and it is not true; the past bears our burden. 'Nothing can wipe out the past,' and it is not true; the least effort of will sends present and future traveling over the past, to efface whatever we bid them efface. 'The indestructible, irreparable, immutable past!' And that is no truer than the rest. In those who speak thus it is the present that is immutable and knows not how to repair. 'My past is wicked, it is sorrowful, empty,' we say again, 'as I look back I can see no moment of beauty, or happiness or love; I see nothing but wretched ruins. . . .' And that is not true, for you behold precisely what you yourself place there at the moment your eyes rest upon it."[3]

While I was wandering in the cloister, puzzling over battered saints and mossy gargoyles, any disposition I may have felt toward monastic meditation was dissipated by the appearance of a woman, not merely a woman, but a modern woman, one who has gained vitality and initiative without losing the feminine graces, "the virile friend and equal comrade," as Maeterlinck calls her. Her costume was not inharmonious with the surroundings, for it was vaguely medieval in appearance—a hooded robe of some heavy blue

THE CLOISTER OF ST. WANDRILLE.

stuff, falling in long straight folds to her feet.

It is not necessary to describe Madame Georgette Leblanc Maeterlinck, for Maeterlinck himself has done that, sketching equally her virtues and failings with a loving hand.[4] Her powerful influence over his thought he gratefully acknowledges in the prefaces to his essays, and shows it by the frequent references in them to her opinions and personality. Monna Vanna, Joyzelle, and Mary Magdalene are roles written for her. We can tell when she came into Maeterlinck's life by the appearance of "the new woman" in his dramas; Aglavaine, who involuntarily overshadows and displaces the frail and timid Sélysette, Ariane, the last wife of Blue Beard, who releases his other wives from the secret chamber where they were confined, not killed as earlier rumor had it. The imprisoned sisterhood, who are, by the way, the anemic heroines of Maeterlinck's earlier period, Sélysette, Mélisande, Ygraine, Bellangère and Alla-

[4]"The Portrait of a Lady" in "The Double Garden."

dine, refuse to follow Ariane to freedom; they prefer to stay with Blue Beard, so she goes out alone. But she does not slam the door like Nora in "The Doll's House." It is not necessary nowadays to slam the door.

Madame Maeterlinck shows me the places she has picked out for the scenes of "Pelléas and Mélisande," soon to be played here, for she is the inventor of a new form of dramatic art based on the discovery that audiences are easier moved about than castles, trees and hills. Only the weather she cannot control, and the pathetic drama was played appropriately tho inconveniently in a rainstorm.[5] The ancient refectory which she used as the banquet hall in "Macbeth" is large enough to seat 400 Benedictine monks at table. It is roofed and paneled with carved wood and lighted by a row of large pointed windows set with bits of very old stained glass.

Here we are soon joined by M. Maeterlinck, a sturdy figure in Norfolk jacket and knickerbockers, for he was just in from a tramp in the woods with his dog. No, the dog was not his friend, Pelléas. Pelléas, as you should have remembered, died years ago very young.

Some say that Maeterlinck has a Flemish peasant face. Some say a Flemish bourgeois face. Not being familiar with the physiognomy of either the peasantry or the bourgeoisie of Flanders, I cannot decide this delicate question. All I can say is that it is a face one could trust, the face of a man one would like to have for a friend. The eyes, wide open and wide apart, are clear and steady. His hair is getting gray and he has in recent years shaved off his mustache, showing his straight, firm-set mouth and pleasant smile. His photographs do not do him justice, for none of them show him smiling—neither do his books. Early to bed and early to rise and much time spent in the open air have given him an erect carriage and a vigorous step. From the window of his study upstairs he points out to me his woodland stretching far up the hill, and he takes from his pocket the book that has occupied his afternoon, a book of trout flies. But I am more interested in other things, in the big worktable that occupies the center of the study, littered with papers, a typewriter on the corner of it. The wall opposite the window is lined with books, and as I glance over them I see his own plays and essays translated into half a dozen languages, Carlyle's works, Vaughan's "English Mystics" and many volumes of natural science, poetry and philosophy. M. Maeterlinck divines what I want most to see and takes down his Emerson, an old one-volume edition, in excruciatingly fine print, but manifestly well read, with numerous underlinings and as much annotation as the narrow margins would permit. It is curious that Emerson should have strongly influenced two such unlike men as Nietzsche and Maeterlinck.[6] But only the latter acquired his finest attribute, serenity of spirit. Maeterlinck also resembles Thoreau in his love for nature, tho he makes no affectation of asceticism or hermitage.

He spends his summers only at the Abbaye de St. Wandrille. In the winter he goes to the Riviera, to live with the bees and the flowers whose language he speaks. His winter residence is at Les Quatre Chemins, near Grasse, in the southeastern corner of the country. Here he is even more secluded than at St. Wandrille. He prefers the country to the city, not because he has any aversion to people in mass or to the mechan-

ism of modern life, but because he dislikes lionization and publicity of all sorts. He would stifle in the atmosphere of a Parisian salon. He belongs to none of the literary coteries combined for mutual admiration and the reciprocal promotion of individual interests. He has never been what Verlaine used to call a "Cymbalist."

As a mystic philosopher Maeterlinck finds a flower in a crannied wall sufficient to give him a clue to the secrets of the universe. Modern science, instead of killing mysticism, as was foreboded by despairing poets of the last century, has brought about a revival of it. This is quite natural, for mysticism is the verification of religion by the experimental method, as ecclesiasticism is the verification of religion by the historical method. The doctrine of evolution has given an intellectual basis and a richer content to the sense of the unity of nature, which is the force of mysticism. A weak poet, distrustful of his vision or of his own powers, fears science and flees from it. A great and courageous poet seizes science and turns it to his own uses. Tennyson and Sully-Prudhomme were among the first to perceive and to demonstrate the possibility of this. Maeterlinck, being of the generation born since the dawn of the scientific era, entered upon the inheritance of its wealth without having to pass thru any storm and stress period to acquire it. No traces of the fretful antagonisms of the nineteenth century disturb the equanimity of his essays. He sees no conflict between the scientific and poetic views of the world. He looks upon it with both eyes open and the two visions fuse into one solid reality.

Maeterlinck has been a leader in that characteristic movement of the twentieth century which might be called the reanimation of the universe. Time was, and was not so long ago but that most of us can remember it, when, terrified by the advance of science, man did not dare to call his soul his own. Naturally he denied a soul to the rest of the world. Animals were automatons; plants, of course, unconscious; and planets and machines out of the question. Nature was subjected to a process succinctly described as deanthropomorphization. To naturalists of the inanimate school an insect was not worth studying until it had a pin thru it. Animals were only interesting when stuffed.

Nowadays naturalists are going back to nature. They are leaving the laboratory for the woods. They have come to realize that studying zoology in a museum is like studying sociology in a cemetery. They have discovered that animals and plants possess not merely vitality, but individuality, and since man's real interest in the world he looks down upon has always been, tho he has often denied it, because he hoped to see himself there, a new school of fabulists has appeared who hold the mirror of nature up to us as Esop and Pilpay did of old.

Among them there is no one, unless it be Kipling, who is the equal of Maeterlinck. Like Tyltyl, he wears the fairy button on his cap which, when touched, brings out the souls of things. And, as in the "Blue Bird," the souls he has once released by the magic of his phrases from their material prisons do not get

back again. They remain visible to us ever after; not merely the souls of the dog and the cat, but of the bee, the oak, the bread and the automobile. He shows us the cat as a diminutive but undomesticated tiger to whom we are nothing more than an overgrown and uneatable prey. We see thru his eyes the cultivated plants as our dumb slaves, for "the rose and the corn, had they wings, would fly at our approach like the birds."

The "Blue Bird" cannot escape comparison with its rival on the contemporary stage, "Chantecler," but the similarity is superficial. They are as unlike in their philosophy as in their style. Maeterlinck has written a fairy story for children; Rostand a satire for grown people. Maeterlinck conceals his depth of thought under a dialog of simple and artless prose. Rostand disguises his trivialities in elaborate and artificial versification. The "Blue Bird" is really the offspring of the "Little White Bird," Mendel to the contrary notwithstanding. But Maeterlinck lacks the delicious humor with which Barrie had depicted his Peter Pan.

With Maeterlinck, personification is not accomplished thru falsification. His "Life of the Bee" is based on his own observation and wide reading, and is freer from error than most of the purely scientific books written on the subject. Such mistakes, in fact, as he makes, are accidental and never due to distortion or invention for the purpose of working in a poetic fancy or of pointing a moral. In fact, he does not point a moral. His nature studies teach no lesson unless it is the great lesson of kinship with nature. He does not, like Kipling, write an animal story with the aim of amending the budget bill or changing diplomatic relations. "The Life of the Bee" may be used as a socialistic tract. It may also be used as an anti-socialistic tract. "The spirit of the hive," as he interprets it, attracts some people and repels others. Lord Avebury, who is the leading English authority on ants and bees, is the head of the society for opposing socialism.

Maeterlinck is not one of those who set up animals on their hind legs to act as schoolmasters to men. He finds nowhere outside of ourselves, neither in the heavens above nor in the earth beneath, that justice in which mankind instinctively and inevitably believes. He is as largely pragmatic as Sumner in his derivation of morality:

"Between the external world and our actions there exists only the simple and essentially non-moral relations of cause and effect.

"In the course of adapting ourselves to the laws of life we have naturally been led to credit with our moral ideas those principles of causality that we encounter most frequently. And we have in this fashion created a very plausible semblance of effective justice, which rewards or punishes most of our actions in the degree that they approach, or deviate from, certain laws that are essential for the preservation of the race.

"Within us there is a spirit that weighs only intentions; without us a power that only balances deeds."[7]

This reads like a twentieth century supplement to Huxley's Romanes address.

Maeterlinck's sense of justice is more outraged by the calamities that result from the carelessness and malevolence of man than the disasters of earthquake and tempest. We are strange lovers of an ideal justice, he says; we who condemn three-fourths of mankind to the misery of poverty and disease, and then complain of the injustice of impersonal nature. And in reading a story of the "Arabian Nights," he is struck by the fact that the women of the harem, creatures trained to vice and condemned to slavery, give utterance to the highest moral precepts:

"These women, who forever are pondering the loftiest, grandest problems of justice, of the morality of men and of nations, never throw one questioning glance on their own fate, or for one instant suspect the abominable injustice whereof they are victims. Nor do those suspect it either who listen to them, and love and admire and understand them. And we who marvel at this—we who also reflect on justice and virtue, on pity and love—are we so sure that they who come after us shall not some day find in our present social condition a spectacle equally disconcerting and amazing."[8]

Maeterlinck stands quite aloof from politics, but not because he is out of sympathy with the tendency of the times. He has faith in democracy in spite of his clear perception of its faults and dangers:

"In those problems in which all life's enig-

[7] "The Mystery of Justice" in "The Double Garden."
[8] The Independent, January 3, 1901.

mas converge, the crowd which is wrong is almost always justified as against the wise man who is right. It refuses to believe him on his word. It feels dimly that behind the most evident abstract truths there are numberless living truths which no brain can foresee, for they need time, reality and men's passions to develop their work. That is why, whatever warning we may give it, whatever prediction we may make to it, the crowd insists before all that the experiment shall be tried. Can we say that, in cases where the crowd has obtained the experiment, it was wrong to insist upon it?"[9]

"It would surely have been highly dangerous to confide the destinies of the species to Plato or Aristotle, Marcus Aurelius, Shakespeare or Montesquieu. At the very worst moments of the French Revolution the fate of the people was in the hands of philosophers of no mean order."[10]

This democratic feeling seems to me to arise more from his mystical sense of the continuity of life than from personal disposition or political theory. In his earlier and more characteristic dramas the persons are hardly more than talking symbols. Their looks and costumes are not described, either in the stage directions or in the dialog. Their names—if he takes the trouble to give them names—are scarcely sufficient in some cases to indicate the sex. Their speech is language reduced to its lowest elements, excessively simplified, in fact, and full of the repetitions and incoherencies common to stupid and uneducated people the world over. Maeterlinck himself calls them "marionnettes," and says that they have the appearance of half deaf somnambulists just awakening from a painful dream.

But these puppet people are divested of individuality for the purpose of reducing them to the common denominators of humanity. They are devoided of personal interest in order to prevent the attention of the spectator from being fixt upon them. They are made transparent so that we may look thru them and perceive the external forces which control them. The dramatic poet, he says in the preface to his early dramas, "must show us in what way, in what form, in what conditions, according to what laws, and to what end our destinies are controlled by the superior powers, the unintelligible influences, the infinite principles of which, in so far as he is a poet, he is persuaded that the universe is full."

Great poetry he regards as composed of three principal elements:

"First, verbal beauty, then the contemplation and passionate depiction of what really exists around us and in ourselves, that is to say, nature and feeling, and, finally, enveloping the entire work and creating its own atmosphere, the idea which the poet has of the unknown in which float the beings and things he evokes, of the mystery which dominates them and judges them and presides over their destinies."

The critics were not altogether wrong when they called the characters of his earlier plays "mere shadows." But a shadow exists only when a bright light is cast on a real object. Maeterlinck's purpose is to make Plato's cave men aware of the drama that is being enacted behind their backs. The real action of these plays is not that seen on the stage. His dramas contain their message written in secret ink between the lines, and it becomes visible only when warmed by the sympathy of the reader.

At Mélisande's deathbed the wise old man sums up her character in the words: *"C'était un pauvre petit être mysterieux, comme tout le monde"*—"She was a poor little mysterious being like every one." "Like every one!" The phrase throws back a level ray of light, as tho it were a setting sun, and illuminates the road we have traversed. "Like every one," and all this while we had been thinking what an unnatural and absurd creature this Mélisande was, this princess who did not know where she came from or where she was going to, who was always weeping without reason, who played so carelessly with her wedding ring over the well's mouth, and whose words could never express what she felt. "Like every one"? perhaps . . . at any rate to be thought on, once it has been suggested to us. And in this connection we may consider a sentence in "Wisdom and Destiny":

"Genius only throws into bolder relief all that can and actually does take place in the lives of all men; otherwise were it genius no longer but incoherence or madness."

What fun Francisque Sarcey did make of "Pelléas and Mélisande," and of its admirers at its first representation in Paris in 1893. According to the veteran critic of *Le Temps*,[11] the play contained

[9] "The Double Garden."

[10] "The Mystery of Justice."

[11] See his "Quarante Ans de Théâtre."

a triple symbolism; one part not understood by the profane, one part not understood by the initiates, and one part not understood by the author. Maeterlinck was only a passing craze, he thought, due to the reprehensible fondness of the Parisians for anything foreign. Yet some fifteen years after that he might have seen in New York blocks of people standing for hours in the snow around the Manhattan Opera House to get a chance to see this same play, tho with the added charm of Debussy's music, this same play that the critics called "Maeterlinck's Sedan."

Even Richard Hovey, who first introduced Maeterlinck's plays to America in the days when the "Green Tree Library" flourished and bore its strange fruit, feared that "his devotion to the wormy side of things may prevent him from ever becoming popular." But he got over his devotion to the wormy side of things and has grown into a more wholesome philosophy, and so into a greater popularity. The transition point in his

From a recent copyright photograph by Dover Street Studios, London.

M. MAURICE MAETERLINCK AND MME. GEORGETTE LEBLANC MAETERLINCK.

style and thought is marked by the preface to his dramas, 1901. He neither recants nor apologizes for his earlier work, still less does he ridicule it, as Ruskin did his first writing, but he frankly and gracefully indicates the changed attitude toward life which shows itself in his later essays.

He ceases to use the word "destiny" exclusively in its evil sense, and to represent it as a power inimical to man, watching in the shadow to pounce upon us whenever we manifest a little joy. Fate in his later work does not always mean fatality, and events are controlled by character more than by external forces. Man by wisdom can overcome destiny. But Maeterlinck would have us take care to keep a sane balance of altruism and egoism:

"You are told you should love your neighbor as yourself; but if you love yourself meanly, childishly, timidly, even so shall you love your neighbor. Learn, therefore, to love yourself with a love that is wise and healthy, that is large and complete."

It is a curious transformation by which this Belgian lawyer and esoteric poet has become one of the widest known of French playwrights and moralists. He was born in Ghent, August 29, 1862, of an old Flemish family. The name, "measurer of grain," is derived from an ancestor who was generous in a time of famine.

He was educated at the University of Ghent for law, in accordance with the wishes of his family, tho he would have preferred medicine. But his dominant interest was always literature.

His experience at the bar was brief, a couple of criminal cases, and then he deserted the law and went to Paris for a year, where he was chiefly under the influence of the French symbolist, Villiers de l'Isle-Adam. Then he returned home to devote himself in quiet to the cultivation of his double garden of literature and science. He was especially attracted by the freshness and richness of Shakespeare and his contemporaries, and, as he says, drank long and thirstily from the Elizabethan springs. In Shelley and Browning he was also deeply interested.[13]

At the age of twenty-four, he began to contribute to *La Pléiade*, the organ of the "Young Belgians," a group of ambitious young writers, impressionists, seekers after novel effects of style, chiefly attained by means of transferring adjectives from one of the five senses to the other four. In the third number of this short-lived periodical was published Maeterlinck's first and apparently his last story, "The Massacre of the Innocents," a biblical incident reset in the times of the Spanish wars.[14] Here appeared some of the poems republished in 1889 in the little volume entitled "Serres Chaudes" ("Hot-house Blooms").

The cross-fertilization of Elizabethan drama with French symbolism gave rise to the "Princess Maleine," a new species if there ever was one, Shakespearean in form and incident, most un-Shakespearean in everything else. The first edition of this drama was an extremely limited one, twenty copies, printed on a hand press with Maeterlinck turning the crank.

It was the "Princess Maleine," which led to his "discovery" by Octave Mirbeau, who proclaimed it "the greatest work of genius of the times," and "superior in beauty to what is most beautiful in Shakespeare."[15] This newspaper praise made Maeterlinck instantly famous everywhere save in his own country. His neighbors in Ghent refused to take it seriously, and thought it a pity that his family should encourage the young man in his mania, by paying for puffs like that.

To trace Maeterlinck's dramatic development is like watching a materialization at a seance. His characters have become increasingly solid and lifelike, but they have lost the illusiveness and allusiveness that made their charm in his earlier plays. Maeterlinck has never been able to equal Ibsen—nor has any one else—in the art of making a perfectly individualized and natural character serve

[13]His admiration for Browning appears in his reply to Prof. William Lyon Phelps, of Yale, who had called attention to the close similarity between an incident in Browning's "Luria" and Maeterlinck's "Monna Vanna." Maeterlinck very frankly and courteously acknowledged his indebtedness to Browning, whom, he said, he regarded, like Eschylus, Sophocles and Shakespeare, as common sources of literary inspiration. THE INDEPENDENT, March 5 and June 11, 1903.

[14]This is signed by his name in its original form, Mooris Mäterlinck. A translation of this and other tales by Belgian writers by Edith Wingate Rinder was published in 1897 in the "Green Tree Library" of Stone & Kimball (now Duffield & Co.).

[15]*Figaro*, August 24, 1890. Octave Mirbeau is now engaged in booming Marguerite Audoux, the Paris sempstress who wrote "Marie-Claire."

also as a type or symbol, thus doubling our interest by combining the specific and the general.

Maeterlinck's genius shows best in his own peculiar field of symbolism and suggestion, that of his early dramas and of the "Blue Bird." His plays of a more conventional type, "Monna Vanna" and "Mary Magdalene," betray his deficiencies as a dramatic writer, his lack of the power of plot construction and a sense of humor. "Mary Magdalene" is really as much a one-act play as "The Interior," for the last act is the only one that counts. Here the crowd has the star part, the crowd of the lame, the halt and the blind, the sinners and the diseased, whom Jesus has cured and who now desert him; and the real drama is enacted, not in the upper chamber of the house of Joseph of Arimathea, but in the street outside, leading to the Place of the Skull. The scene of the woman taken in adultery is far less dramatic than in its biblical form, because in the play she is really protected by Roman swords, not by the awakened consciences of the mob.

The continuous development of Maeterlinck's philosophy of life is shown as well in his plays as in his essays. Mary Magdalene, who would not save her Saviour by the sacrifice of her virtue, represents a higher ethical ideal than Monna Vanna, who gives herself for the city. In his earlier plays Maeterlinck tries to frighten us with the traditional Terrors which in the "Blue Bird" are shown to be imprisoned and harmless in the Palace of Night. Old Time with his scythe, who as "The Intruder" of twenty years ago brought death into the household, appears now in the "Blue Bird" under a kinder aspect, calling the Children of the Future into life. In fact, the "Blue Bird" represents the highest point of the philosophy of optimism, for it is based upon the most daring of all the assumptions of science—that the secret of existence is also the secret of happiness. "To be wise is above all to be happy," says Maeterlinck. Truly he has got a long way from Schopenhauer, the object of his boyish admiration.

Maeterlinck has, in short, acquired a faith. I do not see exactly whom or what he has faith in, but he has faith, and that, after all, seems to be the main thing. The development of his thought has an especial interest in that it shows how a spiritual interpretation of the universe and a moral support can be built up on pure agnosticism. From Christianity he has derived little except a vague symbolism and certain ethical ideals. He looks back with bitterness upon his school days in the Jesuit college at Ghent, but his writings show no trace of the anti-clerical animosity which is so conspicuous in Haeckel's. From the mystics he has derived much, especially from the German Novalis and the Flemish Ruysbroek, whose works he has translated into French. In his preface to the latter he says:

> "Mystical truths have this strange superiority over truths of the ordinary kind, that they know neither age nor death. . . . They possess the immunity of Swedenborg's angels, who progress continually toward the springtime of youth, so that the eldest angels always appear the youngest."

But he undoubtedly owes his ethical and philosophical growth most of all to the study of nature, not the vague contemplation of natural objects which in the early Victorian era was thought proper pabulum for poets, but the effort to understand nature thru the use of modern scientific methods. We are reminded of Sir Thomas Browne, who says: "Those strange and mystical transmigrations that I have observed in silkworms turned my philosophy into divinity."

The reason why many poets and imaginative writers of high ability find themselves without influence in the modern world is, in my opinion, because they are ignorant of science or inimical to it. They, therefore, write for antiquity, which does not buy books, or for posterity, which, it is safe to say, will never come back to the position they hold. The people do not enjoy science, but their manner of thought is molded by it, and they are unaffected or repelled by music out of tune with it.

Maeterlinck does not seem to me so much an original thinker as an exquisitely sensitive personality who is able to catch the dominant note of the times in which he lives, and to give it artistic expression, as a musician upon a high tower might take as his key the funda-

mental tone of the streets below, modulating his music as the rhythm of the city changes, not to obtain applause, but because his soul is in sympathy with the life around him. In Maeterlinck's writings, various tho they be in form and topic, may be continuously traced the changing moods of the philosophy of the last twenty years, for he has always retained his sincerity of thought and courage of expression.

"To look fearlessly upon life; to accept the laws of nature, not with meek resignation, but as her sons, who dare to search and question; to have peace and confidence within our soul—these are the beliefs that make for happiness. But to believe is not enough; all depends on how we believe. I may believe that there is no God, that I am self-contained, that my brief sojourn here serves no purpose; that in the economy of this world without limit my existence counts for as little as the evanescent hue of a flower—I may believe all this, in a deeply religious spirit, with the infinite throbbing within me; you may believe in one all-powerful God, who cherishes and protects you, yet your belief may be mean, and petty, and small. I shall be happier than you, and calmer, if my doubt is greater, and nobler, and more earnest than is your faith; if it has probed more deeply into my soul, traversed wider horizons, if there are more things it has loved. And if the thoughts and feelings on which my doubt reposes have become vaster and purer than those that support your faith, then shall the God of my disbelief become mightier and of supremer comfort than the God to whom you cling. For, indeed, belief and unbelief are mere empty words; not so the loyalty, the greatness and profoundness of the reasons wherefore we believe or do not believe." [16]

HOW TO READ MAETERLINCK.

To those familiar with Maeterlinck the following, and perhaps also the foregoing, will be of no interest. But those who wish to make his closer acquaintance may find some suggestions not impertinent.

Maeterlinck's essays are published in English by Dodd, Mead & Co. in five volumes, $1.50 each; *The Treasure of the Humble; Wisdom and Destiny; The Buried Temple; The Measure of the Hours,* and *The Double Garden.* All except the last are in the admirable translation of Alfred Sutro. The order given is that of their publication in French (1896-1904). Any one of them will give the reader an insight into the character of his thought; *Wisdom and Destiny* is the most consecutive. If one has time for but a single essay read *The Leaf of Olive.*

For his treatment of nature see *The Life of the Bee* (Dodd, Mead; $1.50), essays in *The Double Garden,* and in *The Measure of the Hours,* and *The Insect's Homer* in *Forum* September, 1910.

Of his dramatic work the early mystical plays are most characteristic. The timid reader should avoid reading them alone after dark. Yet there is nothing supernatural in them—except the sense of the supernatural that permeates them. Nothing happens that cannot be given a rationalistic explanation—only the reader is not disposed at the time to accept such an explanation. Select your co-readers with care (all plays should, of course, be read aloud); avoiding particularly the hysterical giggler, for the effect depends upon maintaining the atmospheric pressure, and Maeterlinck treads close to the line that separates the sublime from the ridiculous and, as he himself confesses, he occasionally steps over. Read the original if you have any knowledge whatever of French, for the language is of the simplest and in these veiled dramas a slight additional haziness does no harm. (The French edition is published by Lacomblez, Brussels, in three volumes at 3 fr. 50 each; Vol. I, *La Princesse Maleine, L'Intruse, Les Aveugles;* Vol. II, *Pelléas et Mélisande, Alladine et Palomides, Intérieur, La mort de Tintagiles;* Vol. III, *Aglavaine et Sélysette, Ariane et Barbe-bleue, Sœur Beatrice.* Vols. I and II, trans. by Hovey, are sold by Dodd, Mead, in three vols., $1.25 each.) If you are doubtful of your ability to read "the static drama," or of your capacity to enjoy it, begin with *The Interior* (*The Home*). Here the tragedy is enacted inside the house, while all the talking is done outside. If you do not find it to your taste, read some author you do like. If you find a fascination in it, pass on to *The Intruder* and *The Blind.* This last affords unlimited scope to those who are fond of running down symbols. The dead priest in the middle of the group will stand for any form of ecclesiasticism you may have outgrown, and you can give the blind people around him the names of all the philosophers you know, according to the degree of their blindness and their reliance upon rationalism, intuitionalism, child psychology, animal psychology, etc., for a way out. But don't think you have to label them at all if you don't like to.

To understand the *Blue Bird,* all you have to do is to become a child. Then after you grow up again you may find that you understand it still better. It was first presented in Russia, where it is now being played by fifty-two companies. London and New York saw it before Paris, where it was last month put on the stage for the first time, with Madame Georgette Leblanc in the rôle of Light. (English version, Dodd, Mead, $1.25). Maeterlinck has taken out the forest conspiracy because it scared the children, and substituted a new act containing one of his most original characters, the Happiness of Running Barefoot in the Dew, who is apparently a daughter of Dr. Kneipp (the new act may be found in the Woman's Supplement of the London *Times,* December 17, 1910).

Mary Magdalene is now being played by Olga Nethersole, but may be as well read as seen. *Monna Vanna* is prohibited by the Cen-

[16] "Wisdom and Destiny," §79.

sor in England, but has been played in this country by Bertha Kalich, without offense. The only play by Maeterlinck that is at all "Frenchy" is one he translated from the English of John Ford. (Dodd, Mead & Co., publish *Joyzelle* and *Monna Vanna*, $1.25, and *Sister Beatrice* and *Ariane and Blue Beard*, $1.25; Harper publishes *Monna Vanna*, $1.20; Crowell publishes *Pelléas and Mélisande*, $1 and $1.50; R. F. Seymour, Chicago, publishes *Twelve Songs of Maeterlinck*, $1.50. Several of the plays can be found in back numbers of *Poet Lore*, sold by R. G. Badger, Boston.)

A list of over sixty references to books and articles on Maeterlinck was contributed by Montrose J. Moses to *The Book News Monthly* (March, 1909), and a more complete bibliography will appear in a life of Maeterlinck, by the same author, to be brought out soon by Duffield, $1.25. The sketch by William Sharp in the *Warner Library of the World's Best Literature* is remarkable for its insight, and the reader may also be referred to Huneker's *Iconoclasts*, Thorold's *Six Masters of Disillusion* and Harry's brief biography. The lover of Maeterlinck, whose affection is capable of being alienated, should beware of reading the very clever parody on his style in Owen Seaman's *Borrowed Plumes* (Holt, $1).

NEW YORK CITY.

O for the Farm

BY EMMA PLAYTER SEABURY

O FOR the farm with the spring on the hills,
And the valleys a-tinkle with ripple of rills,
With the lilt and the song of the robin and wren,
And the rollick of bobolinks up in the glen,
A breath from the south with a sweet verdure hint,
The leafing and budding and grasses a-glint;
The warm loamy meadows have droning and hum,
And whisper of billows of clover to come.

O for the farm with the lilacs in bloom,
Where the orchards are white with their wealth of perfume,
Where a pink and white shower rains down on the grass,
And carpets the turf at our feet as we pass,
Where the cattle come down the long lane with a fret,
And leave the lush pastures with munching regret,
And the plowboy goes whistling, his task to employ,
Where work becomes pleasure, and living a joy.

O for the farm, and the wood, and its scent,
And a hunt for the mosses with flowers besprent,
The vines reaching out from the great spreading roots,
The ferns reaching up with their soft plumy shoots,
The tassels that fringe all the trees overhead.
O give me the book of old Nature instead
Of the narrow walled city, its problems and wants,
And give me the music of Pan, and his haunts,
I am tired of men, O give back the charm,
And the sweetness and breath of the spring on the farm.

CHICAGO, ILL.

Will You Have a Gameless Continent?

BY WILLIAM T. HORNADAY

Director of the New York Zoological Park.

"In spite of all the boomin', it will never seem the same;
And the devil take a country that hasn't any game!"

Reflections of Cheyenne Jim.

THE American people are now called upon to face squarely, and answer, man by man, the question: Shall we have a gameless continent, or not?

It is a hard, ugly and miserably disagreeable question; but you and I have got to answer it, now,—for ourselves, our children, and posterity in general. Regarding our duty to wild life, we have lived in a fool's paradise until our lease has expired, and the day of reckoning has arrived. Shall we arouse and do what is vitally necessary to protect our miserable remnant of wild life, or shall we sleep on, and let it go to the devil?

Every vote in the New York Legislature against the Bayne-Blauvelt bill to suppress market shooting and the sale of wild game is a clearly-cut, straight, wilful-and-knowing vote for the extermination of all the feathered game of New York, New Jersey, Pennsylvania, Connecticut and Massachusetts. Let us make no mistake about this; for the facts alleged in this case have not been denied, and they can not be disproven. The extent to which ruffed grouse illegally killed, and illegally shipped in Connecticut and Massachusetts, is bought on the sly and consumed in New York City is a disgrace to every voting citizen of the Empire State.

We are maintaining here a gigantic "fence" for the sale, *out of season*, of game illegally killed in sister States,—and also in our own State! Last year the Connecticut Fish and Game Protective Association expended $450 in hiring detectives to catch the men in Connecticut who were shipping out-of-season grouse to the New York market; but the lawbreakers were too shrewd to be caught.

The destructive influences that are operating with such deadly effect everywhere east of the Alleghanies are not confined to the East. They prevail all over the United States; and the worst of it is that they can not be wholly eradicated without a great general movement on the part of the mass of the people, State by State. As every one knows, the great mass of people, even the decent majority, is so hard to reach that nothing short of a great earthquake, or a war, or a famine, is sufficient to sting it into action. We are, as a nation, the most easy-going people on earth. Many a man who is robbed is too lazy to report the crime to the police. There is much grumbling in the family circle, but the most of it ends there, long before the hour arrives for father to go to the office.

The fatal weaknesses in our national attitude toward wild life are easily catalogued and exhibited, and their widespread prevalence is horribly evident. Here is the list:

1.—The killable game has been reduced to so low a point that, speaking generally, we have today in the United States not more than one bird and one quadruped for every ninety-nine that we had forty years ago. If any one doubts this statement, I will ask him to wait for the report on the former abundance of our game that presently will be published by Mr. E. H. Forbush, the efficient State Ornithologist of Massachusetts. He has shown me some of his figures, but I do not propose to forestall him on this subject.

2.—*As the game has grown more and more scarce, the number of guns and gunners has rapidly increased!* Today, the number of hunters in the United States is enormous. In New York State there are, according to a careful estimate made by Mr. Andrew D. Meloy, president of the New York State League, about 300,000 *active* gunners, who hunt at least once every two years. Does not that mean about thirty hunters for every ruffed grouse, and fifty for every woodcock and quail. Imagine what it means

for an army of even 100,000 armed men to take the field every year in this State against our miserable remnant of game birds! In Pennsylvania the men who constitute the majority of her grand army of shooters (at least 100,000) are too mean to vote a hunter's license of $1 per gun *to be expended in protecting the interests of the game!* But then, it must be remembered that Pennsylvania once was the home of "the Fool Hawk Law," that cost her farmers over a million dollars in two years.

3.—*Our killable game is being exterminated according to law!* In other words, the laws are so liberal to the killers, and so hard on the game, that the game is swiftly vanishing. Laws that are adequate to preserve the game, and permit it to increase ever so little, are called "drastic"; and the men they most affect "won't stand for them"—that is, *if* we consult their wishes about them!

4.—*The commercial interests of game-selling, gun-making, and feather-working are terribly destructive influences.* It has been demonstrated over and over again, all over the world, that *no wild species can withstand exploitation for commercial purposes!* In every case it spells speedy extermination. Even the whales of the sea can not survive the modern steam whaler and the awful harpoon cannon. Look backward at the American bison millions, the fur seal millions, the passenger pigeon millions, the pinnated grouse and quail millions, the South African elephants, the Guadalupe elephant seal, the great auk, the egrets of Florida and Mexico, the mule deer of Colorado, the alligator of the South, and the beaver of the North! Where are they all? Destroyed, annihilated, exterminated, by greedy and rapacious men who wished to convert their remains into cash. Soon the musk-ox will follow them.

How much longer is Christian "civilization" going to stand for such doings.

5.—The majority of the American people are humane, just, merciful toward all creatures, and conscientious. It is on this fact that the future of this nation rests secure. Once arouse that majority, and it will right any wrong, in nation, state or municipality. It is to that great, patient, easy-going but God-fearing and forceful majority that the remnant of wild life must appeal for its preservation,—if it is to be saved at all. Whether it is possible to make that appeal so loud and so long that it will reach and arouse the majority is yet a grave question, a question literally of life or death! Opposed to the decent majority is a minority that I will touch upon a little later.

6.—In the making of adequate laws to stop abuses, and really promote the increase of wild life, the destroyers who are hit always raise a great outcry, and protest that the restrictions should be put upon some other fellow. For instance, the makers and users of the murderous automatic and "pump" guns,—deadly machines for bird slaughter, no more, no less,—always cry, "Enforce the game laws! Limit the bag! Shorten the open season! Do anything you like to restrict hunting, but DON'T touch the automatic and pump gun! Don't interfere with an INDUSTRY! Don't hamper Inventive Genius!!" These are the very words that I have heard in my office and elsewhere, a score of times at least, from representatives of the companies who make the guns.

The game-dealers say, "Stop the killing of game by sportsmen, and then game will be plentiful!" A very ingenious theory, truly. The only trouble about its application lies in the fact that it aims to antagonize the very men whose efforts have done most to preserve to us the ragged remnant of game that exists in this land today.

7.—We come now to a destructive cause that no patriotic American can mention without a distinct feeling of regret and shame. I refer to the lawless, reckless, conscienceless and vicious minority that defies all laws, all codes of ethics and all rules of decency in securing the utmost toll of wild life. In this land of too much liberty, and at times of disgusting license the lawless 10 per cent. is everywhere present. From Portland, Maine, to Portland, Oregon, and from Point Barrow to Brownsville, there exists everywhere a certain number of men who will break any game law that can be broken with a fair chance of immunity, and in the taking of wild life will employ every unfair advantage that the

devilish ingenuity of the meanest man can devise. There are plenty of men who will dynamite fish, snare ruffed grouse for market, steal breeding trout freshly placed in depleted streams, kill quail on their nests, kill robins, snow buntings and bluebirds for food, and shoot regardless of the scarcity of game, or of bag limits. When G. O. Shields coined the word "game-hog," he introduced into the nomenclature of shooting and fishing one of the most useful and necessary words that ever entered it. No wonder that a judge on the bench has officially recognized its existence and its usefulness.

Take a case by way of illustration:

At the hearing at Albany on March 29, on the Bayne-Blauvelt bill to suppress the sale of game, it was stated in the speech of the delegate representing the Sportsman's Association of Rensselaer County that in that region there are men making a business of snaring ruffed grouse illegally for the market; and "they send out their wives and daughters to take the grouse out of the snares, because, even when they are caught in the act, no jury will convict a woman of breaking a game law in Rensselaer County!"

In the State of New York, *there is no bag limit on ducks, or other wild fowl.* I know a Massachusetts game-hog who went to Great South Bay, and in two days slaughtered ninety-four ducks; and he told me of it afterward without the slightest sense of shame.

New York needs a bag-limit law on ducks, and she must have it, at an early date,—for the sake of public decency, if for no other reason.

8.—The favorite weapons of the market gunner and the game-hog are the automatic gun, of five shots with five pulls of the trigger, and the "pump" gun of six shots in about three seconds. And why? Because they are the deadliest guns to be had for money, and can be trusted to get far more game than the finest double-barreled gun. They give the game literally "no show"! In the hands of an expert market gunner, it is often possible to kill five ducks out of a single flock, and I have one record of eight from one flock—*all that were in the flock!*

The supreme deadliness of these guns is fairly beyond question. Their sponsors reply, "Limit the bag, and *enforce the law,* and it won't make any difference to the game what kind of a gun kills it." That old cry of "Enforce the law!" on the bag limit is like wiring to a starving man, "Feed yourself!" *It can not be done!* No sensible person needs to be told why.

The use of the unfair guns in hunting wild game should be everywhere prohibited by stringent laws, until each gun is reduced to a two-shot capacity. Among real sportsmen there is no room for argument on this subject. With game as horribly scarce as it is today, no gentleman sportsman can use an automatic or "pump" gun in hunting. In my circle of friends there are several who own such guns but now never use them, because their consciences will not permit them to do so. Pennsylvania prevents the automatic gun by a law that has been declared constitutional, in one of the strongest decisions ever rendered in a wild-life case. In nearly all the Provinces of Canada the same kind of a law is in force.

9.—*The sale of game, and the premium that it pays on the regular business of market shooting, is the chief cause of the awful decrease of our feathered game.* Today twenty-four States prohibit it by law; and those States contain a total of 43,000,000 people. But of the States bordering the Atlantic, only South Carolina maintains a serious embargo on the sale of game. As a result, the game-dealers of the big cities are reaching out their rapacious hands into every nook and corner of the East and South that still contains ducks, grouse, quail, woodcock, snipe and shore birds. *At this moment* there now lie in cold storage in New York City the following dead birds:

Wild ducks	98,156
Plover	48,780
Quail	14,227
Grouse	21,202
Snipe	7,825
Woodcock	767
Rail	419
	191,576

Now, it is a fact that none of our neighboring States permit the killing

and exportation for sale of any of their game birds! New York laws forbid the sale of any of her quail, ruffed grouse and woodcock, at all times. And what is the inevitable corollary of these facts?

Beyond question, at least 75 per cent. of all that dead game was *taken illegally,* is now *illegally possessed,* and eventually will be illegally consumed. The trouble is, we cannot prove in court the *sources.*

The greatest scourge to the wild game of the East is the sale of game. From Maine to Florida, that should be stopped immediately and forever, for *all* wild game. At the same time, laws should be enacted to permit the possession, transportation, sale and consumption of domestic game, bred and reared in fenced preserves, of the following species: pheasants (*not* ruffed grouse), mallard duck, black duck, white-tailed deer, elk, European red deer, fallow deer and roebuck. This is the legislation that we desire to have enacted at Albany at this session. Watch the Bayne-Blauvelt bill; and ask your Senators and Assemblymen far and near to vote for it until it passes. If any of them vote against it—what will you do about it?

The salvation of our wild life now depends upon the average citizen, and what he conceives to be his duty toward it. The need of the sportsman for game to shoot is not in my estimation the consideration of first importance. The wild life is worth most, as a public asset, to the millions of men and women, boys and girls, who love the outdoor life, the woods and the waters, but *who do not shoot at all!* The wild birds and beasts should be preserved for them.

How can it be done?

By creating a demand for it!

The great majority of law-makers are quick to respond to the voice of the people. Ask for a Bayne bill against the sale of game; a bill to shorten all bag-limits and open seasons; a bill for a long close season for any species that is threatened with extermination in any State; a bill to prohibit the use of automatic and pump guns in hunting; a bill to prohibit spring shooting; and a bill to prohibit the use of the plumage of wild birds for millinery purposes, excepting game birds.

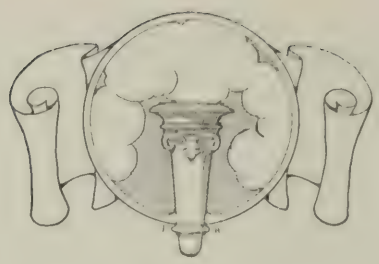
The great interest, aye, even the enthusiasm, that has been aroused in New York in support of the Bayne bill proves once more what can be done whenever the people are reached by the news of a grave danger. The saving of the wild birds and beasts and fishes is a campaign of publicity and education. The legislation and repression will follow as day follows night. Congressmen and legislators can be depended upon to do the right thing provided they are *asked sufficiently* by the people they represent.

Unfortunately, large sections of the press are apathetic. Altho a number of newspapers, beginning with the New York *Times* and ending with the Buffalo *News,* have given the Bayne-Blauvelt bill splendid support, a great many newspapers whose duty it was to offer support signally failed to accord it. In such a cause editorial indifference can easily become a misdemeanor against wild life. Toward the harried and hunted wild things we owe a duty as good citizens that we can not evade without impairing our good citizenship. Far too long has this work been left to a corporal's guard of sportsmen and bird lovers and naturalists, poorly supplied with campaign funds.

We have seen six species of birds exterminated in our own time. Fourteen other species are now on the high road to extermination in the near future. Here are the two lists:

THE FATE OF TWENTY SPECIES OF OUR AMERICAN BIRDS.

Already Extinct.



Great Auk.	Carolina Parrakeet.
Passenger Pigeon.	Flamingo (in the U. S.)
Labrador Duck.	
Eskimo Curlew.	

Next Candidates for Early Extinction in the United States.

Trumpeter Swan.	Willet.
Whooping Crane.	American Egret.
Roseate Spoonbill.	Snowy Egret.
Red-Breasted Sandpiper.	Wood Duck.
	Sage Grouse.
Bartramian Sandpiper.	Prairie Sharp-Tailed Grouse.
Golden Plover.	Pinnated Grouse.
Dowitcher.	

The fight for the remnant of wild life is on. Where do *you* stand?

NEW YORK CITY.

Old-Age  Pensions

BY W J. GHENT

Author of "Our Benevolent Feudalism," "Mass and Class," Etc.

ALONG with the increasing demand for workmen's compensation for industrial accidents comes the demand for old-age pensions. It would seem—would it not?—that if we can pay pensions to men who, as soldiers, have destroyed lives, we might also pay pensions to men who, as toilers, have protected and sustained lives. But in this matter, as in most other matters relating to the protection of workers, America lags far behind the rest of the world. Germany enacted an old-age and invalidity pension measure in 1889, Denmark a pension measure in 1891, Italy and New Zealand followed in 1898, New South Wales in 1900, and Victoria in 1901. Austria enacted a limited measure in 1906. In 1908 Australia passed a general pension law, which superseded the New South Wales and Victoria laws, and in the same year both Canada and Great Britain followed with other measures. In 1910 France revised its former pension schemes and enacted a comprehensive law, and somewhat similar laws are now under consideration by both Sweden and Norway. No American State has so far established a general system of old-age pensions.

Nevertheless, the subject, even here in backward America, is becoming more prominent day by day. A recognition of the duty of society to aid the veterans of its army of toil is becoming general. In several States commissions have investigated, or are now investigating, the subject. The Illinois commission of 1905, adroitly evaded it, but the Massachusetts commission of 1907 gave it a fairly thoro inquiry, tho an adverse report was presented (House Report, No. 1,400, 1910). In the meantime the matter has been brought before Congress by the bill of the Hon. W. B. Wilson, the Democratic-Labor representative from Pennsylvania. Another bill will be presented to the present Congress by Hon. Victor L. Berger, the Socialist representative from Wisconsin.

The problem is one readily recognizable by every observant being who looks about him at the mass of misery caused by the insufficient incomes of aged men and women. But, unfortunately, here in America we have few authentic figures to guide us. Perhaps the only figures of much value are those gathered by the Massachusetts Commission and published in its report. The cases of 3,746 non-dependent poor, sixty-five years of age and over, were examined, with the following results: Among individual males, 39.3 per cent. received less than $5 a week, 40.7 per cent. received from $5 to $10 a week, and 21 per cent. received more than $10. Among females 79 per cent. received less than $5, 18.7 per cent. from $5 to $10, and only 2.3 per cent. more than $10. The weekly average for the males was $7.32; that for the females $4.50. Those living in couples or families had larger incomes, but the average was far below the amount needed to support life decently. These are but a few picked cases from one State. We have nothing authentic to enable us to judge the proportion of aged poor to the whole population.

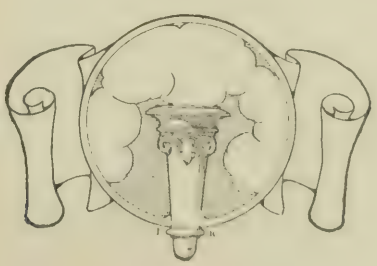
Old-age pension schemes are of many kinds. It is not necessary here to mention the private schemes—those which a railroad or a manufacturing company may propose or adopt—since the growing demand is for a State system, one in which society as a whole acknowledges its obligations to the veteran toilers. The State systems, actual or proposed, are classified in the Massachusetts report as follows:

1. Universal non-contributory.
2. Partial non-contributory.
3. Compulsory contributory, with State subsidy.
4. Voluntary contributory, with State subsidy.
5. Voluntary, under public administration.
6. Voluntary, under public supervision.

Under the first system every citizen above a certain age would be entitled to a pension, without any contribution to the fund. No nation has yet adopted such a system.

The second type is embodied in the British and Australian acts. The minimum age is seventy years in Great Britain, sixty-five years in Australia. The maximum pension is $1.20 weekly in the former country, $2.40 in the latter country. In both countries the pensioner must be "deserving" and must be a resident of at least twenty-five years' standing. If in Great Britain his yearly income is more than $153, or in Australia he owns property worth more than $1,500, he is not eligible. No contribution is required from the pensioner; the State furnishes all the funds. The Danish system is also non-contributory.

Germany's act embodies the third type. Insurance is compulsory for all wage-earners and for certain salaried persons receiving less than $500 yearly. The workman, the employer and the State all contribute to the fund. The pension begins when the workman reaches seventy years. It is pitifully small; in 1907 it averaged only $40.41. The new French law is, in the main, modeled on the German system, tho the pensions are much larger.



The Belgian act embodies the fourth type. The State contributes to the insurance funds which have been voluntarily saved thru the State annuity department. The pension may begin after the fifty-fifth year. A supplemental and restricted system of non-contributory pensions is also in force. The fifth and sixth types of pension schemes are too inadequate to warrant consideration.

There are thus two general types of pension schemes—the contributory and the non-contributory, the one in which the worker pays, the other in which he pays nothing directly. Of course either scheme may be either partial or inclusive: it may take in a few workers or all workers: while the contributory scheme may furthermore be either voluntary or compulsory. Each scheme, as well as every possible variation of either, has its defenders and opponents.

The opponents of State action in this matter assert that the results of an old-age pension measure in America would be deplorable. Any kind would be bad enough, they say, but a non-contributory and inclusive one would be ruinous. For one thing it would be unconstitutional. This assertion may or may not be true; but even if true, constitutions are amendable things, and no constitution can long withstand a united popular demand.

Society owes a debt to its aged workers. They have produced enormous wealth for others, but they have been enabled to save little or nothing for themselves. They should not be taxed for this pension. By the time they have reached sixty years they have already made their contribution: nothing that society is ever likely to pay them will remotely approximate the unpaid values which have been taken from them during their years of toil. They are entitled to end their days in comfort, and to enjoy that comfort, not in the confinement of an almshouse, but in entire freedom.

WASHINGTON, D. C.

Be Clever, Sweet Maid

BY THE BACHELOR MAID

DISILLUSIONMENT is the lot of all. I do not know, as I review the various shocks thru which my cherished beliefs have toppled, one by one, that the path of my past is strewn with more ruined hopes and dreams than that of any average fellow creature. But I do sometimes think that in respect of one thing which seems to form a bulwark for the mental serenity of mankind in general I have been singularly unfortunate—if mental serenity is the ultimate in good fortune. For I have never been able to blind myself to the flimsiness and easy destructibility of the sundry proverbs and maxims behind which others take refuge with unquestioning confidence in their impenetrability, and upon which they found their argumentative structures as if upon a solid rock. The list of those in which I have lost confidence is long, but at the present moment I am moved to speak especially of my conviction that to the numerous adages and quotations long accepted as Gospel when they are in truth most pernicious fallacies should be added that which prescribes, "Be good, sweet maid, and let who will be clever."

I cannot but observe in passing that, if the truth were told, I believe that we do not estimate goodness very highly among the attributes to be desired. Have you never noticed how we treat it as the mere fag-end of complimentary terms when we have run thru the whole list and found nothing else that seems applicable to the individual under consideration? We say, "Oh, well! she's a *good* woman, and maybe she can't help being disagreeable," or "Yes, he's a dreadful bore, but then—he's *good;*" and we know perfectly well that that is the last thing we ever wish to have said about *us*. From which I gather that goodness is one of several virtues which we praise rather by reason of tradition than of conviction. I speak, of course, rather of goodness as practical than of the beautiful ideal. And I dare to proclaim, however iconclastic the proclamation may be, that in that beautiful ideal there is no real goodness which is divorced from cleverness. I am using cleverness, too, in its best sense; not as that shallow endowment which makes its possessor merely "smart," but as that combination of natural ability and thoro mental training which, once attained, permeates the whole being of its possessor with enduring qualities quite eclipsing "the smile that won't come off."

I do not propose, certainly, to be tempted into any sweeping assertion that I would not trust a woman unless she had been to college, because I am conscious at this moment of too many personally known exceptions on both sides to such a generalization. But if all the collegiate and non-collegiate acquaintances of my life could be ranged before me in two separate groups, I know to which one I should unhesitatingly turn for sympathy, for justice and for *lasting* friendship. The "feminine" and "domestic" women of my experience, that is to say, the superficially educated and purposeless, have been effusively kind to me. They have entertained me and embroidered shirtwaists for me, they have adored me, in fine, until—oh! well, until a dozen of things. Until I was too busy to go to see them often, or until I innocently let fall my shadow across their love affairs, or—most often of all—until for no special reason their volatile affections flitted elsewhere. The educated women I have known, whether they liked me or not, have on the whole been *fair* to me. And, with all my acknowledged weakness for dainty raiment, I must deliberately say that I have found that a tribute more permanently satisfying than even the very sweetest things in hand embroidery. An innate tendency to be kind and generous is, like a comely person, a thing for which to offer becoming gratitude to one's Creator; it is not, so far as I can see, a thing over which greatly to plume oneself or a thing much to be counted upon by one's friends, unless it has been given steadiness and direction

by some process which can induce orderly thinking. True, the educational process does not always educate; neither does "joining the church" always make a Christian, but still the world looks for its best people in the church, and for the most part finds them there. So, from another point of view, it will find its best men and women generally in the ranks of the college-bred.

And I think that this is more conspicuously true of women than of men. The business training of most men gives them a something—if not an appreciation of the rights of the other fellow, at least a realization of what must of necessity be conceded to him—which serves as a sort of substitute for the logical faculty developed by schooling. The home life of women generally, and the more "protected" and conventional it is, the worse it is in this respect, is calculated in every way to make them unreasonable and selfish, and their state is the more hopeless by reason of their utter unconsciousness of it. The home-bred woman, for instance, if one of her maids falls ill, will probably carry her toast and tea, perhaps even apply a poultice; but she will never have given her the surroundings or the opportunities for rest which might have prevented the illness, because she has not touched even the border of that circle where people consider such things. And the same lack of that knowledge which leads to thought renders her equally ineffectual in all the relations of existence. The "goodness" of the nice girl, brought up in a comfortable home, with a little season of transplanting to the carefully chaperoned life of some irreproachable young ladies' finishing school, is not alone a thing too delicate for the storm and stress of temptation and disaster; it does not even show up very well in the long run of ordinary and uneventful domestic life.

The longer I live, the more I am convinced that a very large proportion of the words and acts which we deem reprehensible in both men and women are the result of nothing but lack of cultivated reasoning power. I am aware that almost everybody will be ready to meet this assertion with a list of historical personages, male and female, equally notorious for their cleverness and their unscrupulousness. But I would reply that as a matter of fact the list is not long, relatively, and that the comparative infrequency of such cases is precisely the thing which has given them undue importance in the minds of men. I think, too, that it might be found, and perhaps especially in the case of women, that the cleverness was a matter of unusual natural gifts misdirected rather than of education. At least I feel that it is demonstrable, if psychologists cared to undertake the task, that many even of the acts termed criminal, certainly the most of the meanness, the injustice, the cruelty and selfishness which deform society come from persons not vicious or depraved, but simply untaught to see either their own or others' actions in their logical relations and true proportions. The man who shoots his wife's lover for doing precisely what he would do himself did he feel inclined, is the victim far less of outraged affection than of a code of reasoning so absurd that it would be funny if it did not bring tragedy. (We do not seem to hear of many college professors doing it.) The notorious uncharitableness of women to their own sex belongs in the same category. It is not the "good" woman, but the "advanced" and educated one, who has dared to look at both sides of life, tho one be dirty, and to admit, not with slushy sentimentality but with cool-headed justice, that about the same clay formed her kind and the "fallen" one. This last is assuredly a matter of record, and no mere theory of mine. Every intelligent effort for social betterment in which women have taken part is due to women with a college training or its occasional equivalent. Even "mothers' clubs," if I am not mistaken, are due to the efforts of thoughtful women, generally not mothers, to infuse a little of that quality into the reproducing class.

It was not my purpose, however, to dwell on the work of the educated woman in college settlements, removal of police-court indecencies, and the like, since it is obvious as to be generally recognized, but rather to call attention to the college-bred woman's superiority in the supposedly smaller things of everyday life, in which according to popular estimate she "loses out."

When I see merely how much more agreeable college graduates, in the mass, are than any other one class of people, I marvel that so much is written and said in criticism of the development of the "merely intellectual" in mankind, as if it were a process calculated not only to dry up all the milk of human kindness but also to evaporate all the common sense from the subject who undergoes it. Of course, it is not hard to explain when it proceeds from a certain class of Sunday newspaper and magazine contributors; we are always ready to proclaim the worthlessness of what we do not possess. (I hasten to anticipate here the gleeful query of some critic as to whether this explains my low estimate of goodness. I do not desire the kind of "goodness" which I have in mind, and neither do you, esteemed reader.) But I do not understand why occupants of pulpits, mainly college men, and of other public platforms, proclaim the same idea so vigorously. The peculiarly unexplainable thing is that they seem not to recognize that college life does not develop the "merely" intellectual. Some college courses are better than others, certainly, and so are the professors who give them, but it is hard for a young man or woman to complete the work of an institution of respectable standing and not have gained a breadth of view and of human sympathy to be found in no other life offered to the young. And no more absurd untruth is given currency than that which represents the college professor, especially the woman professor, as a sort of bloodless, half human intellectual freak, whose influence upon young people, so far as it exists at all, is to draw them away from the simple and sane ideals of life to the abnormal and impracticable—to counteract, in short, the influence of home and mother. It does, it is true, counteract in a measure the influence of some homes and some mothers; the only pity is that because of limited time and opportunity that measure must be so small. Only within the last few days I have read in the "Foreword" to "Clara Wenckebach, Pioneer," these words:

> "A life which . . . represents a type of seemingly increasing prominence—that of the woman in whose mental make-up sex does not appear to be of prime and decisive importance . . . the woman whose instincts and interests are intellectual rather than domestic; one who marries if *the* man comes her way, but otherwise 'hunts' congenial activity in preference to man or motherhood."

The passage would seem to me, even if I had not known the woman who inspired it, a peculiarly well-expressed definition of the woman professor, and professional woman generally, as she actually exists. And to every woman who as a young girl knew Fräulein Wenckebach or that other woman with whose name Wellesley College is inseperably linked, it seems to me that there can be no question that they represented the very best type of womanhood that can possibly be. That no one who did so know them can express an opinion of their intellectual qualities which does not also glow with love for their personality, perhaps is the best tribute that can be paid them. Yet neither was a mother, and the one who married continued her public activities so successfully that I suppose it must surprise most people to read that she reveled in her home life, and was enthusiastic over the paring of peaches and making of jellies. These women both were conspicuous proofs of the truth which seems to have escaped an astonishingly large number of reasoners upon the woman question—that no amount of studious delving, of public administrative duty, ever destroys the taste for pleasant domestic surroundings, the love for little children, the fidelity to friends, in women at all endowed originally with these lovable qualities, but that the exclusively jelly-making tribe, while displaying the "womanly" graces no whit more attractively, have found no avenues of possible mental activity or practical utility beyond the consideration of the relative merits of apple and quince. That is a very good thing to know, but it must be conceded that as a continual subject of meditation and discussion it—palls. This illustration I use by way of preparation for the utterance of a very shocking sentiment, but none the less profoundly true, in my opinion. It is this: that on a larger scale it is just as absurd to say that the highest vocation of woman is to be a good mother and homekeeper as it is to say that the noblest thing in homekeeping is to make

good orange marmalade. Such confections no one appreciates more than I, but ability to create them is a small part of the equipment of a good housekeeper. So is performing the maternal and wifely functions an exceedingly small fraction of the life of a truly good woman. I have taken pains not to say in the foregoing sentence, "being a good mother." For there is this difference between maternity and jelly-making; you may make admirable jellies and know pretty nearly nothing else in the world, but not so can you make a good mother. Possibly my experience has been unfortunate, but I never yet met any female creature who rolled up her eyes and gushed that she believed her duty as a mother to be higher and more sacred than anything else in the world, who *was* a good mother, or a good anything—even dresser. For such women generally make this an excuse, along with other of their sins of omission. for being both down at the heel and sloppy at the waist-line.

Had Clara Wenckebach and Alice Freeman Palmer elected to be mothers, they would have been as much better mothers than those who boast of being *only* that as their intellectual outlook was broader, their wise sympathy deeper. It is given only to the few, certainly, to possess such a combination of rare intellectuality and personal magnetism as these two women had. But no woman lives who cannot make more of such graces as are hers by the cultivation *and active definite use* of such intellect as is also hers. In the late discussion as to "Why Educated Women Do Not Marry" I have been surprised—and somewhat pained—to see the general tendency among its educated discussers to accept the popular theory of the *profanum*—not to say *malignum*—*volgus* that the educated woman is less attractive to men than the pretty fool. (Why always "*pretty* fool"? As many of them are homely as of doctors of philosophy.) For my own observation—but for my unbounded respect for the demands of public opinion as to the humility to be observed by the unwedded in speaking on this topic I might add experience—has been to the contrary. If I may express a belated opinion, I should say that that peculiar quality which inspires love in the opposite sex is not, in either men or women, a question of education or the lack of it. I do not know what it is, but we all recognize its existence. Some women will always have lovers, and some will always be made confidantes of hearts distraught by the wiles of Polly Jones. And both may be college professors or both maidens innocent of scholastic lore and dedicated to bridge and fancy-work; their destinies so far as man is concerned will be about the same. I cannot but add, however, that I think about as efficacious a matrimonal anti-toxin as a woman can employ is to be eager to marry. And, further, I should suppose that any man of intelligence would be as little attracted as I am by the woman who, having tasted the delights of study and engaged successfully in any professional work, cries out that nothing in all this can give her any satisfaction, but only a husband and a house to keep for him. Such occasional college graduates do stand as stubborn testimony to some yet uncorrected defect in our system of feminine education. I can hardly believe that that defect is explained by the late brilliant discovery that "the women's colleges are merely imitating the education of men." I should say that the trouble is that they have not yet thorolly inculcated the idea that, tho there are properly certain lines for sex, as for individual, specialization, in the essentials of mental training there is no education for men and education for women, but only for human beings. And when there is so much in life for women as well as men besides marrying and giving in marriage, surely we do but ill to depreciate for the former that which opens for them the door to it all, and which for matrimony assuredly raises the quality if not the quantity.

And so, if it seem too startling to reverse our motto to read, "Be clever, sweet maid, and let who will be good," at least I venture to paraphrase another from a more inspired source: "Seek first the kingdom of intellect, and all these things shall be added unto you." For I have seen it proved.

Courage in Dress

BY JAMES C. BAYLES

PROF. JOHN M. TYLER, of Amherst, lately startled the members of the American Psychical Education Association—if those devoted to the study of occult phenomena are capable of being startled,—by stating that women are and have always been stronger than men. Whether there is a biological, physiological or psychical basis for this assertion we are not prepared to say on the evidence thus far presented. That it contradicts what have been accepted as the analogies of nature is undoubtedly true. The fact remains, however, that whether women are stronger or weaker than men they have the courage to do a good many things which men are afraid to attempt. This is strikingly exemplified in the way in which thousands of women have espoused the issue of female suffrage, and the readiness with which they invite a modified form of martyrdom by defying law and order and making themselves at once odious and ridiculous for no better reason than to focus public attention upon a demand which they see no other way to emphasize than by vagaries. It would certainly be difficult to find an equal number of men who would be half as brave in like circumstances. They might risk death without hesitation to support a conviction, but in a case where violence could accomplish nothing and persistence might, they would lack the courage to begin and the fortitude to persist, especially if laughed at.

An illustration of this is found in the readiness with which women in civilized communities conquer popular disapproval of changes in styles of dress by open defiance of public opinion until it accepts what they wish it to accept. Just now we are witnessing the preliminary skirmishes of what looks very much like a revolution in female dress. What is known as the harem skirt in various bifurcated modifications is now under consideration. If it commends itself to the average woman as for any reason a desirable innovation, its adoption is inevitable. Newspaper ridicule, masculine disapproval, adverse legislation, and even ecclesiastical prohibition, from mild and tearful pastoral admonition to the major excommunication, would only hasten its adoption. When the women, for reasons of their own, are ready for a dress revolution, it will come as certainly as harvest follows seed-time, and they will be indebted to no one but themselves for bringing it about.

With men such a revolution, while possible, would assume the character of an evolution after nature's method in the differentiation of species. Much as a man may desire an immediate and radical change in his customary attire, he lacks the courage to initiate it or even to follow a movement in that direction unless at a safe distance. For example, he knows from experience that long trousers are uncomfortable, expensive, difficult to maintain in shape and, in stormy weather, as impractical as could be devised. He longs for the freedom of knee breeches which his forefathers knew and realizes that he has been subject all his life to the tyranny of the tailor who has every reason for keeping long trousers the fashion. Many weak and futile attempts have been made to popularize knee breeches, but they failed because the men who approved them were afraid to wear them except on the golf links.

We are now within a few weeks, at most, of more than tropical heat, but the question of suitable dress for men when high temperatures are intensified by high humidity is as far from a sane solution as at any time within a century. Before long the average man will awake to a realizing sense of the fact that however ample his wardrobe he has nothing to wear which in any respect is suited to his meteorologic environment. The most he can do, and about all that is possible to be done beyond donning lighter underwear, is to leave off his waistcoat, which is permissible when his linen is immaculate, provided he conceals his suspender buttons. Between the summer suit and the suit made for another season the difference is chiefly one of color. To be "well dressed" in midsummer he

must be uncomfortable. He knows this very well, but he lacks the courage of his convictions and deliberately sacrifices comfort on the altar of his moral invertebration.

That nearly every detail of the conventional masculine attire is as unsuited to our normal summer temperatures as ingenuity could devise, will be admitted without discussion. The average man appreciates the comfort of laying off his coat, waistcoat and collar when warm, but feels it incumbent upon him to resume these superfluous impedimenta when he emerges from privacy or when it is intruded upon by visitors, especially women. These same women may be clothed in all modesty in linen skirts and diaphanous shirt waists. As a matter of fact the man would be as appropriately and suitably dressed in well-laundered pajamas. Apparently, it should require no great effort to popularize the two-piece suit of light flannel or soft linen, and what such an innovation would mean to mankind in the north temperate zone could scarcely be exaggerated. The two-piece suit would consist of shirt and trousers, united by a belt or sash as fancy might dictate. It could be perfect in cut and fit, faultless in creasing, agreeable in color and so obviously comfortable as to command the approval of the most fastidious. Incidentally, it would have the advantage of being strictly practical, and when a drop in the temperature demanded it might be worn with a coat. Whether light or heavy undergarments, or none at all, were worn with such a suit, would depend upon the condition of the sensory nerves of the wearer. The only reason the average man does not provide such an outfit in anticipation of what he knows is imminent, is that in such matters he is pigeon-livered and lacks gall. His mother, his wife or his sister should take him in hand and inspire him with the courage to be comfortable.

New York City.

To Dandelions

BY EVALEEN STEIN

Crocus, peachbloom, violet,
Daffodils with dewdrops wet,
Lovely all, and lovely, too,
Dandelion flower, are you!
Minting all the mellow mold
Into starry yellow gold,
April's darling prodigal,
Happy spendthrift, friend of all,
Lavish largess flinging free
In your gay camaraderie,
Flower of joy, the robins sing
Blither for your blossoming,
And the bee and butterfly,
Seeking you, forsake the sky!

Sunny-hearted, even so,
Childhood's merry playfellow,
Decking little ones with rare
Sea-green curls as mermaids wear,
Filling chubby palms that press,
Holding you in close caress,
Offering to autumnal age
Springtime's happy heritage,
Making all the pathways bright
For the wayfarer's delight,
Ah, let no one grudge the room
For your twinkling yellow bloom!
Surely should such beauty be
Hailed and cherished gratefully!

And that Field of Cloth of Gold
Trodden by those kings of old,
Did it show such rich array
As our own home fields today?
Nay, I think not any gem
In most royal diadem,
None can boast a truer worth
Than this living gold of earth,
Making with its glittering
Every passer-by a king.
Crocus, peachbloom, violet,
Daffodils with dewdrops wet,
Lovely all, and lovely, too,
Dandelion flower, are you!

Our Savings Bank Deposits

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

SINCE savings bank deposits represent to a considerable degree the accumulations of wage-earners, the statistics of these savings should attract public interest. In 1910 there were 9,142,908 depositors in the 1,759 savings banks of this country, with a total of $4,070,000,000 to their credit. How rapid has been the increase in the number of depositors is made apparent when we consider that in 1820 they were less than 9,000, in 1850 only about 250,000, that in 1866 the number for the first time passed the 1,000,000 mark, and in 1891 the number was about 4,500,000, or half as many as at present.

The deposits in these savings banks exceeded $1,000,000,000 for the first time in 1883, and passed the $2,000,000,000 mark in 1898. To the $4,000,000,000 of deposits in the savings banks there should be added a total of $576,000,000 in savings bank deposits in nearly 3,000 national banks, so that the total savings subject to the call of depositors is now nearly $5,000,000,000. If all of these savings bank depositors should withdrew their savings on the same day there would not be enough money in the United States to pay them if all of our gold, silver, paper money and fractional coin should be given to them.

Not only has the total number of depositors and the amount deposited increased with remarkable rapidity, but the average per depositor has increased nearly four-fold in a little less than a century, growing from $131.86 in 1820 to $445.20 in 1910. The average to each depositor in the New England States is $396, in the Eastern States $488.96, in the Southern States $250.15, in the Middle Western States $366.41, in the Western States $206.08, and in the Pacific States $733.46. The largest average reported by the Comptroller of the Currency, in 1910, was $971.45 in Oregon, and the smallest $58.64, in Alabama.

Literature

A Womanly Advocate of Woman's Cause

In the pathetic introduction to Olive Schreiner's new book, *Woman and Labor,** pathetic in its self-restraint and passionless statement of the hard conditions under which it was written during the Boer War and her own imprisonment, she tells of a larger work of which the present formed only one chapter out of twelve. It is the world's loss that her great work, "Musings on Woman and Labor," was wantonly destroyed in the looting of Johannesburg by the British troops; we could spare many world-famous art treasures more easily than this, which had occupied many years of Mrs. Schreiner's life in writing, and which she is unable to reproduce because of ill health. The allegory, "Three Dreams in a Desert," published nineteen years ago in her lyrical book entitled "Dreams," was taken from the lost manuscript, a fact which intensifies our regret for its destruction.

The greater part of the present book, *Woman and Labor,* is concerned with "Parasitism" as it faces the race today, and threatens all civilized nations with deterioration and decay. There is no trace of bitterness toward men, nor of distrust of women, cognate faults of the opposing factions on the woman question. The argument is sane, dignified, able and eloquent. Mrs. Schreiner recognizes the great, impersonal social forces and changes which have brought about evil conditions in the life of modern women; that their unemployment is only a part, but a very dangerous part, of the unemployment of a large number of the race; the result of the production of machines to lessen the number of workers required; that every such great change renders a readjustment imperative; that the unrest among women at the present day is not a symptom of deterioration, but a sign of vital power, of unspent energies seeking an outlet in labor, without which any race or portion of a race will disintegrate and degenerate; that the mothers of men must be given the right to labor freely in any field or the whole future of the race will be in peril; that this demand for opportunity is not morbid but healthful.

". . . The fact, which I have come to regard as almost axiomatic, that the women of no race or class will ever rise in revolt or attempt to bring about a revolutionary readjustment of their relation to their society, however intense their suffering and however clear their perception of it, while the welfare and persistence of their society requires their submission: that wherever there is a general attempt on the part of the women of any society to readjust their position in it, a close analysis will always show that the changed or changing conditions of that society have made woman's acquiescence no longer necessary or desirable."

The chapter upon "Women and War" glows with a white heat of indignation at the cruel waste of life in war, life which has cost the mother so much flung away heedless of the pain and toil that produce it; we can picture the whole chapter written under the cruel conditions of the Boer War, with her own heart broken at the needless sacrifice about her. "We pay the first cost on all human life," she cries, ". . . whenever war occurs, if the state is to survive, there must be an increased child bearing and rearing. This throws upon woman a war tax, compared with which all that the male expends in military preparation is comparatively light." But there is no antagonism toward man; the author reiterates that the tendency of the woman's movement is toward a closer and finer union of the two; that it will result in a purer and more sympathetic relation toward each other.

"Always in our dreams we hear the turn of the key that shall close the door of the last brothel; the clink of the last coin that pays for the body and soul of a woman; the falling of the last wall that encloses artificially the activity of woman and divides her from man; always we picture the love of the sexes as once a dull, slow, creeping worm; then a tor-

*Woman and Labor. *By Olive Schreiner.* New York: Frederick A. Stokes Company. $1.25

pid earthly chrysalis; at last the full-winged insect, glorious in the sunshine of the future."

For Olive Schreiner sees that the full freedom of woman does not lead to immorality, but to a sterner sense of duty and obligation; to a higher ideal of sex relations. Nothing is more attractive in this summary of the new social ethics than the breadth of view, the clarity and charity of the discussion. Mrs. Schreiner is a woman of rare power. In genius she stands in the front rank of her sex. In ripe wisdom, sanity and fairness we recall no recent book that equals *Woman and Labor*. The spirit of self-sacrifice and devotion which inspires the leaders in the movement for the equality of the sexes is finely interpreted by her in the following words:

"I should like to say to the men and women of the generations which will come after us—You will look back at us with astonishment! You will wonder at passionate struggles that accomplished so little; at the, to you, obvious paths to attain our ends which we did not take; at the intolerable evils before which it will seem to you we sat down passive; at the great truths staring us in the face, which we failed to see; at the truths we grasped at, but could never get our fingers quite round. You will marvel at the labor that ended in so little; but, what you will never know is how it was thinking of you and for you, that we struggled as we did and accomplished the little which we have done; that it was in the thought of your larger realization and fuller life that we found consolation for the futilities of our own."

OLIVE SCHREINER,
Author of "Woman and Labor." (Stokes.)

....One of the travel-books on Stokes's spring list is Miss Betham-Edwards's *Unfrequented France*, and among the art books announced by the same publishers are studies of Constable, Romney, Masaccio, Vermeer and Metsu, in "The Painter's Series," of Corot and Delacroix in the "Masterpieces in Color," and *Three French Painters of the Eighteenth Century*—Le Brun, Chardin and Fragonard—in the "Great Masters Series."

George Meredith

VOLUMES XIX to XXII in the handsome "Memorial Edition"* of George Meredith's writings, containing respectively Vol. XIX *The Amazing Marriage*, Vol. XX *Celt and Saxon*, Vol. XXI *Farina, The Case of General Ople and Lady Camper*, and *The Tale of Chloe;* Vol. XXII *The House on the Beach, The Gentleman of Fifty and the Damsel of Nineteen*, and *The Sentimentalists*, an unfinished comedy, complete the noble body of fiction produced by the master-novelist of his time. This great group of novels and tales, constituting both a wonderful gallery of more than 1,200 portraits and sketches of imaginary men and women and an invaluable commentary on human character and conduct, is so diversified, both in content and in style, as to be fairly bewildering to the beginner; and, as often happens to an author of such brilliant versatility, Meredith suffers misappreciation and even misunderstanding in the minds of many readers because they have begun to read him at the wrong end. The reader who does not yet know the work of this original and daring creator of the philosophic novel can hardly do better than to begin with either *The Adventures of Harry Richmond* or that most entertaining of all the novels, *Evan Harrington*, and follow these with *Diana of the Crossways*. Next take up *The Ordeal of Richard Feverel*, that poignant tragedy of first love which in its glowing fusion of intellect and feeling is considered by many to be the greatest of all of

*MEMORIAL EDITION OF THE WORKS OF GEORGE MEREDITH. Vols. XIX to XXVI. New York: Charles Scribner's Sons. $2 each.

Meredith's novels. Then would come as good a time as any to read the shorter stories: *Farina*, a tale of romantic adventure in a medieval setting; those captivating ebullitions of the comic spirit *The House on the Beach* and *The Case of General Ople*, and the profoundly tragic *Tale of Chloe*. One should now be ready for *Sandra Belloni* and its sequel *Vittoria*. These might be followed by *Rhoda Fleming* and that in turn by *Beauchamp's Career*. The rest of the novels might as well be enjoyed in their chronological order: *The Egoist, The Tragic Comedians, One of Our Conquerors, Lord Ormont and His Aminta, The Amazing Marriage, Celt and Saxon*. Anyone who has come thus far will not be satisfied until he has read also *The Shaving of Shagpat*, the first of Meredith's prose writings, and for those who are not willing to take it as simply the thousand-and-second entertainment of Scheherazade, one of the hardest to read.

Volume XXIII of this edition contains the *Essay on Comedy* and other critical pieces. The last three volumes received are given to the *Poems*. And an impressive showing it makes now that the whole of Meredith's work in verse has been gathered together, for the first time. He was a poet before he began to write novels; he continued to write poems after he had ceased from fiction, and no other English novelist ever produced so much verse of such a high order of merit. To a certain extent, thruout his career, the poems paralleled the novels and they show a similar progression from the simplicity of youth to great complexity of thought rigidly compressed in its expression. The student of Meredith's poetry should begin with "Love in the Valley," some of the tuneful, lilting, simple songs of his first volume (suppressed thruout the author's lifetime, and now first brought together with all his later verse to make the collection complete), and the dramatic lyrics: "Martin's Puzzle," "The Old Chartist" and "Juggling Jerry"—three little masterpieces of genre painting in which Meredith has dealt with the humblest rural life as feelingly as any English poet. When one has listened to the music of "The Lark Ascending," "Melampus," "Seed-Time," "The Thrush in February," and the masterly "Hymn to Color"; has enjoyed the incisive thrust of the sonnets, and has appreciated the "passionate and various beauty" of "Modern Love" which Swinburne long ago pointed out when acclaiming it "in some points a poem above the aim and beyond the reach of any but its author," he will be ready to delve for himself in the rich mine of Meredith's later ethical work in verse.

❧

Old Country Inns of England. By Henry P. Maskell and Edward W. Gregory. Boston: L. C. Page & Co. $3.

"We can safely assert that no English inn has a history of more than 800 years. . . . Very few hostelries can trace their independent existence to a period earlier than the fourteenth century."

In spite of their shockingly brief record, English inns have for the American tourist an interest almost if not quite as lively as English churches and manor houses and colleges. True it is that they are decadent in more senses than one, and that scores of old gentlemen have written letters to the editor of the *Spectator* demanding, What does it mean? True it is that the cookery of English inns is nothing for an Englishman to be proud of, and that even the ale-room is not what it once was. Yet the English inn is perhaps all the more natural a subject for the historian because it is decidedly on the wane; and the present writers have prepared a volume that is, with the drawings for which they are responsible, decidedly attractive. The light it reflects, directly or indirectly, upon various English institutions, is indeed considerable. From the chapter on The Inns of Literature and Art we miss Crabbe's name and verses. And where is Tennyson's immortal tribute to the "plump head-waiter at the Cock"? It seems to us unfortunate that there is no bibliography—for the authors must have found exceedingly useful a number of volumes to which it would have been just for them to refer, and a convenience for their more curious readers. But some of the chapters are in no sense merely summarized out of earlier authorities; thus the final chapter is on Public House Reform. It is not, however, a statistical chapter; and the whole volume is of a pleasant amateurish flavor.

East and West. Comparative Studies of Nature in Eastern and Western States. By Stanton Davis Kirkham. New York: G. P. Putnam's Sons. $1.75.

Mr. Kirkham seeks for Nature where Nature lives, not in museums and libraries. His science is applied science. Botany and zoölogy as he uses them enhance esthetic enjoyment instead of killing it. We do not find here the fantastic psychological interpretation or misinterpretation of animal life, now so common. The author describes what he sees—and he sees a great deal. Descriptions of scenery in current novels are generally and justifiably skipped by the ordinary reader, for they are usually put in as breaks, merely to check the course of a narrative likely to exceed the speed limit. But in this volume, where there is no plot worrying us and no denouement hurrying us, we can enjoy this fine descriptive writing for itself as we enjoy the views from a car window when we are not impatient for our destination. We are glad to see that Mr. Kirkham appreciates the picturesqueness of the arid region. The chapters devoted to Arizona are, in our opinion, the most interesting, as they are undeniably the most novel, part of the book.

"IN THE DEPTHS WHERE THRUSHES FLIT, A REGION OF TWILIGHT AND SHADOWS."
From Kirkham's "East and West." (Putnam.)

Conrad in Quest of His Youth. By Leonard Merrick. New York: Mitchell Kennerley. $1.20.

If there is any one thing rather more depressing than any one other thing, it is the return of middle age to the pleasures of fond recollection. And if any one thing can make this kind of sentimental journey more than commonly depressing, it is to find at its end some of memory's children. The "old boy" who revisits school almost always wishes that he hadn't. In most cases meeting other "old boys" makes the case even more lamentable. Yet it is a somewhat quixotic quest of youthful scenes and friends, in the hope of reviving youthful zest and enthusiasm, that the hero of Leonard Merrick's latest novel makes after he has

inherited money enough to give up his position in the colonies. First of all he goes to Paris, but it is not the old Paris. Then he hunts up his playfellows and brings them together at a seaside place in England where they had been happy a generation before; but even that does not pay him in happiness. Next he makes love to the woman to whom, twenty years before, as a boy of seventeen, he had not dared to make love; and this time it is even worse, for he falls asleep while waiting for her to meet an appointment. It is only when Conrad starts living in the present and abandons all effort to reconstitute his past that he catches a glimpse of happiness and realizes that he is not really aged, after all.

ONE OF THE WINSLOW HOMER PAINTINGS AT THE METROPOLITAN MUSEUM.
Reproduced from the American edition of "Schools of Painting."

This is not the best of Leonard Merrick's tales, but it is not less clever than most of its predecessors. Why the author has never had a larger public in America is one of the several mysteries which we have not solved. Certainly in technique and in all the little tricks of story telling this whimsical, shrewdly humorous and pleasantly sentimental novelist stands almost alone.

Schools of Painting. By Mary Innes. Edited, with a chapter on Schools of Painting in America, and certain further additional material, by Charles de Kay. 106 illustrations. New York: G. P. Putnam's Sons. $2.50.

The style of this English history of painting is undistinguished, but it answers the requirements. The same adjectives will serve for the criticisms proffered along with dates and historical notes. But one prefers, nine times out of ten, that the point of view at least should be conventional, where so many and so various materials must be manipulated in so few pages. *Schools of Painting* will, doubtless, prove a useful reference work: we at least mean to put it to the test. Yet the most hasty perusal betrays wide gaps. Thus a work that has chapters on Spanish art wherein names like Sorolla and Zuloaga do not occur, and where Goya's appears only casually, in one of the American editor's essays providing "certain further additional materials," is obviously neither successfully encyclopedic nor altogether up to date. The American editor is both of these things, however, in the chapter which he tacks on to the end of the book, the subject being our more or less native painting. Most of the Independents, who exhibited last month in New York City, will find themselves given a line, and several of them are vouchsafed adjectives, altho these they must generally share with two or three competitors. Since this is not a mere dictionary of art, we wish that Mr. De Kay might have hurt some one's feelings by leaving him out altogether, while telling his readers something worth while about a chosen few. We regret the plan, or absence of plan, in this chapter all the more keenly

because Mr. De Kay says what he does permit himself to say rather well, with perfect sincerity, and with pretty close adherence to our own private standpoint. The volume is handsomely illustrated. How many readers are going to observe that of the reproductions from photographs of American canvases every one, with never an exception, is out of the Metropolitan Museum?

Great Britain and the Illinois Country, 1763-1774. By Clarence Edwin Carter. (Prize Essays of the American Historical Association, 1908.) Washington: American Historical Association. $1.50.

From the character of the volumes crowned by the American Historical Association, it is possible to learn much of the present status of historical scholarship in the United States. These volumes are submitted year after year in competition for the prizes bearing the honored names of Justin Winsor and Herbert Baxter Adams, the former of which was awarded to the writer of this book. Neither of the names is without significance, since both Winsor and Adams exemplified the abstruse and critical scholar rather than the literary historian. It has been found practicable to encourage and teach an admirable technique for historical workers. Literary craftsmanship is as yet unteachable, and comes of itself or not at all. Professor Carter's essay treats of the history of the Illinois region in the years intervening between the proclamation of 1763 and the outbreak of the American Revolution. It has all the earmarks of the historical laboratory in its copious notes and references, which not only elucidate the text, but reveal the extent of the author's work among the sources. The text is straightforward and not uninteresting. But by far the most enlivening portion of the book is the bibliography, in which critical notes are attached to the titles of most of the existing works relating to this phase of the history of the West. The criticism is often piquant and commonly adverse, and leads up to an expression of belief in the "uncritical and unreliable character of most of the writings on Western and Illinois history," in which we heartily concur.

Literary Notes

....An edition of Sebastian Hensel's *The Mendelssohn Family* in a single volume ($3) is issued by Harpers. An authoritative work is thus placed within the reach of a still greater public than has already known it.

....In a note recently published we praised the story of a ram, *Silverwool*, by Miss Emily Jenkinson (Baker & Taylor Company; $1.50)—spelling the title, however, "Silverwold," for some reason best concealed. It is a pleasure to make the correction.

....Among the works of merit which the Tercentenary Celebration of the publication of the authorized version of the Bible has called forth we must reckon the story of the work of translation told by William Muir, M. A., in *Our Grand Old Bible* (Revell; $1.25). The account begins with the early English translations of the Psalter and is carried down the centuries to the American Revision of 1901. The book is popular and reliable.

....Twenty-five years ago the author of this note made use of the *Satchel Guide to Europe* and if he were called upon to start tomorrow for a brief trip abroad he would take with him the 1911 edition just received from Houghton Mifflin Co., for there is no other volume of its size and price ($1.50) with so much in it. We are glad to see that the *Satchel Guide* is to be kept up in spite of the death of its author, Dr. W. J. Rolfe, the great Shakespearian scholar.

....The debt of some few writers who use French as the vehicle of their ideas to Ralph Waldo Emerson is considerable—that of Maeterlinck, for example. Yet it is only within a few years that Emerson has been translated into French, and only a small portion of his work is even now acessible in that language. Mademoiselle Dugard, the author of a monograph on the Concord Sage, has recently added a volume of essays to her earlier volumes of translation, entitling it *Société et Solitude* (Paris: Armand Colin; 3 fr. 50).

....Grace James in *Green Willow and Other Japanese Fairy Tales* retells two score stories of the Japanese folklore (Macmillan; $5). Most of the tales are familiar to those who have read Mitford and later popularizers in this field, Lafcadio Hearn being one of Miss James's distinguished predecessors. The present writer's style is of no such finish and beauty as Hearn's, but has lightness of touch. This latest adapter has preferred in the main the stories which have other appeals than horror or tragedy. The numerous illustrations are in a pseudo-Japanese style by Warwick Goble.

....In *A Youthful Man o' Warsman* Edgar Stanton Maclay tells "a true story of the navy" (Greenlawn, N. Y.: Navy Blue Co.). He draws for the best of his material upon the diary of Samuel Leech, who served thruout the War of 1812 and knew its hardships as well as its excitements. Leech entered the war as a British a. b. but, after being taken prisoner by the Americans, entered the United States navy, was captured again, this time by the English, re-entered the American navy on his release, and became in due time a citizen of these States. His story is a thrilling one, and is well told by an authority in naval history.

....In 1909, a first prize of $300, offered by Hart, Schaffner & Marx, of Chicago, to college students for essays on economic topics, was awarded to Gilbert Lewis Campbell, then an undergraduate in Northwestern University, whose subject was *Industrial Accidents and Their Compensation.* The judges were Professors J. Laurence Laughlin, J. B. Clark, Henry C. Adams and Edwin F. Gay, and Mr. Horace White. Mr. Campbell has since revised and enlarged the essay, which is now published in a volume of 105 pages. Beginning with the statistics of industrial accidents here and abroad, the author shows the social cost of them and then considers methods of industrial insurance and the laws of the States concerning employers' liability, closing with suggestions for remedies to be provided by further legislation. The little book has been written carefully, and it appears at a time when the questions which it considers are prominent in American Legislatures. (Houghton Mifflin; $1.)

....The first issue of a new quarterly review of dramatic literature comes to us from Chicago (*The Drama;* The Dramatic Publishing Co., Pontiac Building; 75 cents; $3 a year). The editors are Professor William Norman Guthrie, of the University of the South, and Charles Hubbard Sergel. In the February, 1911, issue appear a comedy in four acts by Giuseppe Giacosa ("As the Leaves"), and critical articles by Percy MacKaye, Nathaniel Wright Stephenson, and others. G. C. Ashton Jonson, in telling of a London *Théâtre Libre,* recalls the first presentations of Maeterlinck in England—in 1895. In England, but in French, these performances.

"Maeterlinck himself came over and added a touch of originality to the reception that we had arranged for him, by wiring during the morning 'Mère oppose depart.' As it was frightfully rough in the channel and the dear French actors and actresses arrived looking like thirty cents, we naturally concluded the first word should have been 'Mer' and that this was the Belgium Shakespeare's (as he was then slightingly called) method of announcing that it was too rough to cross. But no! it was filial devotion, just French filial devotion, than which there is nothing more touching, but fortunately our lion arrived in time and we proceeded with joy to our financial Thermopylæ."

Pebbles

"Pa, what is superstition?"

"Any kind of a belief that another will not give up when you tell him your belief is different."—*Judge.*

Londoner (to Pat, seeing a Rugby game for the first time)—What do you think of it, Pat?

Pat—Begorra, it 'ud be a jewel of a game if they only had shticks!—*Punch.*

Looking at Lorimer from all angles, one is forced to the opinion that the donors of that $100,000 slush fund didn't get their money's worth.—*Cleveland Leader.*

"You can't see the leading lady now; she is busy in the dressing room."

"Is she changing her costume for the next act?"

"No; this is an Ibsen play. She is merely making up her mind."—*Cornell Widow.*

What is the matter with magazine verse, do you ask? Sometimes it is the point of view. The editor of one monthly magazine says that he recently received this letter:

"How much do you pay for poetry and what kind do you want? I will write it to order for you and I can handle any topic."

NEVADA.

Nevada, 'tis of thee,
Sweet State of Liberty,
Of thee I sing.
State where our fathers flee;
State that sets mothers free—
Marriage, because of thee,
Hath lost its sting.
—*Chicago Record-Herald.*

He had been calling on her twice a week for six months, but had not proposed. He was a wise young man and therefore didn't think it necessary.

"Ethel," he said, as they were taking a moonlight stroll one evening, "I-er-am going to ask you an important question."

"Oh, George," she exclaimed, "this is so sudden! Why I"—

"What I want to ask is this," he interrupted. "What date have you and your mother decided upon for our wedding!"—*Chicago News.*

A Southern lawyer tells of a case that came to him at the outset of his career, wherein his principal witness was a darky named Jackson, supposed to have knowledge of certain transactions not at all to the credit of his employer, the defendant.

"Now, Jackson," said the lawyer, "I want you to understand the importance of telling the truth when you are put on the stand. You know what will happen, don't you, if you don't tell the truth?"

"Yassir," was Jackson's reply; "in dat case I expects our side will win de case."—*Harper's.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

The Agreement with Canada

OPPONENTS of the reciprocity agreement have relied, in this country, mainly upon the assertion that justice calls for amendments in the interest of our farmers, and, in Canada, upon the cry that the agreement was designed by the United States to promote annexation. Much of President Taft's admirable defense of the agreement, in New York last week, related to this argument about amendments, the effect of the addition of amendments in the Senate, and the cry of annexation. We are glad that he made that speech. Full reports of it have been, or will be, read thruout this country and Canada, and in England—here, by farmers who have been misled by their Senators and others; in Canada and in Great Britain by those who have been induced to believe that our Government's hidden purpose was to obtain political control of the Dominion.

"The talk of annexation," said Mr. Taft, "is bosh." That is true, but the talk has had effect in Canada. Because it excited opposition there to the agreement, attempts have been made to intensify this opposition in dishonest ways. For example, a pamphlet has been circulated widely containing what was alleged to be an exact report of a speech "recently delivered in Missouri" by Speaker Champ Clark. A part of it was as follows:

"Fellow Missourians, our party sees in the Reciprocity bill a wedge which will be driven between eastern and western Canada. A country divided against itself must fall, and the wedge we shall drive by means of this bill will split Canada in two, and both halves will fall into the lap of the United States. In other words, gentlemen, the Democratic party means to annex Canada by force or guile. Why? Because, gentlemen, Canada is under the tyrannous heel of a foreign country, a country that is a monarchy and, therefore, absolutely opposed to all the tenets of democracy. The Democratic party have come to the conclusion that Great Britain by its monarchical system, which is extended over Canada, directly transgresses the fundamental idea of the Monroe Doctrine, and we are therefore acting well within our rights; we are going to annex Canada."

Some one sent the pamphlet to Speaker Clark, who replied that it was a forgery, that he had never at any time or place uttered a single sentence of the "speech." But this trick was not exposed until a few days ago, and even now there must be many Canadians who believe that the speech was actually delivered.

On our side of the line farmers have been assured that many amendments, putting meats, flour, etc., on the free list, ought to be added, in justice to them. Mr. Taft shows that such provisions were rejected by Canada because, so to speak, the shoe was on the other foot. Canadians were convinced that American producers of the commodities in question could undersell them in the Canadian market. Therefore, the suggested amendments would not help the American farmer by reducing the cost of living for him. But these are the amendments by which the agreement is menaced today in the Senate.

They should not be offered, and they should be opposed, for two reasons: first, because, if adopted and made effective, they would be of no value to our agriculturists or other consumers; second, because, if affixt to the agreement they would invite successful demand from several foreign countries for similar concessions, under the "most-favored nation" clause of existing treaties. It

may fairly be said that they would kill the agreement. "The use of amendments," Mr. Taft remarked last week, "is a very common method of defeating legislation when the responsibility for its defeat is one that the movers of such amendments do not desire openly to assume."

There will be a long contest in the Senate, and the result of it cannot now be foreseen. Some predict that the bill cannot be passed there unless the amendments proposed by certain Republican insurgents are attached to it. To pass it in that way would be actually to defeat it. If Republican Senators are determined thus to wreck a memorable agreement negotiated by a Republican President, they should know that they are on the point of making a great political blunder.

The Los Angeles Crime

We would anticipate nothing, for trial before the court must settle it, whether, as charged, it was the concerted crime of the high officials of a national labor union of high degree, the Bridge and Structural Iron Workers' Union, which blew up with dynamite the Los Angeles *Times* and killed twenty-one men; or whether this is a damnable plot contrived by the tools of an organization of builders and capitalists to discredit and destroy an innocent labor union and so put the workmen in their power. Whichever is true, the criminality is too great for words to express.

Yet some things are clear and must be said. A union is good so long as its purpose is to maintain the rights and subserve simply the interests of its members. A union will be bad if it helps itself, or hopes to help its members, by violence and murder. This is a very commonplace statement, and yet worth the saying. No representative of labor would dare openly defend violence. Labor leaders always deny that in the case of strikes they employ violence; that, they say, is resorted to by boys and sympathetic, but irresponsible, bystanders. At the same time there is a general suspicion that violence when committed finds sympathy, and it is often privately defended. We are familiar with such violence, especially in street railway riots, where the mob is sure to sympathize with the strikers and show it by the destruction of property.

The Los Angeles tragedy was of a different sort. There was no mob; it occurred at night. It was the result of the refusal of employers to yield to the demands of the employees. While we must presume, legally, any accused man to be innocent until proved guilty—and we shall hold to this rule in the cases of J. J. McNamara, secretary of the Iron Workers' Union, and his brother—yet no one can help knowing that it was the labor union men who felt aggrieved that non-union men were employed, and it is they who stood in to gain profit, or at least revenge, by this dynamite explosion which wrecked the building and killed its occupants. Accordingly, it is the natural suspicion that some member or representative of the union exploded the dynamite or at least planned the outrage of which others were the guilty doers. We do not mean that the McNamara brothers are guilty, at least not yet, for they are still to be presumed, legally presumed, innocent. But if not they, some one else of those who were to get the profit is naturally supposed to be guilty, for this was not done in daylight, nor done by a frenzied crowd.

But it might be the work of some irresponsible member of the union, some weak-minded man whose passion had got the better of his judgment and prudence. There is, however, another phase of the matter. It is freely stated, and not denied, that this blowing up of a building in which non-union labor was employed is no single offense. There have been, we are told, eighty cases within six years in which structural iron bridges and buildings have been dynamited, all representing precisely the same sort of crime as does this offense. One such case could be explained, or explained away; but eighty is a different matter. They have occurred all over the country. It would seem impossible that they should not represent some common plan or agreement. One's conclusion naturally turns to the inner counsels of the union.

Under these circumstances, if the Iron Workers' Union wishes to maintain the

good will of the public it should bend its energies not so much to the defense of its secretary as to the discovery of the guilty miscreants. Just now appears a close associate of the McNamaras, and, to save his own life, makes confession that he was paid by Secretary McNamara two hundred dollars and expenses each for dynamiting a large number of these buildings and bridges. He may be lying; it may, perhaps, be a plot got up by the prosecution; but under such circumstances it would be the true course for unions which believe their officials innocent to welcome a trial which would surely acquit them. We sincerely hope that the innocence of the secretary of the International Iron Workers' Union will be established, but if so, then no effort can be too great to discover the real authors of these concerted crimes.

Dynamite crimes are quite too frequent. Dynamite can be bought very easily by any criminal. There are no adequate protective laws. Dynamite sticks can be bought about as freely as one buys a paraffin candle. There are regulations in cities, to be sure, but that is about all. In most States no record is kept of the sale or use of dynamite. Such negligence is shameful. We need general legislation, which shall allow dynamite to be kept in the possession only of authorized and registered persons and for special definite uses. The free access to such an explosive is a temptation to weak and wicked men. Every morning's paper brings its report of one or more dynamite crimes. Here is one field for legislation; but now it is the court that must act on this case, without fear or favor. If J. J. McNamara is proved innocent we shall rejoice; but if he is proved guilty the damage to this union and to unionism as a whole will be very serious and most unfortunate, unless those who are its responsible officers do their best to expose and not to conceal guilt. The fact that the Federation of Labor, under Mr. Gompers, proposes to assess five million members for the defense of the McNamaras ought to prove that its leaders believe the charges and the confession an atrocious capitalist plot against innocent men. Then let them look earnestly for the real culprits.

A British View of Our Economic State

After the prolonged discussion of wages and the cost of living in the United States which our newspapers, politicians, economists and statisticians have been conducting, it is interesting to read an entirely independent report on the subject, prepared by British Board of Trade experts and issued as a British Government document. It is one of a series of similar investigations, the others, previously published, relating to economic conditions in Continental European countries. Its conclusions in substance are, that notwithstanding the high cost of living in America, the American wage-earner enjoys an enormous advantage over his British competitor, and that it is far greater than the advantage of the British wage-earner over the German or the Frenchman.

The data were collected in February, 1909, and cover wages, hours of work, housing and rents, food prices and family expenditures. Twenty-eight towns, including the larger cities except San Francisco, were selected for the inquiry. Practically the area investigated lies east of the Mississippi River, but it contains more than three-fourths of our total population. The trades selected for the comparative investigation of wages were the building and engineering trades, and printing. Unfortunately this selection, as we shall show, qualifies the value of the conclusions arrived at, in a way which the authors of the report and the English newspaper writers that have commented upon it, have failed to perceive.

Comparing earnings in these selected trades, the American earns two and a quarter times as much money as the Englishman and works shorter hours for it, so that his hourly rate of earnings in comparison with the Englishman's is as 240 to 100. Rent is found to be, on the whole, twice as high in America as in England, and food about one-third higher; but the cost of living as a whole is found to be only as 152 in America to 100 in England, leaving a handsome balance of advantage on the side of the American wage-earner.

From these conclusions the London Times draws others which challenge scrutiny. "These facts," it says, "completely dispose of two widely current misconceptions or misstatements. One is 'that the higher wages admittedly paid in America are all swallowed up and more by the higher cost of living.' The other is 'that the inferior position in regard to conditions of living occupied by the other European countries investigated, as compared with England, is caused by their protective fiscal systems.'" These conclusions are, of course, obvious enough if the report itself stands unchallenged, but in one vitally important particular that will not do.

The reports on this subject issued by the Department of Labor at Washington, and by competent private agencies like Bradstreet's, with which our readers have from time to time been made familiar, have agreed in showing that while American wages did advance materially during the years in which the cost of living was rising to its maximum point at the beginning of 1910, the advance in wages did not in general or in the average overtake the prices of the necessaries of life. There were, however, important exceptions in certain trades; and among such were precisely those trades which the British investigators unhappily hit upon as the basis of their investigation. It is true that in the building, engineering and printing trades wage earners on the whole gained more than they lost by the upward run of prices. Mill workers in general, factory operatives and unskilled laborers, lost more thru increased cost of living than they gained in advances of wages.

The cause of the difference was so perfectly well known that it is hard to understand how the British Board of Trade should have failed to take note of it and to discount it. In the American engineering, building and printing trades the unions have had a nearly perfect organization, which has enabled them to take instant and complete advantage of the market. More than any other class of men in the country, except promoters and speculators, the wage earners in the building and engineering trades have been able to profit by "prosperity."

Notwithstanding this important qualification of the Board of Trade conclusions, it is probably true that American labor is on the whole better off than English labor, as English labor is on the whole better off than Continental European labor. The *Times* is right also in pointing out the logical absurdity of the argument that a protective tariff handicaps labor in Europe and benefits it in America. What really is proven is that free trade and protectionism as principles or theories must be cut out of the discussion of this subject if we want to get down to the facts. Actual tariffs are not constructed on any economic principle whatsoever. They are made by interests for interests, and it is not a profitable expenditure of time to demonstrate that they swell the profits and raise the wages of those elements in the population that happen to be their beneficiaries.

Certified Heroes

Mr. Carnegie's benefactions, varied as they are, have a logical connection and the funds, foundations and institutions he has established co-operate together in the advancement of his ideals. The Hero Fund Commission may be regarded as a branch of the peace propaganda to which he has in recent years chiefly devoted his money and attention. He believes that the victories of peace should be as renowned as those of war and that "the heroes of civilization" who save human life should receive the public recognition and reward which has been always bestowed upon "the heroes of barbarism" who maim and destroy.

The report issued from the offices of the commission, at Pittsburg, January 31, 1911, is an inspiring pamphlet and goes far to justify the opening sentence of Mr. Carnegie's deed of trust: "Gentlemen, we live in an heroic age." The popular taste in stories of adventure demands an increasing condensation and elimination of all detail and description unessential to the action. This pamphlet might be expected, therefore, to be more read than the periodicals devoted to the briefest and most exciting fiction, for here are 452 deeds of daring, described in about ten lines each, but in such succinct style as to convey a very clear

picture of the incident in each case. And it adds to their interest to know that the deeds we read of are not imaginary or impossible, the dreams of a professional fictionist or the embellishments of a newspaper reporter. All these have been scrutinized and attested. Ten times as many cases of alleged heroism have been considered by the Commission and rejected. The awards of the Hero Fund in the seven years of its existence have amounted in round numbers to $600,000, of which $350,000 has gone to the heroes and those dependent upon them; $150,000 has been contributed to relief funds of great disasters such as the California earthquake and Monongah mine, and $100,000 has been appropriated to the training of young men and women in the Carnegie Technical Schools. Medals have been awarded in each case: 13 gold, 195 silver and 244 bronze.

The selection of so large a number of authentic cases of contemporary heroism affords some interesting statistics. In 112 cases, or about a fourth the total number, the individual lost his life in the successful or unsuccessful attempt at rescue. The number of lives reported saved is 442, but there are besides several instances of the salvage of all the passengers of a vessel, so the total is doubtless more than five times the loss. On the whole, then, the impulse to risk one's life for others results in a gain to the community, tho it is manifestly impossible and improper to draw such a trial balance, because we know nothing of the relative value of the lives lost and saved, and heroism would be deprived of its noblest quality if such a calculation entered into it.

That heroism is not confined to a single race or sex is shown by the fact that there are 8 colored persons and 28 women among the 452 attempts at rescue, but it is of course impossible to draw from these figures any conclusion as to relative heroism, for opportunity and ability have to be taken into consideration as well as disposition.

The accidents in which the lives were endangered may be classified as follows: Drowning, 261; railroad perils, 48; gas suffocation in wells, etc., 45; mine accidents of all kinds, 37; fires, 30; runaway horses, 10; electric wires, 8; cave-ins, 5; mad dog attacks, 2; gun attacks, 2; and 1 each of danger from snake bite, fall, automobile, bull, freezing and sawmill. This does not show the relative frequency of modern perils to life and limb, but rather those in which help is most commonly possible. The water sports of boating, swimming and skating cause an appalling loss of life every year, yet they more often give opportunity for rescue than other accidents. That modern life demands new forms of heroism is shown by the number of cases of lives saved from electric shock.

These heroes represent all classes of society, and almost every occupation, chiefly, of course, those in which such accidents are most common. In age they range from 9 to 70. Classified by five-year periods the ages are as follows: 9 to 15 years, 42 heroes; 16 to 20, 75; 21 to 25, 77; 26 to 30, 63; 31 to 35, 61; 36 to 40, 48; 41 to 45, 34; 46 to 50, 25; 51 to 55, 15; 56 to 60, 6; 61 to 65, 3; 66 to 70, 2. The average age is a little less than 30. The median age or middle of the series is 28. The mode or most commonly occurring age is 22. Here again the important factors doubtless are occupation and opportunity. It may be remarked, however, that the distribution curve when plotted shows a striking resemblance for most of its length to the curve of average age of marrying.

What the effect of this fund will prove to be cannot yet be determined, but if properly administered it is impossible to see how it can be otherwise than beneficial, and there are few philanthropic donations of which this can be said. It is an amateur prize, for the conditions of the grant exclude those whose profession involves the saving of life such as firemen, policemen, etc., and the Commissioners are expressly warned to be on their guard against the danger of weakening the obligation of employers and communities to provide compensation for all the accidents incurred in the ordinary occupations. Mr. Carnegie says in his deed of trust:

"I do not expect to stimulate or create heroism by this fund, knowing well that heroic action is impulsive; but I do believe that if the hero is injured in his bold attempt to serve or save his fellows that he and those

dependent upon him should not suffer pecuniarily thereby."

This is certainly a modest expectation. We may reasonably hope that the fund may be more far-reaching than he anticipates. The indirect effect of such awards is always greater than the direct. It is questionable whether the numerous prizes offered in France for literary skill, virtue or faithful service have developed these qualities in the recipients or whether the Nobel prizes have produced any scientific discoveries, but there is no doubt that the circumstances of the awards have had a favorable effect on public opinion. It is not probable or desirable that the expectation of a Carnegie medal, even of gold, should be a motive in the mind of a young man who plunges into the river to save his drowning companions. Still the publicity and applause given to such acts contribute to the formation of the common sentiment from which spring heroic deeds.

After the Sillon

Not so long ago, the readers of The Independent enjoyed the story of the *Sillon*, which its founder, Marc Sangnier, himself wrote. The sketch was a swan note, for it explained the death of that band of French youths by order of Pius X.

Nothing daunted, Sangnier started out afresh. He began a new paper, *La Democratie*. It prospered so that he felt encouraged, with the advice of friends, to propose a new party in French politics. A public meeting was arranged for Sunday, March 26, 1911. The assembly met in a large, ramshackle building, with open roof, used as a riding school. The floor is of tan bark. About half of the space had rows of seats, behind which stood most of the crowded audience. No spark of fire, no sign of heat, was there, and yet on that wet, chilly Sunday afternoon upward of five or six thousand, among whom were hundreds of well-dressed women, paid each a nickel (25 centimes) for admission. There was perfect order; everybody seemed cheerful.. Sangnier was the principal speaker. Not a bad orator, with a clear resonant voice, he knows how to work in the pleasant story amid the sterner stuff. He held that the republic was in fact the possession of one party. Love of country and love of the republic were not the same; hence he claimed that many patriotic forces are lost to the republic. The audience understood what he meant. He brought in various topics now under discussion in French politics, such as old age pensions, proportional representation, the referendum, and so on. He had a good word for all, but—always some reserve along with it. Thus far there was nothing new or striking in the speech. But when Sangnier turned back from every day questions to the principles upon which they rest, then the Catholic was heard speaking. He expatiated long upon the dogma of laicism. Thruout his audience was with him. To the direct question whether between the Church and society some agreement was necessary, he held that there was no such need. All that was exacted from them was to put their political platform upon non-sectarian grounds, which all creeds should respect. The citizen here shows himself. The Catholic Church—Sangnier declared—asked not the civil power to favor her by any privilege. Liberty was all she wished; rather bold teaching with Pius X still at the helm. The young Frenchman seemed in 1911 to re-echo the sentiments of the young Irishman, O'Connell, when in 1829 he denounced the veto by England of candidates to the Irish episcopate: "We take our religion from Rome, not our politics."

A feature of these meetings in France is public discussions: *contradictions,* the French call them. The chief *contradicteur* was Paul Hyacinth Loyson, the son of the famous Père Hyacinth. He is younger than Sangnier; a cooler and more practised speaker also. Young Loyson described himself "as a free thinker, or, if you wish, free believer." He reminded his hearers, nearly all Catholics, that he had stood up for the defense of the Churches and freedom of teaching. Then joined in another youth, a Jew, by name Stern, whose father is the chief owner of a chain of daily newspapers, strong on financial matters, that girdle France. The bluntest question put to Sangnier

was: Suppose the Pope repudiates your democratic league, will you obey him? It was a straight question, but it got an indirect reply. In answering Sangnier quoted Pius X. as saying that in all matters outside of religion Catholics enjoy the unlimited freedom which other citizens possess. He added examples. Leo XIII. requested the German Centrum to vote for Bismarck's Septennate, but it refused. The same Pope called on French Catholics to rally around the republic, but the monarchists held back. Both centrum and monarchists did right in refusing.

There was no disorder. Within were no policemen, while the dozen or so outside had nothing to do. The founder of the *Sillon* showed more pluck than his letter of submission to Pius X. would lead any one to suspect, but he seems heroic—one may add Napoleonic—in dreaming of a new Catholic party after the repeated and contemptible failures of the past forty years. And if Napoleonic, Sangner is a fresh "back-from-Elba" who will soon find his Waterloo.

What a contrast to see the young Catholic millionaire on one side and the ex-priest's son facing him on the other. Strange sight, also, to see the young millionaire Jew standing between both. Judaism, Romanism, Rationalism! Verily the fagots of the Inquisition are quenched—and for all time to come.

In Memory of Samuel Johnson

In the year of the simultaneous publication of all the 28 volumes of the new *Encyclopedia Britannica* England honors a lexicographer whose work antedates even the original edition of the *Encyclopedia,* published in 1771. Mr. Cecil Harmsworth, a brother of Lord Northcliffe, the newspaper publisher, has stepped in and saved the old house in Gough Square, Fleet Street, where Dr. Johnson compiled that immortal dictionary best known to many persons because Miss Becky Sharp threw a copy of it at the head of Miss Jemima Pinkerton, on leaving the academy kept in Chiswick.

Samuel Johnson's Dictionary is no longer a standard work and it never did have a high philological value, yet it was of significance in its day, remains significant as an achievement, and is notable for some of its characteristic definitions—that of a patron, for example, in the framing of which definition the learned doctor revenged himself for all time upon Lord Chesterfield. The famous Dictionary was begun in 1747, and it was at the Gough Square house, which has of late years fallen into decay and would soon have literally fallen, that the lexicographer dwelt while he compiled the great work.

Doctor Johnson originally planned to complete his Dictionary in three years. When reminded that the Forty Immortals had required forty years to compile the Dictionary of the French Academy, "Sir, thus it is," he replied. "Forty times forty is sixteen hundred. As three is to sixteen hundred, so is the proportion of an Englishman to a Frenchman." It was, however, almost eight years before the Dictionary was ready, and eight assistants shared in its preparation, so that the real proportion stands 72 to 1,600. Five of Johnson's eight assistants were, as Boswell takes pains to remind us, natives of North Britain. Perhaps this long association with Scottish hacks partly accounts for Ursa Major's frequent outbreaks against the Scot—if Boswell's own personality does not adequately account for them. The house in Gough Square is to be made a kind of Johnsonian museum, and will no doubt attract almost as many American pilgrims (who know nothing of the lexicographer except what his biographer has told them) as does the Cheshire Cheese—the old inn which may or may not have been a favorite resort with Dr. Johnson. It is worth knowing that the great man received only £1,500 in all for making his Dictionary—out of which sum he had to pay his copyright expenses, the hire of his assistants, and his own bills for tea, punch, and British beef. How far, we wonder, would £1,500 go in the production of a modern dictionary worthy of that name?

A Suggestion for the New Arbitration Treaty

Senator Henri La Fontaine, of Brussels, the president of the Berne Peace Bureau, made a very interesting suggestion at a dinner given in his honor in this city last

Wednesday night by the World Federation League. He suggested that a final article might well be added to the arbitration treaty of unlimited scope now being negotiated between England and the United States, in which all other nations would be invited to adhere to the treaty. Thus one treaty would do for all the nations of the world instead of 1034, as would be required if each one of the forty-six civilized nations should negotiate a separate treaty with every other. Thus, Denmark and Holland negotiated a treaty in 1904 in which all disputes between them, of whatsoever a nature, were to be settled by arbitration, and a clause was inserted, inviting other nations to join. But being small Powers, none of the great nations have accepted their invitation. In the case of adhering to an Anglo-American treaty, however, the situation would be different, and no nation would think it beneath its dignity to join with the two great English-speaking Powers in a pact of eternal peace. We hope that it may not be too late for Secretary Knox and Ambassador Bryce to consider this suggestion.

The Social Democrats in Milwaukee

Mayor Seidel, at the beginning of his second year, sends a message to the Council. None of the city dailies publish it and they scarcely refer to it. They are as unfair toward the Socialists as they are toward all temperance movements. The Mayor has the right to boast that with all their efforts to disparage the Socialist administration, not even a covert suggestion of dishonesty is heard. The finance and accounting of the city are rapidly becoming scientific and are open to all. A complete inventory of the city property will soon be prepared. The salary orders are all made on one blank form instead of seventeen forms as heretofore. The Bureau of Efficiency and Economy is saving large sums. Untaxed property is placed on the lists, adding large amounts to the city's income. New interest is given to the Health Department. A new and large park has been purchased. For five years the city had paid annually an average of $42,423 for liabilities; during the past year only $9,500. Did the law permit the administration would have established a loan office for the poor, and engaged in the sale of ice, meat and coal. The people generally agree that the city has had a year of clean, honest and efficient administration. We have with others been too ready to consider the April election as a repudiation of the Social Democrats. It is true that they did not elect a single candidate, and they well knew they could not with both parties united on a single ticket against them. While their vote has increased at every election they have never elected by a majority vote. There seems to be no change of sentiment against them, but they are not yet strong enough to overcome the coalition of the two old parties.

Political Factors Forgotten

Important factors in political movements are sometimes quite overlooked by the public at large. It has not been quite clear why Carter H. Harrison was elected Mayor of Chicago, when the effort to improve conditions had brought about the nomination of Prof. Charles E. Merriam. But the negro journals explain Carter Harrison's success, not at all because he was supported by the free and easy interests, but because he had gained the total Republican negro vote by the fairness with which he and his father before him had treated negroes. The elder Harrison organized the first negro fire company, and appointed negro policemen, and the younger Harrison, as Mayor, had put more colored men in the departments than any previous Mayor, and had made a negro a police official. On the other hand, Professor Merriam was connected with the Hyde Park Protective Association, which, among other things, has tried to prevent negroes from holding or acquiring property in its district. It is political wisdom to give full and equal justice to all classes of the citizens, or the result may be as unexpected and unfortunate as in this case.

Education in the South

Mr. Robert C. Ogden, as president of the Conference for Education in the South, which met a few days ago in Jacksonville, Fla., would not claim that the progress he has lately seen in public education in the South is all the result of the labors of his conferences, and yet

their influence has been very great. In his address he says:

"When our work fairly took to the field in 1902 the rural local tax in North Carolina was so purely nominal as to be negligible, but in the year 1910 there was collected from 1,167 school districts that voted for the tax, in ninety-six out of the ninety-eight counties of the State, the sum of $1,171,857. In Tennessee taxation and appropriation for public education have been more than doubled within five years."

Mr. Ogden says that as a business man he has found supervision to be the key to success, and he urges importance of it in education, of which demonstration farm work gives an emphatic example. "It is a principle of humanity," he says, "that each man takes his tone from the man next above him." The application is clear—more and better supervision over country schools and city schools as well. And this means that the higher education must set the type and pace for the lower; and this is democratic.

The Music of the Future

Bernard Shaw was a critic of music before he took to writing conversations. He was always an enemy of convention, however, and he now asks us to throw ourselves a little into the future—to realize what is the larger meaning of mechanical inventions as applied to music. Hitherto the arrangement of hand and keyboard in piano playing has been the source of many imperfections; the keyboard has been a tyrant; the form and shape of our music has been due to the mechanical limitations imposed upon it thereby. The composer of the future, however, can, thanks to the pianola, compose music without any relation to the keyboard at all. What we want, Mr. Shaw says, and what we shall have eventually, is a totally new kind of music, the composer of which will not be fettered by the knowledge that the player can not get his hands wherever he pleases. With some fifty-three notes within the compass of the octave, pianotuning can be brought to such perfection that every fifth will be only the 11,000th part of a semi-tone. But with the keyboard, if there were fifty-three notes to the octave, nobody would have sufficient manual dexterity to play it. The pianola, in introducing a new kind of music, in which all sorts of intervals are employed that are not employed at present, will furnish a new technic and new resources in sound. So the great G. B. S. Incidentally, this is about the only good word we remember to have heard spoken of the pianola outside these very columns. The really important part of the outbreak is its reminder of Mr. Shaw's consistent claim that the machine has tremendous possibilities in art. He it is, be it remembered, who sets photography above painting.

A Bold Defense

Once more we are moved to commend the stand of the Atlanta *Constitution* in its repeated comments on the removal of Professor Banks from the University of Florida, because in an article in THE INDEPENDENT he ventured to express the opinion that the South was wrong in its defense of slavery and in using its doctrine of States' rights in support of slavery. *The Constitution*, of its own free will, reprints the editorial of the Jacksonville *Times-Union*, applauding his removal, and then rebukes it in a most emphatic and convincing way. It says in the issue of April 24:

"the inevitable conclusion of our contemporary's logic would be the absolute prohibition of the right of the teacher or leader to express sentiments at variance with majority, perhaps transient, belief. What that would mean other than the chloroforming of progress and the perpetuation of error we are unable to see. . . .

"This system glorifies hypocrisy, puts a premium upon cowardice, stifles the instinct to study, to discover, and toward research. It is unthinkable! Not only is the teller of truth to be sacrificed, but as well his mouth is to be sealed! In the light of such a proscription, what chance would progress or reformation stand? None. For putting a quietus upon the right of dissent would mean that, upon any question, large or small, any community, large or small, once wrong would have to stay wrong—provided those in error were in the majority. . . .

"Light! *Light!* LIGHT! That is today the South's crying need—full discussion, free discussion, the broadest tolerance, the most emphatic discouragement to the censor. . . .

"We do not want the coming generation coddled on ex parte history, or half-truths. We do not want to foist upon them predigested opinions. If they are to become men fit to wrestle with the south's destiny, they must be able to embark upon the sea of manhood able to pick the false from the true without any props or proscription. The right to know all sides is their birthright. If we withhold that right we shall make our in-

stitutions forcing plants for weaklings; propagators of error—and we shall cheat the south of its destiny."

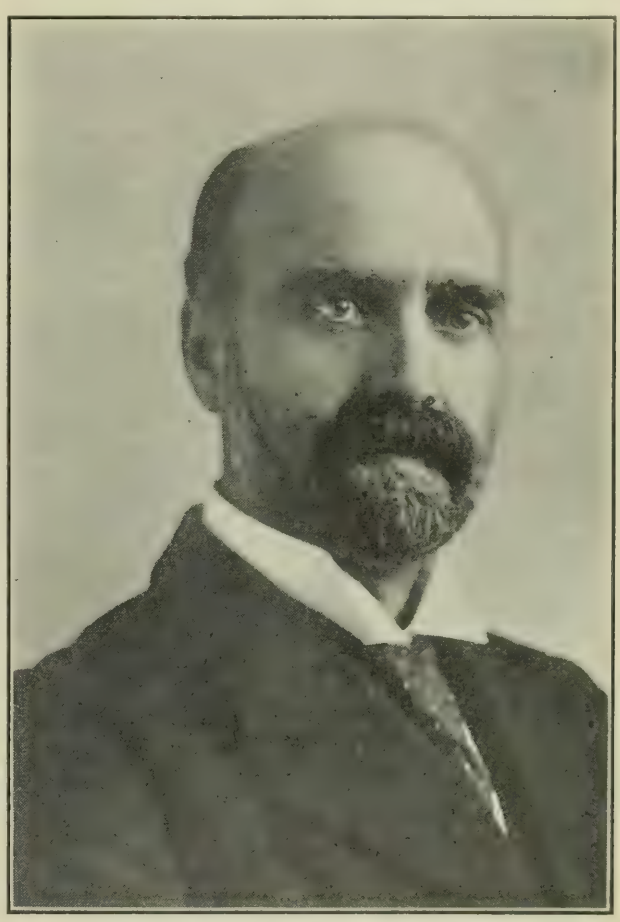
The true principle could not be better exprest. Its utterance by a leading journal in the heart of the South is a promise of intellectual liberty.

An Anti-Gambling Governor

The Colorado legislature passed an amazing bill to permit and foster gambling at horse races. It provided for a State Racing Commission to have control of horse races with this provision:

"It shall be lawful to buy and sell pools on races or contests of speed and endurance between horses under the pari-mutual system, and for the association or corporation conducting said meeting to receive therefor a commission not exceeding 5 per cent. on the amount of pools so sold."

But in passing the bill the legislature did not take in account Governor Shafroth. He promptly vetoed the bill. He instructed the legislators with these ringing words:



"It has been recognized for years that the effort by gambling to get something for nothing is the greatest destroyer of the moral sense known to man. In cases of gain it leads the young man to an extravagance which produces a restlessness and recklessness unfitting him for business. In cases of loss it often leads him to borrow, then to embezzle, then to steal, then to rob and then sometimes to commit suicide. This is not the recital of the facts of one case, but the history of thousands every year. It may be said that legalized gambling is the school wherein is taught all the vices known to mankind. It is bad enough when such places are conducted by men who are tempted to do so for gain, but how can it be characterized when the law directs that the governor of the State shall appoint commissioners who become State officers to manage and control such transactions in the name of the State?"

The Governor then declares that if they pass this bill over his veto he will appoint with it no such commission until compelled to do so under mandamus from the highest court in the land, and he thus concludes:

"The people are tired of this long session of the General Assembly. We should enact promptly and not evade the promises we made to the people, and if we pass such measures as this race track gambling bill, God pity the party that is responsible therefor."

We believe that the people of Colorado thus appealed to will sustain their plain spoken Governor.

The trustees of New York University have made an admirable choice in the election of Elmer Ellsworth Brown, United States Commissioner of Education, as its president, and successor of President MacCracken. Dr. Brown has been an educator and a student of education all his active life. He is in the prime of his powers, fifty years old, and has conducted with great efficiency the important office he has held in Washington. He is a man of affairs, a good counselor and administrator, and has a thoro knowledge and experience in the art of education, whether in the public schools

ELMER ELLSWORTH BROWN,
The new president of New York University.

or in the universities. The New York University has connected with it very large and important graduate departments and has proved its right to exist by the side of the Columbia University. An even greater growth and leadership may be expected under the new administration.

The prices for rare books at the late Hoe sale in this city ran up beyond all precedent. That means that there is more wealth and there are more rich men eager to boast of possessing literary

treasures valued by their cost price. Not one of the editors of THE INDEPENDENT cared to compete for the Gutenberg Bible, which went for $50,000. Indeed, in the primitive Gothic typography, it would not have been to our edification to try to read the Latin text, and we have already several copies in a better translation, which answers our purpose, whether for reference or devotion. Yet we do not object for public and private museums to objects valued for their antiquity or rarity rather than for use. They all have some occasional use in the history of the arts, and the collectors are welcome to them, particularly if scholarship can get some good out of them.

The whole world is not all in Boston this week, but a large part of it is represented in the interest of foreign missions. It is a huge show of the condition of society and religion in all parts of the non-Christian world, dramatically arranged, with tableaus, moving pictures and pageants, interspersed with lectures and addresses by missionaries that happen to be on furlough in this country. The residents of Boston and vicinity have given much time and labor to perfecting this exposition, and nearly a thousand persons take part in costume at every presentation, either as performers or singers in the great choir. It is well worth seeing and hearing, and we wish it could be reproduced in other cities.

Sophie, aged nine years, was found by the immigration doctors to have trachoma, a disease of the eyes causing granular lids. Therefore she is deported, and sent back to Holland under care of her brother. The father and mother and three other children may stay, but the child with trachoma must go back. The father has sold his farm in Holland for $5,000, is perfectly able to take care of his family, and will settle in Iowa. This seems a hard case and we raise the question whether it represents either justice or mercy.

The Pittsburg Presbytery, one of the very largest and strongest and most conservative in the denomination, by a vote of 53 to 23 has refused to adopt the overture to the General Assembly asking it to investigate the doctrinal soundness of President Francis Brown and Prof. William Adams Brown, of Union Theological Seminary. They have acted very wisely. The adoption of the overture would have involved a heresy trial, very likely, and that would very possibly have disrupted the Presbyterian Church, as a similar trial did disrupt the Church, to no advantage of the faith, seventy-five years ago. A creed is to be a garment for comfortable wear, not shackles to prevent freedom of movement.

A six-million-dollar fire at Bangor, Me., in which lives were lost and limbs broken, serves as one more reminder of the flimsiness of American building construction. The tourist in Europe may spend weeks in a city without seeing either a fire or a fire engine, but in American cities the efficiency of the fire fighters is matched only by the criminal frequency and deadliness of conflagrations. A great fire brings this one benefit to a community: the opportunity to rebuild safely and sanely, as well as in good taste architecturally. But it is an opportunity almost invariably neglected. San Francisco threw her chance away in the interest of short-sighted investors and real estate speculators.

Oklahoma race legislation is driving out of the State a multitude of its negroes who are fleeing to Oklahoma. They do not like the "Jim Crow" coach and depot laws, the separate school laws and the restrictions on their voting. The first party of emigrants consisted of about 500 negroes, and 5,000 are going in the second party. Where is the statesmanship of such legislation?

It is anticipated that a Jew, Sir Matthew Nathan, will succeed Sir Eldon Gorst as British Resident and real ruler of Egypt. It is a pity his name is not Joseph, for Joseph was the last previous Jew to hold that responsible office some 3,500 years ago.

The Socialist Party in Congress has just introduced a bill into the House of Representatives to abolish the United States Senate, but he does not expect to carry it this session.

Insurance

Insurance Companies' Stock Holdings

THERE will be a strong opposition to the movement of the life insurance companies to amend the insurance law requiring the companies to sell all bank shares and other stocks now held as investments by December 31, 1911. Superintendent Hotchkiss is against the amendment, altho he is willing to extend the time limit in which the stocks must be sold. He believes the requirement to dispose of the stocks is an integral part of the Armstrong law, which prohibited the further acquisition of stocks and bonds of this kind and also directed the sale of those held by the companies at the time of the investigation. It was then thought that the holdings of this class of investments put the funds of life insurance companies in jeopardy, as it permitted the companies to control certain large financial institutions.

Recent reports show that the three large New York companies affected by this law have since the investigation disposed of 38 per cent. of their proscribed holdings, but still possess about $80,000,000 at present market values. Over one-half of this sum is held by the Mutual Life, about one-third by the Equitable Life, and about one-tenth by the Metropolitan Life. The insurance department feels there is not sufficient justification and no present need for the repeal of the law, and also that the proposal is supported only by company managers and not by the policyholders or the public generally. In their opinion the real remedy is thru a substitute bill providing for an extension of time within which the sale of the stocks must be accomplished.

The side of the life insurance companies is well presented by William A. Day, the newly elected president of the Equitable Life Assurance Society. He believes the law in question, unless repealed, will inflict great loss on the life insurance companies. In June, 1906, the Equitable Life held $38,000,000 in corporate stock largely invested in high-priced shares of banks and trust companies, for which there was no general market. The society still holds a major part of these stocks, as it has been unable to dispose of them at a satisfactory price. In President Day's opinion the amount individual investors might absorb would be insignificant, compared to the very large amount to be disposed of, and thus the only purchasers would be great capitalists and syndicates, who would make no move until the period of grace was about to expire, when they could dictate their own prices. President Day concludes that it would be better for all concerned if the life insurance companies were allowed to retain their present holdings, but not to increase them. In this way the holdings would become relatively smaller from year to year as the investment in other securities progressed.

NEW YORK CITY spends $10,000,000 a year for fire extinguishment and $15,000 a year for fire prevention. If more money were spent for fire prevention less would be needed for fire extinguishment. Edward F. Croker, the able fire chief of New York City, who has just resigned his position, has announced that he will devote himself hereafter to fire prevention. This is an excellent field for a man of such wide and varied experience.

AN English insurance journal makes the following reference to the large steel-frame buildings that are increasing so rapidly in number thruout our country:

"The New York and Chicago 'sky-scraper' is always paraded, not only as being among America's most wonderful building achievements, but it is invariably represented boastfully as being 'fire-proof.' The truth, however, is—if we are to believe the deplorable facts we see—they are simply imposing impostures."

THE Attorney-General of the State of New York has held that it is illegal for a fire insurance company to place its funds in the hands of bankers for the purpose of loaning them upon call.

Financial

The Steel Corporation

QUARTERLY reports of the Steel Corporation are regarded with much interest in the business world, because they indicate the ebb and flow of trade. The report for the quarter which ended with March was not encouraging. It showed that the net earnings had been less than those of the preceding (December) quarter by $2,500,000, and less by $14,000,000, or 37 per cent., than those of the corresponding quarter one year ago. After the payment of dividends, interest and sinking fund charges, only $31,155 remained, and there could be no appropriation for new construction, for which $5,000,000 was set aside in the March quarter of 1910.

Those who inspect the Corporation's reports will see that in 1908, following the panic, net profits were low, and that they grew steadily in 1909, when the quarterly returns were as follows: First, $22,921,268; second, $29,340,491; third, $38,246,907; fourth, $40,971,309. The figures given below show the sharp decline in the closing months of 1910:

1910	First	$37,616,876
	Second	40,170,960
	Third	37,365,187
	Fourth	25,990,978
1911	First	23,519,203

There was a steady increase, by months, in the March quarter, and this would indicate larger profits in the June quarter, if it were not known that, since April 1, several of the Corporation's furnaces have gone out of blast. A decline of demand, causing reduction of output, is due to pending tariff legislation and retrenchment on the railroads.

It appears that the sudden suspension of all construction work on the new plant at Corey, Ala., was due to a misinterpretation of the orders, which were that there should be suspension as to part of the work for a time. Work was resumed last week, and the extensive plant will be completed, altho, if wire and wire rods should be placed on the free list, the company would probably change its plans and use the factories for the manufacture of other products. Judge Gary explains that there was no intention or effort to influence or oppose legislation. "We present our views and reasons when asked," he says, "but submit without question to the decision of those who are responsible for legislation and its results." It would have been great folly for the Corporation to attempt to influence legislation by a sudden suspension of this construction work, at a time when the Democratic majority in the House was considering a resolution for the appointment of a special committee to ascertain by thoro investigation whether the Corporation has violated the Anti-Trust, Interstate Commerce or National Banking laws.

....About 100 miles of new railroad will be built in Northern Maine this year.

....In Ohio, the increase in the value of farm land and buildings, from 1900 to 1910, was 59 per cent.

....Reports to the *Journal of Commerce* indicate an increase of 5½ per cent. in the cotton acreage. Oklahoma leads, with a gain of 21½ per cent., and Louisiana, with 15 per cent., is second.

....In April, only 4.706,180 shares of stock were sold on the New York Stock Exchange. This is the smallest number reported in any month since August, 1900. In April, 1901, the sales were 41,726,800.

....The Citizens' League for the Promotion of Monetary Legislation is the name of a new organization formed in Chicago to conduct an educational campaign on lines suggested by the Monetary Commission. It will have auxiliaries in all of the large cities.

....A Census Bureau report shows that the value of farm land and buildings in Nebraska rose from $577,660,000 in 1900 to $1,811,577,000 in 1910, an increase of 214 per cent. The advance in farm land alone was from $486,606,000 to $1,613,077,000, or 231 per cent.

The Independent

VOL. LXX NEW YORK, THURSDAY, MAY 11, 1911 No. 3258

Survey of the World

Woodrow Wilson Speaks

In the first speech of his Western tour the Governor of New Jersey addressed the Knife and Fork Club, of Kansas City. "There can be no mistaking the fact that we face political changes which may have a very profound effect upon our political life," he said. "Those who do not understand the impending change are afraid of it. Those who do understand it know that it is not a process of revolution, but a process of restoration, rather, in which there is as much healing as hurt." Again, "The people have been cheated by their own political machinery." Wealth is not in itself the enemy, but wealth which controls not industry and commerce alone, but politics, is, in its results, corrupting to the individual and ruinous to the State. The methods of our legislative procedure tend to simplify the operation of bipartisan machines. Various remedies have been suggested, among them the initiative, referendum and recall:

"If we felt that we had genuine representative government in our State legislatures no one would propose the initiative or referendum in America. The most ardent and successful advocates of the initiative and referendum regard them as a sobering means of obtaining genuine representative action on the part of legislative bodies. They do not mean to set anything aside. They mean to restore and influence, rather.

"The recall is a means of administrative control. If properly regulated and devised it is a means of restoring to administrative officials what the initiative and referendum restore to legislators—namely, a sense of direct responsibility to the people who choose them.

"The recall of judges is another matter. Judges are not lawmakers. They are not administrators. Their duty is not to determine what the law shall be, but to determine what the law is. Their independence, their sense of dignity and of freedom, is of the first consequence to the stability of the State. To apply to them the principle of the recall is to set up the idea that determinations of what the law is must respond to popular impulse and to popular judgment.

"It is sufficient that the people should have the power to change the law when they will. It is not necessary that they should directly influence by threat of recall those who merely interpret the law already established. The importance and desirability of the recall as a means of administrative control ought not to be obscured by drawing it into this other and very different field.

"The second power we fear is the control of our life through the vast privileges of corporations which use the wealth of masses of men to sustain their enterprise. Those who administer the affairs of great joint stock companies are really administering the property of communities, the property of the whole mass and miscellany of men who have bought the stock or the bonds that sustain the enterprise. The stocks and the bonds are constantly changing hands. There is no fixed partnership.

"What is necessary in order to rectify the whole mass of business of this kind is that those who control it should entirely change their point of view. They are trustees, not masters, of private property, not only because their power is derived from a multitude of men but also because in its investments it affects a multitude of men. It determines the development or decay of communities. It is the means of lifting or depressing the life of the whole country. They must regard themselves as representatives of a public power."

May Day Strikes

Pennsylvania Railroad shopmen between Pittsburgh and Altoona struck, unexpectedly, on May 1. Fifteen hundred men went out, and the American Federation of Labor asserted that eight or ten thousand Pennsylvania employees would soon be involved. This prophecy, or threat, has failed of verification, altho, on the sixth, sympathetic strikes were inaugurated at the Ormsby

shops of the Pennsylvania's Monongahela Division and at the Glenwood shops of the Baltimore & Ohio Railroad. The question at issue in the original strike is the recognition of the union, and the controversy arose three months ago, when the railroad began to lay off shopmen in pursuance of its policy of retrenchment. Early this week the cause of the strikers was regarded as unlikely to attain success. There have been few delays in the Pennsylvania system as a consequence.——On May 1, 10,000 men, engaged in five industries, went on strike in Chicago. Railways, building and metal trades, and brick-making industries were affected. The strikers' demands range from higher wages and shorter hours to various questions of detail and of union recognition. A threat of a strike of freight handlers and machinists at Chicago was also made. This is likely to be averted.——New York machinists went on strike May Day, their number being estimated at 9,000 by Tuesday of last week. Practically no time for the consideration of their demands for a reduction of the working day from nine to eight hours, at the same wages as are now paid, was allowed by the strikers, and manufacturers declare that the demands are unreasonable, stating that hours were only recently reduced from ten hours to nine, and that wages have been steadily advancing, as has also the cost of materials. ——Two thousand New York boilermakers struck, May 3, for an increase of 50 cents per day.

Bribery Cases

On Tuesday of last week Charles H. Hyde, City Chamberlain of New York, an appointee and protégé of Mayor Gaynor, was arraigned before Justice Vernon in the Criminal Branch of the New York Supreme Court on an indictment charging him with bribery and with taking an unlawful fee. It is alleged that Hyde agreed, August 22, 1910, with Joseph G. Robinowitch, alias Robin, then chairman of the executive committee of the board of directors of the defunct Northern Bank and owner of a majority of the bank's stock, that if the bank would loan $130,000 next day to the Carnegie Trust Company (which, even then, was in a weakened condition) he, the City Chamberlain, would immediately increase the amount of daily balances of the city funds on deposit with the Northern Bank. The indictment charges that the loan was so made, and the deposits duly increased. Thru his counsel, Samuel Untermeyer, the defendant pleaded not guilty, and was released after Commissioner of Taxes Daniel S. McElroy had gone on his bail for $7,500. Hyde has until May 16 to withdraw his plea or make such motions as may be deemed necessary by his counsel. The Chamberlain was nonchalant during his arraignment. Later the same day, however, he sent his resignation to the Mayor, who, in accepting it, exprest himself as satisfied that Hyde is "honest and correct to a dot," and as grieved "to see any such man sacrificed even for the time being." Hyde received the appointment January 3, 1910. He is succeeded by Robert R. Moore, president of the Commercial Trust Company, who ran on the Democratic ticket with Mayor Gaynor as candidate for Comptroller in 1909. The salary of City Chamberlain is $12,000 a year.——The Senate Committee on Audit and Control of the Contingent Expenses has ordered a favorable report to the United States Senate of the La Follette resolution authorizing a new investigation of the election of William Lorimer as Senator from Illinois. The resolution provides for the appointment of five new Senators as investigators, and ignores the Senate Committee on Privileges and Elections, nine members of which are understood to be friendly to Mr. Lorimer. The resolution was not to be reported, however, until early this week, the delay being made at the request of its sponsor, the Senator from Wisconsin. On May 6, Edward Tilden, president of the National Packing Company, and accused of being treasurer of the Lorimer "slush fund" of $100,000, was ordered released from the custody of an officer of the Illinois Senate by Judge Petit, of the Cook County Circuit Court. This order is regarded as knocking the bottom out of the Helm Committee's investigation of the Lorimer election, and attention is now focussed upon the action of the Federal Senate. Similar orders were issued by the court in favor of George M. Benedict and William C. Cummings, Chicago

bankers accused of complicity in the case.——On Tuesday of last week the Franklin County, Ohio, grand jury indicted five members of the State Legislature on the charge of soliciting bribes, and an officer of the Legislature on the charge of abetting bribery. The accused were released by the court on bonds of $5,000 and $10,000 respectively. About forty members are said to be involved. Evidence in these cases was collected by the Burns Detective Agency. The detectives played the rôles of lobbyists, and as such practised bribery. They were interrupted in their work by being arrested as corruptionists; at their hearing it came out that they were in the employ of the Ohio Manufacturers' Association, and were working only to secure evidence of legislative venality. The average price of an Ohio representative is $200. Legislators were interviewed by the detectives in the hotel rooms of the latter, where a dictophone, concealed under a couch, and a stenographer, otherwise concealed, took down the compromising conversations. The indicted members have pleaded not guilty and will be placed on trial next week. On Governor Harmon's insistence, a legislative investigation has been headed off, because, under Ohio laws, guilty persons win immunity from prosecution by confessing before a committee of legislators. The Governor and his Attorney-General say they want to send to the penitentiary every man smirched: "Altho we are Democrats, we will not protect dishonest Democratic legislators." On May 4 the Ohio House of Representatives passed without a dissenting vote a bill making the penalty for bribing a public officer or member of the Legislature one to ten years' imprisonment, without the alternative of a fine. It is predicted that the revelations already made have led the lawmakers to see a great light, and they are expected to carry out Governor Harmon's legislative program, which they have been holding up.

An Alaska Coal Party

The Government's delayed adjustment of the Alaska coal land cases has disappointed citizens of the territory, and on May 4 300 persons marched to the dock of the Alaska Steamship Company, at Cordova, and proceeded to shovel many tons of coal imported from British Columbia into the bay. The president of the Chamber of Commerce, an ex-Mayor of the town, and several Councilmen were members of the mob. When the Chief of Police ordered them to disperse the president of the Chamber of Commerce, A. J. Adams, shouted: "Shovel away, boys! We want only Alaska coal." The threat was uttered that another demonstration would be made upon the arrival of the steamship "Edith," which is soon due to arrive with a cargo of 3,500 tons of Canadian coal, and the Mayor of Cordova has appealed to the Governor of Alaska, who is in Connecticut, for assistance. This adaptation of the Boston Tea Party to present-day conditions in Alaska is the culmination of a series of indignation meetings over the withdrawal of coal lands from registry, held in Cordova and neighboring towns. Gifford Pinchot, former Chief Forester, and apostle of conservation, has been burned in effigy at Katalla, Alaska. The dissatisfaction was hightened by the Administration's delay in acknowledging protests cabled to Washington at the tying up of natural resources thru legal proceedings. Attorney-General Wickersham has ordered United States Marshals in Alaska to report upon present conditions and to take steps to protect shipping at Alaska. The new Secretary of the Interior, Walter L. Fisher, has instructed Walter E. Clarke, Governor of Alaska, to suppress disorder. Secretary Fisher says that the opening of the coal lands is a matter for Congressional adjustment. The Cunningham claims are in the neighborhood of Cordova.

Various Items

On May 4 Ortie E. McManigal told the Los Angeles grand jury the story of the dynamitings in which he says he participated with James B. McNamara (alias Bryce), and of which he says John J. McNamara had full knowledge. The session of the grand jury prefaced the return of nineteen new indictments against the McNamaras on Friday, when they were remanded to jail without bail. The prisoners will probably plead to the charge against them

June 1. McManigal did not appear at the arraignment, and it is evident that he will be the chief witness for the prosecution and will leave his fate to the mercy of the court.——Three thousand women and a delegation of members of the Men's League for Woman Suffrage paraded in New York City on May 6. The women received a good-natured reception from the crowds which lined their line of march.——The Third National Peace Congress was held in Baltimore last week. We discuss the congress editorially, and publish the address of the presiding officer. On Friday representatives of the twenty-one members of the Pan-American Union presented a gold medal to Andrew Carnegie in recognition of his efforts for peace and international amity. Afterward Mr. Carnegie informed John Barrett, director of the Union, of his wish to present $100,000 in addition to his earlier gifts of $750,000 to the Union, the sum to be expended in the furnishing and decoration of the Union's building at Washington.

Mexican Peace Negotiations Interrupted

Peace negotiations between the representatives of Madero and those of the Diaz Government were suspended abruptly on the 6th, the term of the armistice was permitted to expire, and the revolutionists resumed their preparations for an attack upon Juarez. All this was due to the refusal of President Diaz to resign. On the 4th, Madero and the commanders associated with him directed their Peace Commissioners to propose the resignations of both Diaz and Madero, and also that of Vice-President Corral, with the understanding that Señor De la Barra should be President during the interval before a new general election. In his written statement, Madero said that "in general, the conditions of peace" had been accepted by him in telegrams transmitted by the Government's agents, Señors Braniff and Obregon. But certain gentlemen, "acting as go-betweens," had in a confidential way told him that Diaz had "made known to them his irrevocable resolution to retire from power as soon as peace is established":

"This resolution appears to me to be highly patriotic, because in the present moment it is the only one which can satisfy public opinion; and I am convinced that if General Diaz makes public this intention it will permit us to pacify the country in a very few days."

Señor Braniff admitted that he was one of the gentlemen who had told Madero in confidence about Diaz's determination to retire. But the old President had said to him that he could not "retire under the pressure of an armed revolution." The revolutionists' ultimatum was sent to the Mexican capital. No reply was received on the 5th. A long meeting of the Cabinet was held there. Diaz would not yield. He said to an old friend: "I came into power fighting, and I shall fight to the end." At the close of this Cabinet meeting, De la Barra was in tears. Diaz said to his wife, who was urging him to resign and go abroad: "You may go to Europe; I prefer to stay here and die in harness." On the 6th the Government's Peace Commissioner informed the representatives of Madero that it was impossible to continue the negotiations on the basis proposed, meaning the resignation of Diaz. Whereupon Dr. Gomez gave notice that the peace negotiations were at an end, and the Government forces in Juarez prepared to resist assault. It is understood that an agreement was near at hand, so far as other conditions were concerned, and that Madero was forced to demand the resignation of Diaz by the attitude of the military commanders associated with him.——On the night of the 7th, after a Cabinet meeting, President Diaz issued a manifesto to the Mexican people, declaring his intention to resign as soon as peace should be restored, "when I am sure that my resignation will not be followed by anarchy." He fixed no date, nor did he speak of a new election. This manifesto was not forwarded to Madero or to Peace Commissioner Carbajal. Friends of the President asserted that Madero had broken a private agreement excluding resignation as an issue at the conference. Madero received the news about the manifesto with joy and sent to Diaz a telegram congratulating him on his patriotism. He would consent, he said, to another armistice and would resume the negotiations. "The primary condition," said Peace Commissioner Gomez, "has now been satisfied, and other conditions will present no difficulties." To avoid complications with

the United States, Madero had ordered the rebel troops to refrain from attacking Juarez, or any other town on the border, "sacrificing the great military advantage of the capture of Juarez," as he said, to prevent a collision with a nation "which has often given us proof of its friendship." He had given orders for a movement toward the Mexican capital, and the troops at the camp near Juarez were already marching southward when he heard of the manifesto and recalled them.

Attitude of Our Government

Before the negotiations were broken off, our Government was regarding the situation with grave concern. Thruout last week its reports were of a discouraging character, especially those relating to the condition of the country within a hundred miles of the Mexican capital. German residents had appealed to their home Government for the protection which the Diaz Government was unable to give. The railroads were tied up. Three-quarters of Mexico was in revolt, and half of it had virtually been abandoned by the Government forces. There was anarchy in several States. On the 5th, reports from twelve places were given to the public by our State Department. The situation in the vicinity of Acapulco was said to be intolerable. On a ranch there, two sons of Judge Goodman, an American, had been murdered by revolutionary bandits. These twelve reports related to outrages of various kinds, indicating a condition of anarchy and the inability of the Mexican Government to preserve order. It was thought that the State Department, by thus departing from its usual course, sought to prepare the people of the United States for even worse news or for a consideration of ultimate intervention. There were rumors that steps toward intervention had already been taken. It was asserted that General Wood, addressing the House Committee on Military Affairs, on the 5th, said:

"Intervention must come. Conditions in Mexico are such that troops must be sent. It will take more than 200,000 American soldiers to police Mexico, but in my opinion it is unavoidable."

President Taft hoped that intervention could be avoided. But there was evidence that the Diaz Government was going to pieces, and that many of the soldiers in its small army were inclined to turn against it.——On the 7th, President Taft spoke of a report, published in a New York Socialist paper and telegraphed to the Mexican capital, that our Government was preparing to intervene by way of Vera Cruz and to call for 200,000 volunteers. This report, he said, was "maliciously false."

Growth of the Rebellion

While there was peace in the armistice zone, near Juarez, during the week, the war was in progress elsewhere thruout the country. The capital was in danger. To the neighboring State of Puebla a general and 1,200 soldiers were sent. He returned a few days later with only 200. At Cuernavaca, 75 miles from the capital, the revolutionists were in full control. Germans there appealed in vain to Diaz for protection, and then appealed to the Government at Berlin. Americans at the capital quietly organized for defense. The negotiations with the rebels in Guerrero and Morelos for an armistice came to an end with the suspension of the negotiations at El Paso, the rebel commander in those States having formally acknowledged the authority of Madero. The capital of the State of Durango was captured, also Topolobampo. Towns near Torreon fell into the hands of the rebels, and at the end of the week it was reported that Torreon itself, a city of 30,000 people, had also been taken. Preparations for attacks upon the border towns of Nogales and Nuevo Laredo were made. At Nogales the conditions are like those at Agua Prieta and Douglas; a street is the boundary line between the American half and the Mexican half of the settlement. At Otates, in Sonora, a small force of Federals was almost annihilated; only four escaped death. From many parts of the northern States came reports of barbarous warfare.

National Insurance Bill

The way having been cleared by the passage of the Veto bill, the British Parliament can now take up the constructive legislation which the Liberal Ministry has been preparing. The most important part of this is the group of

measures designed to alleviate poverty. Two of these measures are already in operation, the pension system for workingmen over sixty-five and the labor exchanges by which persons out of employment may be sent where there are vacancies in their trades. The measure just introduced by Chancellor of the Exchequer Lloyd-George is the next step in this policy, and provides for the insurance of working men against both sickness and unemployment. The insurance against sickness is compulsory and will apply to all wage-earners making less than $800 a year, with the exception of persons over sixty-five, who may come under the old age pension act; soldiers, sailors, teachers and civil servants, who will be provided for by special legislation; and casual laborers and those having no definite employer, who may, however, take advantage of the provision for voluntary insurance. Each wage-earner will have a card on which the necessary stamps must be applied each week, a man contributing 8 cents and a woman 6, and the employer in either case 6 cents. To this the State adds 4 cents. A man receiving less than 62 cents a day pays 6 cents, instead of 8; if less than 50 cents he pays 4, and if less than 37 cents he pays 2 cents, the difference being made up by the employer who profits by this cheap labor. The money so collected will be invested by the State and is expected to be enough to provide free medical attendance and an allowance of $2.50 a week for three months' sickness and in case of permanent invalidity a pension of $1.25 for life. Much of the relief work will be done by the existing friendly societies. A woman who marries and gives up regular outside employment ceases to contribute to the insurance fund and to receive its benefits but if she becomes a widow and earns her own living again she will pay the same rate as before and receive the same insurance whatever her age. A maternity allowance of $7.50 is provided in the case of the wife of a State insured man. Those who are not receiving wages but earning an independent living may take out voluntary insurance on the same terms, the men contributing 14 cents and the women 12 cents a week. It is estimated that the compulsory class will include 9,200,000 men and 3,900,000 women, and the voluntary class 600,000 men and 200,000 women. The contributions of the Government are expected to amount to $12,500,000 the first year and $16,50,000 in later years.——An important feature of the plan is the improvement of hygienic conditions and the elevation of the medical profession. Mr. Lloyd-George stated that consumption is causing 75,000 deaths a year and that the Government proposes to help the doctors in crushing out the disease. Sanitariums for consumptives are to be established in various parts of the country with the aid of the Government which will contribute $7,500,000 for buildings and $5,000,000 a year for maintenance. ——The plan for insurance against unemployment has been already outlined in this department. It will be at first applied only to the building and engineering trades, comprising about 2,400,000 workmen. The weekly contributions will be 5 cents from each employee and the same from his employer, supplemented by a fourth of the total by the State. In case the insured workingman is thrown out of employment thru no fault of his own and not on account of strike or lockout, he may receive a benefit of $1.75 to $3.75 until he finds work or it is found for him by the national labor exchanges.——Mr. Lloyd-George's plan meets with approval from all sides, the only fault found with it being on the ground of expense. The Unionists will not regard it as a party measure and the opposition will be confined to criticism of details.

Veto and Suffrage Bills

The bill restricting the veto power of the House of Lords was passed by the Committee of the Whole on the night of May 3, by a vote of 265 to 147. There were no important changes made in the bill during its consideration in the committee stage, except one amendment which was accepted by the Government. This extended the time the House of Lords may delay the passage of a bill by counting the two years from the second reading of a bill instead of its introduction. The strength and stability of the Government was shown by two important test votes. The

Labor party opposed the preamble of the bill because it provided for the reform of the House of Lords instead of its abolition, but the motion to eliminate the preamble was defeated by 218 to 47. Mr. Balfour said that he regarded the preamble as indefinite and illusory, but wished to see the Government carry it out and therefore the Opposition would not vote against it. The home rule question came up on a motion to exclude from the operation of the bill any measure to establish a separate parliament and executive for Ireland. Premier Asquith stated that he had made it perfectly clear during the campaign that if the Government were returned, it would use its powers for the purpose of carrying into law a measure of home rule for Ireland. The anti-home rule amendment was defeated by 284 to 190.——The bill granting the parliamentary suffrage to women was voted its second reading by a majority of 167. This is a compromise measure giving the vote to women who are householders in other constituencies than their husbands. A similar bill passed its second reading in the last Parliament, but by a much smaller majority than the present.

Australian Interstate Commerce

The question of national versus State rights which has formed a party division line thruout the history of the United States has already become a dominant issue in the young Australian Commonwealth. The principle is involved in the pending question of the Federal control of commerce and industry, and a referendum which has just been taken shows that the State rights sentiment is dominant. The issue rose from the decision of the Federal High Court, which held that, while according to the Constitution the Federal Parliament has power to legislate on trade and commerce "with other countries and between the States," and for the prevention and settlement of industrial disputes "extending beyond the limits of any one State," it had not jurisdiction over trade, commerce and industry wholly confined to a single State. This crippled two laws from which the Labor party had hoped much, namely, the Conciliation Arbitration Act and the Australian Industries Preservation Act, commonly known as the "anti-trust act." To bring the matter before the people a referendum was called for on two measures. The first explicitly conferred upon the Federal Parliament powers over all matters of trade, commerce and industry within the Commonwealth, and made the Federal Arbitration Court the supreme court of appeal in all industrial questions. This was defeated by a vote of 687,000 to 443,000. Only one of the six States, Western Australia, voted in favor of the changes. The second measure, which was defeated by about the same vote, provided that the Federal Parliament should have to acquire on just terms and carry on any business or industry or the supplying of any services which in its opinion had become a monopoly. This is regarded as a necessary part of the tariff policy in order to insure that the protected manufacturer sells at reasonable prices and pays fair wages. The Government in appealing to the people expressly disclaimed any intention to nationalize all industries. It wished only to take over those from which competition is excluded and which "enable a very few rich men to exploit the whole community." The defeat of these measures does not imply any setback in this policy, but only that the individual States preferred to take over these monopolies rather than leave them to the Federal Government.

The Moroccan Situation

Altho Major Bremond's column successfully reached Fez and doubtless saved that city from capture, it does not seem to have quieted the country, but rather the contrary. The tribes between Fez and Tangier are incensed at the passage of the foreign expedition thru the country and have proclaimed a holy war against the infidel. Fez is more closely invested than ever and provisions are hard to get. The supply of petroleum and sugar is exhausted and meat is scarce. The surrounding tribes continue their skirmishes and make occasional demonstrations against the city walls. On account of the diplomatic difficulties France is moving slowly in the matter of relief.

Woodrow Wilson, Governor

BY JAMES KERNEY

Editor of the Trenton Evening Times.

WITHIN the brief period of three months Woodrow Wilson has brought about the complete political emancipation of one of the most conservative of the stand-pat commonwealths of the United States. New Jersey, known thruout the land as the "Mother of Trusts," had long come to be regarded as the State where, next perhaps to Rhode Island, the corporation and its ally, the political machine, had the most absolute hold. Fresh from his serene labors as the president of a great university, the "scholar in politics" was inaugurated Governor on January 17, and between that date and the adjournment of the Legislature, on April 21, he had forced the enactment of what are said to be the most radical laws that have as yet been framed by any State. The word forced is used advisedly, but the steam roller methods of Woodrow Wilson are not to be confounded with those involving the bestowal of patronage or the threats that have sometimes been employed in other cases. He won the Legislature by the persuasive argument process, and so well did he succeed that before the end came, he was actually getting more enthusiastic help for his reform program from a Republican Senate than from a Democratic House of Assembly. In publicly acknowledging the fine work performed by the Senate, Governor Wilson very generously said:

"Most men are beginning to realize that it is only an artificial process that divides Democrats from Republicans in the State Senate, or in State politics, as, in fact, in city and county politics and issues, which surely have no connection with the great party divisions in national politics. We have realized that in the present session of the Senate, and realized, too, that we are in a day which differs from the days that are gone before and which required different political attitudes and codes. The only essential in American politics today is the difference between Progressives and Reactionaries. We have in the last ten years come out of the period of merely negative politics, politics which consisted wholly of attacking, abusing and heaping objurgation upon men and measures of other political faith. All these things weave us together as a common family, seeking to serve, as well we have served, our great commonwealth."

LaFollette and his associates battled for years for the passage of such drastic legislation in Wisconsin; and the other progressive States of the West, where the ardor of a more adventurous political blood holds sway, have none accomplished greater reforms, after years of labor, than has been accomplished by this remarkable man in his short occupancy of public office. Not only did Governor Wilson bring about the enactment of every platform pledge made during his campaign, but he added to that program many reforms, including an act permitting cities to adopt the commission form of government, with a modified form of the initiative, referendum and recall.

Here are a few of the more important measures which New Jersey owes to the splendid courage and practical mind of Governor Wilson:

A comprehensive public utilities law, fixing the responsibility on officers of corporations for all violations, and vesting power in a commission to make rates and physical valuation of public service companies.

Workmen's compensation law, providing for automatic payments for injuries or loss of life, in all industries, and doing away with the old fellow-servant responsibility of the common law.

Corrupt practices act, which makes it impossible for any corporation to contribute in any way towards the election of any candidate, and likewise makes the use of money on election day impossible.

Direct primaries for all elective state, county and municipal offices.

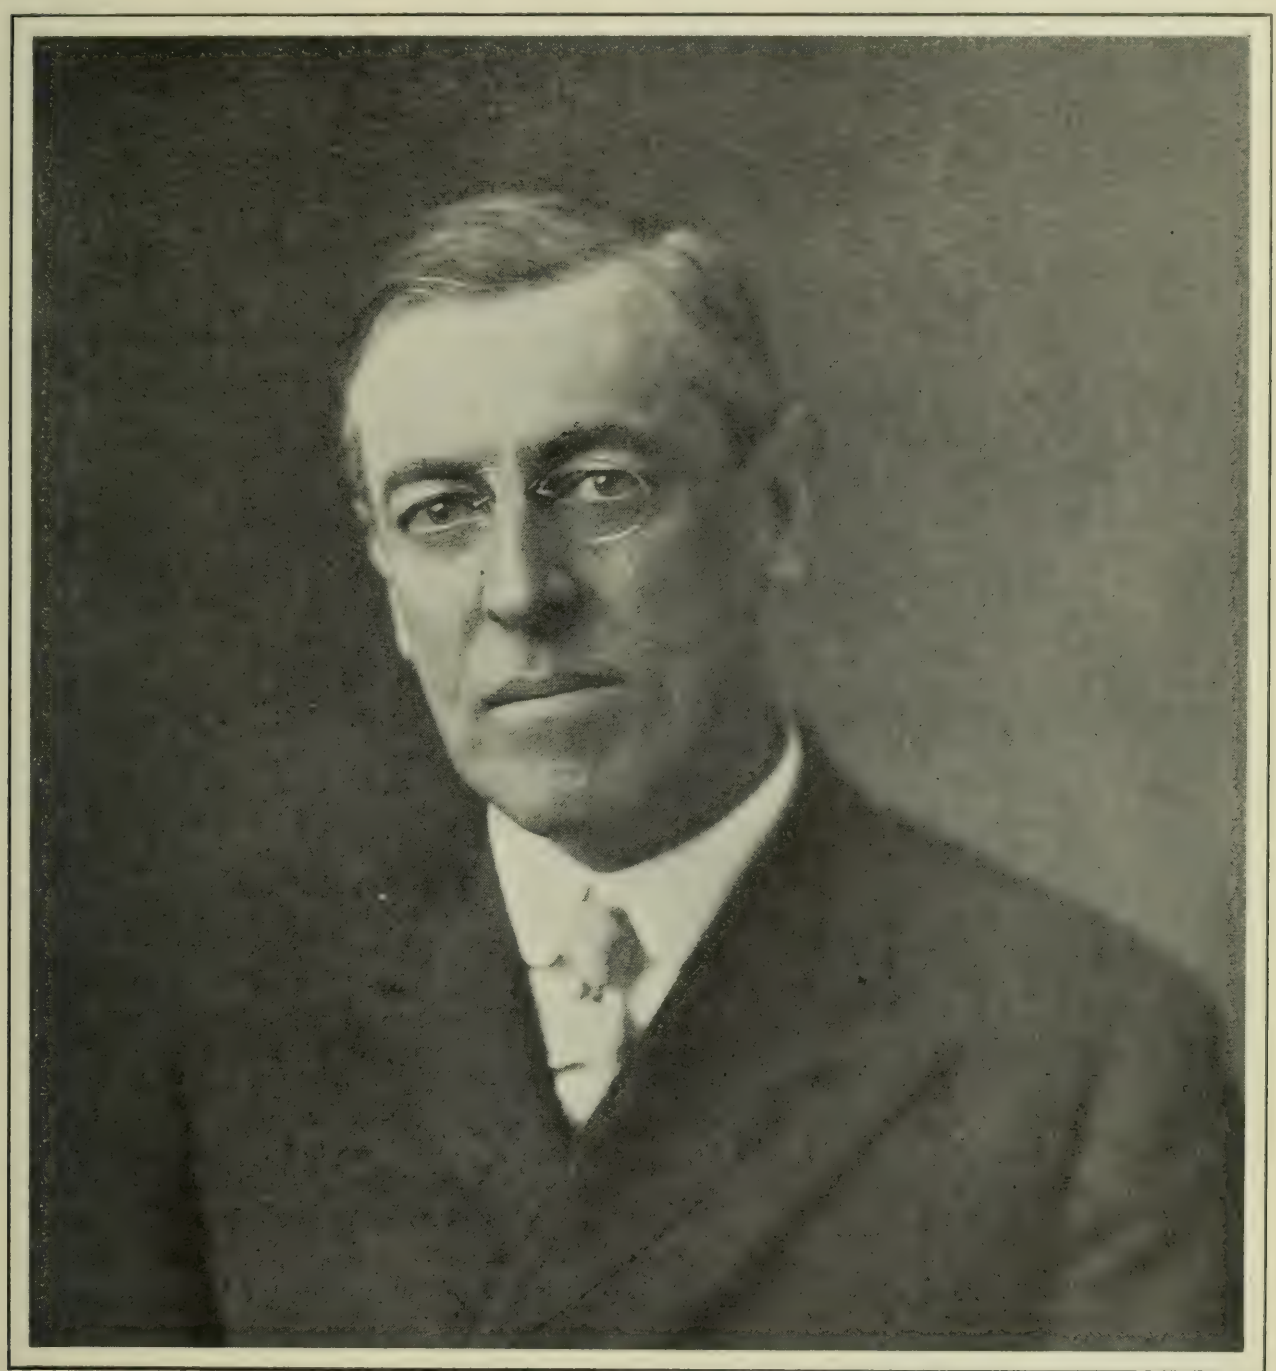
Direct primaries for United States Senator and delegates to national conventions, with popular expression for choice for president.

Civil service tests for election officers and personal registration for all voters.

Non-partisan ballots in both primaries and elections.

Complete reorganization of the complicated state school system, whereby politics will be entirely eliminated.

Purchase of the right of way for a ship canal across the State.



Regulation of cold storage.

Commission government for cities.

Thru the mighty struggle that led up to the enactment into law of this pro-

gram, Governor Wilson kept at all times in the most excellent temper, unruffled by the activity of the machine bosses of both parties who hung about the Capitol endeavoring to block his efforts. And when it was all over he calmly declared that "New Jersey is happy in having

Singularly enough the sources from which Governor Wilson received his greatest encouragement and support during his telling legislative fight had been mostly arrayed against him at the time of his nomination. His nomination was brought about by the most practical of

GOVERNOR WOODROW WILSON.

turned her face to the light and set out upon the path of modern progress with a stride that will certainly carry her forward very rapidly to a place alongside the leading progressive States of the Union."

machine politicians, and it was because of the type of men who were forcing his selection that the progressive Democrats of the State balked. They did not know Woodrow Wilson. But they did know the bosses who stood sponsor for him,

and they very much feared the outcome. While New Jersey had had genuine spasms of moral reform, such as the uprising in 1894, when the racetracks were wiped out, the State had never shown a disposition seriously to throw off the corporation yoke. In the early days, the railroad crowd completely dominated both political parties, and later the other big corporations joined hands and helped support the machines. It made no particular difference whether the Democrats or Republicans controlled, the corporations were never molested. The last Democratic Governor, before Wilson, attempted to foist the most reprehensible railroad lobbyist about the Legislature into a State office; but it proved too much even for the then servile Senate, and the nomination was rejected. Nothing daunted by this, the new Republican Governor named the chief lobbyist for the Pennsylvania Railroad Company as State Commissioner of Banking and Insurance, and the nomination was confirmed. This is but a type of what went on.

And so, when the same old corporation machine undertook to pick Woodrow Wilson as the Democratic nominee last fall, there was a very vigorous revolt. The spirit of political independence that had been spreading over the West had taken sufficient hold in New Jersey to cause the people to want a say about matters, but the machine crowd won and the Princeton president was nominated. Then came Wilson's whirlwind campaign, in the midst of which George L. Record, a Progressive Republican, who had been bitterly combatting the evil forces in his own party, sent an open letter to the candidate. Among other queries put to Dr. Wilson was one as to whether there was any difference between the Republican bosses and the Democratic bosses. To this Wilson replied that one difference was that the Democratic bosses were out of office, and added with much emphasis, "And they will stay out, if I have anything to say about it." He made such a brilliant and convincing campaign that he received a total vote of 283,682 as against the vote of 182,522 given the Democratic candidate for President by New Jersey two years earlier. His was the handsomest vote ever given by Jerseymen to a candidate for Governor.

The bosses who had selfishly nominated him for Governor scoffed at the idea that he had meant what he said during the campaign; but from the day of his election to the present time they have been made to realize, most painfully, that he was in deadly earnest. He had not asked for the nomination. On the contrary, the bosses had sent their emissaries to him with the message that the New Jersey Democracy was so frayed at the heels that it could never hope to recover save by the appearance in the breach of some such strong character as himself. Finally he consented to accept, but not until he had specifically asked the machine agents as to whether, in the event of the Legislature being Democratic, former United States Senator James Smith, Jr., the recognized party dictator of the State, would again be a candidate for senatorial honors. Smith was one of the trio denounced by Grover Cleveland for the "perfidy and dishonor" of disrupting the Democratic party in 1893, and he was blamed by the Democrats of the State for being responsible for the subsequent seventeen years of disaster that had been visited upon the party. The emissaries assured Dr. Wilson that Smith would not be a candidate; but when, in November, the discovery was made that the Legislature had gone Democratic on joint ballot, Smith quickly announced a change of mind and declared himself a candidate. He visited the Governor-elect at the latter's Princeton home, and was gently but firmly told that he had better stand by his first decision. Smith looked upon the new Governor as a political novice, and declined to heed the advice.

Now the Democrats, at the primary in September, had exprest a choice for Senator in the person of James E. Martine, a radical, but perfectly honest man. It was a rather imperfect method of making the party choice known, but inasmuch as 75 per cent. of those who did express themselves voted for Martine, Governor Wilson took the position that the will of the voters thus exprest should be respected. Then began the fiercest battle royal that has been witnessed in New Jersey politics. Smith, in command

of the machine forces of both parties, set out to checkmate Wilson. The fight continued right up to the last minute, and during its progress Smith had prepared by expert writers a number of the most vituperative attacks upon the Governor-elect. But when the roll was called Martine proved the winner, and this remarkable victory sounded the death-knell of bossism in New Jersey. Later, when he was urging his election reforms, one of the machine men remarked cynically: "The author of this bill would wreck the organization that nominated him." Without hesitation Governor Wilson replied:

"It is true that the organization nominated me, but fortunately it was the people who elected me. Does the gentleman charge that this bill attacks the interests of the people?"

At another time Governor Wilson said:

"We still revere 'representative government,' but we are forced to admit, when we scrutinize it closely, that by one means or another, the governments we actually have, have been deprived of their representative character. They do not represent us. They are filtered too fine thru the sieve of secret caucuses and other machine processes; there are too many conventions preceded by too many private conferences between us and the persons thru whom we legislate and conduct our governments. . . . We are cutting away anomalies, not institutions. We are cutting away the jungle and letting in the pure air and light—not destroying the wholesome or creating waste places where there was wholesome growth."

Governor Wilson does not attempt to straddle or sidestep any of the delicate issues. He frankly tells the local optionists that he is favorable to giving the people the widest possible local government, but he does not want local option dragged in as a political issue when it beclouds and possibly blocks what he regards as more important public issues. He takes no stock in laws providing for fines for corporation offenders. "I am not," he says "in the least interested in fining corporations. I am very much interested in jailing the gentlemen who misguide corporations."

It is the view of Governor Wilson that it does not require any particular courage to do the things that he has been doing so strenuously in New Jersey. He declares:

"I have heard it said that it required courage to stand fast for the right. As I conceive it, it would require courage to do anything else. It would require courage to turn away from the shining path and plunge again into the darkness. Do you suppose that it requires courage when you have once seen the light to follow it?"

While Governor Wilson is highly gratified at the work that was accomplished by the Legislature, he does not mean to rest on his oars by any means. He expects to get down to a very practical study of all the departments of State government and use the pruning-knife with great liberality. He declares:

"Much remains to be done in the way of effecting such reorganization of the state government as may result in increasing economy and efficiency, and many reforms of consequence remain to be prosecuted and put upon the statute books."

But, with some pride, he feels that no single Legislature could possibly be expected to accomplish more than the one just ended in New Jersey. He says:

"I think it will always be remembered as extraordinary in this, that it witnessed the fulfillment by the Legislature of every important campaign pledge. It has acted not only with unusual diligence and sobriety, but with singular absence of party feeling and party contest. It has had about it the freedom which characterizes men who are acting in the public interest and without regard for private connections or personal interest.

"The employers' liability and workingmen's compensation act has given the State a statute more serviceable and more consistent with justice in the field to which it applies than perhaps any other in the Union. The primary and election bill has worked thoro-going reform of the whole electoral procedure of the State, and has put every process of choice directly in the hands of the people. The corrupt practices act will do, perhaps, more than any other piece of legislation on this notable list, to purify elections and secure unbiased action of the people at the polls.

"The public utilities act goes the full length of reform in respect of the control of public service corporations. It is a thoroly business-like act, well conceived and well constructed and ought to afford a means of settling some of the most perplexing questions connected with the control of corporations. And when to this list is added the commission government for cities, the regulation of cold storage, the substitution of indeterminate sentences for criminal offenses, the rectification of the abuses in connection with false weights and measures and the administration reform of the school system, it must be admitted to constitute one of the most remarkable records of legislation, I venture to think, that has ever distinguished a single lawmaking session in this country."

TRENTON, N. J.

A Message to the North

BY CHESTER T. CROWELL

[Mr. Crowell was born and bred in Texas. He has never, we believe, been above the northern border of the State.—Editor.]

So many solutions of the race problem are suggested, usually by persons who have never lived in the South, that it is remarkable mere accident has not discovered the fact that the South is striving most effectively to solve the race problem by developing in the negro race pride. The South is with persistent injustice accused of holding the negro in bondage. As a matter of fact, both by accident and design, the negro in the South is being taught to be a good citizen without forgetting he is a negro. In other words, he must "stay in his place." Now, this doesn't mean he must do nothing but pick cotton, sweep floors and shine shoes. The imperative demand for men solves the industrial question, and public free schools, which cost the white people of the South millions of dollars annually, solve the educational question.

In return the Southern white man asks the negro not to become offensively familiar with white men. Thousands of negroes in the South are wealthy farmers. A few acquire wealth in the cities. The progress they have made delights the Southern white man and inspires him to greater efforts in their behalf, because primarily the South needs producers, and that is just what an ignorant, lazy negro is not. Regardless of what the Southern white man would do otherwise, it is to his pecuniary interest to help the black man. But he does it with a proper neighborly spirit.

As long as a negro in the South will be orderly, honest and industrious there is no material comfort out of his reach. But he may not own a house among white men; he must not pay attentions to white women; in other words, the shotgun bids him do just what Booker T. Washington and other educated negroes plead with negroes to do, be a negro. Why should he try to be anything else? Nature made him a negro. He has proved that he can be an educated negro, a brave negro, an honest negro, a wealthy negro—well, let him do so.

The race problem is not industrial. Booker T. Washington tells the negroes to educate themselves and be industrious and they will be well regarded by white men. So they will; but they will not be taken into the families of white men. They listen to Booker T. Washington and hope too far. This negro problem is essentially a race problem. When you ask me why I do not associate with a negro I do not say it is because the negro is poor and dirty and ragged and uneducated. I and all the white men I know and all I want to know object to a negro because he has a black face and other physical characteristics of the race. This is absolutely basic if you will consider it a moment. The change in me to fit me to like the company of a negro would call for the elimination of the optic and olfactory nerves. By this no thoughtless insult is implied. The yellow man discovers about the white man a certain distinctive odor that is displeasing. The racial barrier is too great to be overcome.

Negroes enjoy the friendship of every Southern white man. They may use his lands and goods and money and influence, but they cannot be his companions. That is because a black face with a flat nose is displeasing to a white man before he consults his opinions on the race question or anything else.

Now, the negroes can be happy among themselves. Happiness is always found within. They are children. They seek it among the white people from whom they are learning. It is natural. They must get over this error. The Southern man, with his public school and his lynch law, is helping to cure the error. The Northern man and sociologists with sentimentality justify the negro in doing the very things which militate against his good and the good of the white race.

All other races and nationalities have their clannish pride. Scoff at Chinese

or Japanese because they are yellow and they will laugh. Let any color of the spectrum scoff at the white man because he is white and he laughs. But call a black man a negro and nine times out of ten his feelings are sorely lacerated. This so-called abuse of the negro is designed to produce a black man who will be satisfied with his color and go about his work without considering the goal of all ambition, race amalgamation. He must marry a woman of his race, tho he have fifty millions of dollars. On the intermarriage of the races, W. E. Burghardt Du Bois presents, in a recent issue of THE INDEPENDENT, a proposition on this subject which, as reasoning and from the standpoint of the negro, is clear enough, but which doesn't apply to the conditions.

"I believe," he says, "that a grown man of sound body and mind has a right to marry any sane, healthy woman of marriageable age who wishes to marry him."

Abstractly, so do I. But no white woman of the South that I ever heard of wanted to marry a negro. That is where the negro is most numerous. Why don't they want to marry them? About one white woman out of a few million will marry or cohabit with a negro. Even when virtue cannot be boasted it is considered yet possible to drop lower by overlooking a race distinction.

W. E. Burghardt Du Bois thinks laws to prevent intermarriage are wicked. He speaks of prevention of race amalgamation. There is no danger of race amalgamation. There never has been. The negroes have been here since 1586. No laws nor force upon the face of the earth will prevent race amalgamation where even a minority of the two races desire it. But there is eminent danger that a few white men and negro women will produce a few children of such complexion that they will, innocently or otherwise, pose for white until a reversion to type in their children brings murder, suicide, orphans, feuds and race riots. There is the principal basis for the miscegenation laws in force in every Southern State. And they are as truly democratic in the opinion of millions of Southern men and women as any other laws on the statute books. A vast majority opposes race amalgamation. A small and almost invariably vicious minority does not. Let the negro be a negro. We of the South will educate him, let him own his own land, vote when he knows what he is doing, buy and sell with him, sit on the jury with him, give him more than a fair trial, even temper justice with mercy, because he is weak—we will do all this cheerfully and applaud his successes. But if ever he wants to kill a white man, sit at table with a white man, live in the same neighborhood or look at our daughters, he is going to get shot, or hanged, or burned at the stake, or all three. This whole race question hinges upon whether or not the negro can develop race pride. Men like Booker T. Washington and a few others help by furnishing them heroes. Even Jack Johnson perhaps helps. But every time race amalgamation is discussed in the North it causes funerals among Southern negroes.

The industrial feature of the problem enters into it more prominently now than in former years. Increasing wealth and education of the negroes brings them into closer contact with whites, but makes them no more acceptable after business hours. For the greater part, that education which brings them closer to the white man teaches them how to behave. These industrial conditions also increase the number of lynchings. The North doesn't seem to realize it, but we of the South are no more "lawless" now than ever before. We merely have more offensive negroes, tho the proportion is by no means alarming. On the whole, the outlook is very bright. It has always occurred to me that the North thinks them particularly disgraceful because old and young, high and low, lawyer, banker and messenger boy take part. I remember not long ago reading a sarcastic editorial in the Washington *Herald* on "A Polite Lynching." The lynching in question was handled quietly. The mob assured itself of the guilt of the negro. Quietly they hanged him and dispersed. There was no promiscuous disorder. It was "an orderly lynching." One reason for the lynching which is now a firmly established institution (endorsed by even a portion of

the press) is that justice is delayed. Criminal dockets all over this country are heavy. Trials are slow, and by raising a question about white men composing the jury or some similar question, the case can be delayed by an appeal to the Supreme Court of the United States. You of the North do not know how all the ceremony of a trial appeals to an ignorant negro. It makes him feel like a martyr. He actually gets his picture in the paper and the judge talks to him and a white lawyer represents him. He frequently makes a speech from the gallows, and by the time it is all over a lot of negroes think it is "real smart" to go thru all that. Punishment must be drastic, painful and summary, and the idea of disgrace must be conveyed if punishment is to be effective. We are trying to make trials more rapid, but every one knows that is a national and not a sectional problem. We are doing our part.

Immigration comes to the South from the North and is coming rapidly. But these men see the situation as the South sees it. Does it not occur to you that when several millions of persons agree about a matter, there must be some basis for their conclusions? The North and East are too sophisticated. They think they possess all the broadmindedness. When the Pacific Coast had to deal with the yellow race, the South, without knowing the conditions, took it for granted the Pacific Coast people have sufficient common sense to deal intelligently with their own problem. But it appears the South cannot be granted the benefit of the same assumption. At least, however, we can work out our own problem, tho it requires fracture of the organic law, and we are proceeding along that line.

No problem upon the face of the earth is more serious than a race problem. When they stand in the way of its solution, constitutions, laws, governors, militia and courts look like tinsel and gaudy tissue paper. The South is determined to solve this race problem. It must, for its own preservation. It is trying the most human, economic sensible plan—education with a view to the development of race pride. In each instance where it fails there is resort to arms, and all the platitudes under the sun cannot make it otherwise.

The charge is frequently made against the South that it places obstacles in the way of the negro who wishes to vote. The South is guilty. It does that persistently, and the practice is even more popular in the South at present than ever before. Northern critics often make the South laugh by the very gentleness of their criticism of the methods employed in the South. There are places where Southern men think it not amiss to use the shotgun to prevent negroes from voting. The poll tax and grandfather clauses are about the most gentle methods employed.

Under the law a negro has a right to vote. It is a strange situation. The South has quite a bit of trouble getting used to it. The negro who votes has supplanted Uncle Remus and Black Mammy. Those good old creatures who served so loyally are among the most cherished traditions of the Southland. No Southern man ever talks about his old black mammy without tears coming into his eyes. She and "her man" used to sit on the old pine board in the back yard, and, swaying back and forth in the fading evening sunlight, croon their weird songs and tell wonderful tales about Br'er Rabbit. God bless the good old creatures. They live in the literature of the South and in the heart of every Southerner.

They were snatched from all this by the Fourteenth and Fifteenth Amendments to the Constitution of the United States. In all the long history of the world the United States stands out unique as the only nation which ever raised its slaves to the full rights of citizenship without even the desire for such rights having been exprest by the slaves. No blood flowed from their veins that they might vote. It came to them more like the stroke of lightning than a blessing.

About one-ninth of the population of this country is black. This population is confined principally to the Southern States. In some of these States the blacks outnumber the whites. In some parts of every Southern State the blacks outnumber the whites. These black men

are not particularly fond of voting. They do not understand democratic institutions. The majority of black men, in the opinion of Southern men—and Southern men know them best—are not sufficiently intelligent to vote. If they were there would be no objection to their voting. There always will be an objection on the part of Southern white men to negroes holding office, because that lifts them to a position superior to the white man. It is there the race question enters. Quite recently, in Anderson County, Tex., a few negro road supervisors were appointed in negro neighborhoods. The negroes ordered some white men in that neighborhood to work on the roads under them. It seems the negroes became unduly elated with their petty authority. It precipitated a race riot in which nineteen negroes were killed. It is not yet possible for negroes to hold office. In all probability it never will be in the South. No harm results, because the negroes are inefficient.

Now, if all the negroes could vote they would probably elect negro officers. As it is, their votes when cast, are principally venal. The venal voter is the most dangerous element in American politics. The South is trying to reduce venality by reducing the negro vote. In Southern cities negroes pay their poll taxes and vote. They are in the minority and it does not matter. They are influenced, coerced, intimidated or bought, for the most part. In the smaller communities the poll tax eliminates thousands of them. Where this is not done they are usually intimidated.

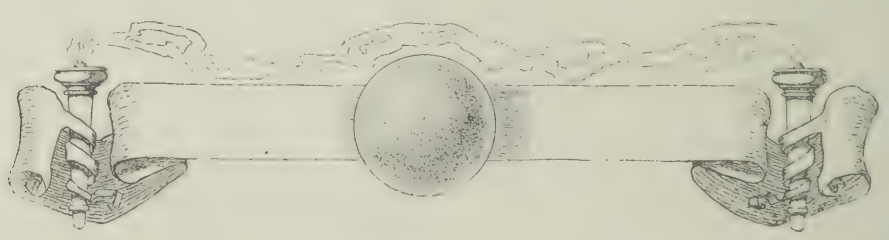
The white men do not like to do this. It is not a pleasant task. It has been forced upon them against their will. They did not bring the problem upon themselves. They are educating the negro and insisting upon his being a good workman. When a negro conforms to these demands he enjoys the good will of all white men in the South It even goes to the point where the best evidence a negro on trial in the South can present is the fact that he is a good workman, honest, faithful, sober and steady. This proof has acquitted many a black farm hand. Only recently the negro woman who is cook for one of my neighbors had a dispute with her husband, during the course of which she cut him dangerously with a razor. The evidence showed he does not work and that she is a good cook and a reliable domestic. She was acquitted. The details of the fight had nothing to do with it. This is what the South considers "substantial justice."

But the other parts of the nation may be assured the Southern negro will have difficulty in voting until he is deemed worthy of the privilege.

In the little town of Richmond, Tex., where negroes are numerous, there is an institution known as the "Jayhawkers Democratic Club." Shortly before the Democratic primaries are held this club has a meeting in the town hall. All the candidates and all the white voters of the county attend. These men are hotheaded and they know it. They frequently fight among themselves. Therefore they bring their wives and children, because they know there will be no shooting while the women are present. The candidates make their speeches. The voters cast their ballots and candidates are elected. These same candidates are elected in the Democratic primaries and in the November elections. It is made difficult for negroes to vote in these elections. They seldom try, any way. They are not interested. In this manner good men are kept in office. This is the only manner in which that difficult task can be accomplished under such distressing conditions. To me this indicates a faithfulness to democratic institutions which is nothing less than marvelous. To the Northern man it no doubt seems unjust. But if the negroes were encouraged to vote it would mean offices could be bought. To the Northern men who come to Southern States by the thousand it doesn't seem unjust. They find the new conditions make a difference. They adjust themselves and their views to the changed conditions. If they didn't there would be parts of the South today where negroes would be casting a majority of the votes. What the results would be may be left to conjecture.

The problem of the negro voter in the South is serious. When he appeared first, and under the Northern "carpetbagger" was victorious, it brought about

the Ku Klux Klan, whose deeds of violence form one of the bloody pages in the history of this country. But the white man is in the ascendency, and he works with stratagem rather than arms to the greatest possible extent, because he realizes peace is valuable. He would rather be dead than subject to the orders of a negro official, and he cannot change himself. That is a race prejudice that is basic. It can no more be eliminated than seeds can be prevented by argument from sprouting in the spring time.



But it is possible for the two races to live side by side with a small amount of friction. That is the end toward which the Southern man is working. That he has accomplished his task in spite of being in the minority in many places he considers to his credit. In some places the difficulty of preventing the ignorant negroes from casting venal ballots has been so great that it is thought best the negro should for a few more years be deprived by law of the ballot. This opinion was strong enough in Texas for the last Legislature to pass a resolution calling upon the Senators and Representatives of Texas to exert their strength in the House and Senate for modification of the Fourteenth and repeal of the Fifteenth Amendments, "to the end that the right of the ballot be taken from the negro race, but all other rights of life and property be reserved and guaranteed to that race."

As an apt illustration of the class of voters kept away from the polls by the stratagem of Southern white men, an instance from rural Georgia may be cited. In a certain neighborhood the negroes had previously been warned as usual to remain away from the polls. Most of them willingly remained away. But it was understood quite a number would vote. A party of men went forth at night in a wagon, armed with a drum made of a sheep skin and half a beer keg. Beating upon this made a sound very much like that of the Aztec war drum. It is weird and awful. The negroes were thoroly frightened. White men then went about informing them that a terrible animal had escaped from a circus menagerie and that it would be wise for them to remain indoors all the next day. The negroes remained indoors. What kind of votes would be cast by men so easily frightened?

In the recent Congressional election there was a notable division of the negro vote where negroes are permitted to vote. This is most encouraging. When the others who do not vote attain this degree of intelligence or a degree of intelligence which offers hope for the near future, they, too, will be welcome to vote. By this division of the vote the negro makes himself first a voter and secondarily a negro. When the black vote is cast solidly it forces upon the attention of the white man that the negro is primarily a negro and accidentally a voter.

The South feels it shows great forbearance in dealing thus gently with the descendants of its former slaves who have been cast accidentally upon the body politic as voters. If some better method to solve the question can be devised the South would be pleased to use it. In the meantime, the person who advises permitting access to the ballot box regardless not of color, but of intelligence, speaks to no purpose. There are enough ignorant and venal white voters. They would be ruled out were it possible. The South does not purpose to permit the load to become heavier than democracy can bear.

San Antonio, Texas.

A League of Peace

BY HAMILTON HOLT

[The article which follows is the substance of the address made by Mr. Holt as president of the Third National Peace Congress held last week in Baltimore. For a discussion of the work of the Congress the reader is referred to our editorial pages.—EDITOR.]

THE first National Peace Congress of the United States was held in New York City from April 14 to 17, 1907—just two months before the convening of the Second Hague Conference. In the personnel of its officers, speakers and delegates, it was the most distinguished unofficial gathering ever held in the United States.

As was to be expected, the main attention of the Congress was focused on the coming Hague Conference. Nearly all the speakers discussed it, and the two most important resolutions passed were those favoring the negotiation of a general treaty of arbitration and the turning of the Hague Conference into a permanent international body.

The Hague Conference, thanks in large measure to the leadership of the United States delegation, took a long step toward making these two propositions realities. The principle of obligatory arbitration was unanimously adopted by all the nations, and had not Germany and Austria and a few of the smaller European states objected strenuously a general treaty in accordance with that principle would have been drafted and approved.

The nations also took the first step toward turning the Hague Conference into an automatic and periodic world congress, by taking the third conference out of the hands of Russia and putting it in charge of an international preliminary committee which was to meet about 1913 and determine its method of organization and program.

When the Second National Peace Congress of the United States was convened in Chicago exactly two years ago this very day and hour, the Second Hague Conference had already passed into history and the world was just beginning to realize what a great work it had accomplished for international justice and peace. As Elihu Root has so truly said, that conference "presents the greatest advance ever made at a single time toward the reasonable and peaceful regulation of international conduct, unless it be the advance made at the Hague Conference of 1899."

The Chicago Congress was not content, however, with passing congratulatory resolutions on things already accomplished. Like the New York Congress it set its face toward the future and spoke out brave and strong. Not only did it declare that war was "out of date" in this age of Hague conferences, courts and arbitration treaties, but it demanded as the most pressing "next steps" in the peace movement the creation of a peace commission by our Government to study the whole peace question, a general treaty of obligatory arbitration, and the establishment of a League of Peace, to make the recurrence of war impossible. Two years have now elapsed since these three recommendations were uttered. Has any progress been made toward their realization?

Last June the Congress of the United States passed unanimously the following joint resolution:

"Resolved, etc., 'That a commission of five members be appointed by the President of the United States to consider the expediency of utilizing existing international agencies for the purpose of limiting the armaments of the nations of the world by international agreement and of constituting the combined navies of the world an international force for the preservation of universal peace, and to consider and report upon any other means to diminish the expenditures of government for military purposes and to lessen the probabilities of war.'"

In his annual message to Congress, dated December 16, 1910, President Taft stated:

"I have not as yet made appointments to the commission because I have invited and am awaiting the expressions of foreign governments as to their willingness to co-operate with us in the appointment of a similar commission or representatives who would meet with our commissions and by joint action seek to make their work effective."

It is impossible to overestimate this epoch-making document and the action of the President upon it. When the President appoints the members of the commission, for the first time in the annals of history a great nation in time of peace will prepare for peace.

It is in the realm of arbitration, however, that the greatest cause for rejoicing exists. The world, to be sure, has not yet obtained the desired general treaty of obligatory arbitration. It has got, however, what is of vastly more importance. President Taft's statement that he is willing to settle all disputes, even those supposed to involve national honor, by arbitration, the most momentous declaration ever made in favor of peace by a man in his position. The proposed arbitration treaty of unlimited scope with Great Britain is the practical application of this declaration. Already it has transfigured the whole peace movement. Eventually it will render the code of war obnoxious if not obsolete. And this is the situation that confronts the world as we assemble here today at the opening of the Third National Peace Congress of the United States. It is our duty to look ahead thru the vista opened up by President Taft's high statesmanship and to take as resolute and progressive a stand here as the New York and Chicago congresses did four and two years ago.

There are many pressing problems before us waiting to be solved. The judicial arbitration court created by the Second Hague Conference, all but the detail of the method of the selection of the judges, is yet to be constituted. No attention has yet been paid to the requests of both the First and the Second Hague Conferences that the governments give themselves over to the serious study of the limitation of armaments. It is not yet provided that the future Hague conferences become automatc, periodic and self-governing bodies, as our delegation suggested at the Conference of 1907. The Peace Commission is not yet appointed. We should consider all these and many other questions where our voice may be of help to governments, and peace societies both here and abroad. But the one all important issue before us is the pending arbitration treaty with Great Britain; for this treaty is destined to make war hereafter impossible between the English-speaking peoples of the earth.

The peace movement, we have now come to realize, is nothing but the process of substituting law for war. The world has already learned to substitute law for war in hamlets, towns, cities, states, and even within the forty-six sovereign civilized nations. But in that international realm over and above each nation in which each nation is equally sovereign, the only way at the present moment for a nation to secure its rights is by the use of force. Force, therefore, or war as it is called when exerted by a nation against another nation—is at present the only legal and final method of settling international differences. The world is now using a Christian code of ethics for individuals, and a pagan code for nations, tho there is no double standard of ethics in the moral world. In other words, the nations are in that state of civilization where without a qualm they claim the right to settle their disputes in a manner which they would actually put their own subjects to death for imitating. Thus the peace problem is nothing but the ways and means of doing *between* the nations what has already been done *within* the nations. International law follows private law. The "United Nations" follow the United States.

At present international law has reached the same state of development that private or municipal law had attained in the tenth century. Furthermore, a careful study of the formation of the thirteen American colonies from separate States into our present compact Union discloses the fact that the nations today are in the same stage of development that the American colonies were at about the time of their first confederation. As the United States came into existence by the establishment of the Articles of Confederation and the Continental Congress, so the "United Nations" at this very moment exists by the fact of the Hague Court and the recurring Hague Conferences: the Hague Court being the promise of the Supreme Court of the World and the Hague Conferences being the prophecy of the Parliament of Man. We may look with confidence therefore to a fu-

ture in which the world will have an established court with jurisdiction over all questions, self-governing conferences with power to legislate on all affairs of common concern, and an executive power of some form to carry out the decrees of both. To deny this is to ignore all the analogies of private law and the whole trend of the world's political history since the Declaration of Independence. As Secretary Knox has said in his great address delivered last June at the commencement of the University of Pennsylvania:

> "We have reached a point when it is evident that the future holds in store a time when war shall cease: when the nations of the world shall realize a federation as real and vital as that now subsisting between the component parts of a single state."

I recall no more far-visioned statement than this ever emanating from the chancellery of a great state. It means nothing less than that the age-long dreams of the poets, the prophets and the philosophers have at last entered the realms of practical statesmanship and that the world is on the threshold of the dawn of universal peace.

The political organization of the world, therefore, is the task of the twentieth century. But the formation of a world government must be a very slow process. Such a federal government when complete would be, as the historian Freeman has said, "the most finished and the most artificial production of political ingenuity." To accomplish it is surely not the work of a day or a year.

How then can this movement be hastened? There are only two ways. First, by the education of the public opinion of the world so as to induce the governments to move at successive Hague conferences or at special international conferences, and, second, by a few of the more enlightened nations organizing themselves together for peace in advance of the others. This latter method is already being adopted extensively. The Judicial Arbitration Court will be constituted by only a few of the nations at first. England and the United States will not wait for a general treaty of obligatory arbitration before establishing a model one between themselves. Chile and Argentina did not delay for concurrent action on the part of the whole world before they commenced to disarm, as the statue of the Christ on the summit of the Andes so eloquently attests. Why, then, should not a few nations here and now form among themselves a League of Peace to hasten the ultimate world federation?

The idea of a League of Peace is not novel. All federal governments and confederations of governments, both ancient and modern, are essentially leagues of peace, even tho they may have functions to perform which often lead directly to war.

The ancient Achaian League of Greece, the Confederation of Swiss Cantons, the United Provinces of the Netherlands, and the United States of America are the most perfect systems of federated government known to history. Less perfect, but none the less interesting to students of government, are the Latin League of thirty cities, the Hanseatic League, and in modern times the German Confederation. Even the Dual and Triple Alliances and the Concert of Europe might be called more or less inchoate leagues of peace.

Any league of peace, however, likely to be established in the immediate future must differ from all previous and present leagues, alliances and confederations in total abstinence from the use of force. The ancient leagues as well as the modern confederations have generally been unions of offense and defense. They stood ready, if they did not actually propose, to use their common forces to compel outside states to obey their will. Thus they were as frequently leagues of oppression as leagues of peace.

The problem of the League of Peace is therefore the problem of the use of force. Shall the members of the League "not only keep the peace themselves but prevent by force, if necessary, its being broken by others," outside of the League, as ex-President Roosevelt has suggested? Or shall its force be exercised only within its membership and thus be on the side of law and order and never on the side of arbitrary will or tyranny? Or, rather, shall it never use force at all? Whichever of these three possibilities is ultimately adopted, I think that at first it would be unwise for a League of Peace to attempt to use force for any purpose

whatsoever. Besides, the use of force will probably be found unnecessary. When nations arrive at that state of civilization in which they are ready to settle their differences by arbitration rather than by war, they are ready peaceably to abide by the decision of arbitral tribunals. The history of arbitration clearly demonstrates this. With but one or two insignificant exceptions, the nations have lived up to all arbitral awards, both in the letter and the spirit of the judgment; and there have been hundreds of such awards. We need a policeman to use force on criminals. But happily there is no such thing nowadays as a criminal nation.

Moreover, to project a League of Peace at the present moment with a specially constituted international force at its disposal would instantly beget suspicion, if not alarm, on the part of all nations not invited to join. They would consider it an alliance against themselves, and would very likely proceed forthwith to start a counter alliance to preserve the balance of power.

With the idea in view, then, that the League of Peace shall not have any specially constituted common army and navy at its disposal, I offer herewith, for whatever they may be worth, the following suggestions for a League of Peace in the hope that they may possibly serve as a basis for further study:

1. The nations in the League shall refer all disputes of whatsoever a nature to arbitration.

2. The Hague Court or other duly constituted Courts shall decide all disputes that cannot be settled by diplomacy.

3. The League shall provide a periodical convention or assembly to make all rules for the League, such rules to become law unless vetoed by a nation within a stated period.

4. Each member of the League shall have the right to arm itself according to its own judgment.

5. Any member of the League shall have the right to withdraw on due notice.

The advantages that a nation would gain in becoming a member of such a league are manifest. The risk of war would be eliminated between the members of the league, and a method would be devised whereby they could develop their common intercourse and interests as far and as fast as they could unanimously agree on ways and means. It is conceivable that such a league might in time reduce tariffs and postal rates and in a thousand other ways promote commerce and comity among its members. Indeed, the possibilities of such a league are almost infinite, even tho it attempts to employ no force whatsoever to compel obedience to its will.

Assuming, then, the desirability of such a League of Peace, how is it to be brought about?

Surely the first step is to conclude the arbitration treaty now being negotiated with Great Britain. Once this treaty is upon the international statute books, and as surely as daylight follows dawn it will be followed by similar treaties with other nations. Japan and France are said to be ready—even anxious—to negotiate similar treaties with us. Indeed, it is by no means impossible that there will be a race between England and Japan on the one hand and France and the United States on the other to see which can conclude the second model arbitration treaty of the world.

Thus the time is likely soon to come when several of the nations, having bound themselves each to each by eternal chains of peace, will be ready to take the next logical step and negotiate a general treaty of arbitration among themselves. This, to all intents and purposes, would constitute a League of Peace. And it would inevitably grow in power and prestige until all the nations of the world entered its concordant and prosperous circle.

Indeed, it might be a stroke of statesmanship if an article were added to the proposed arbitration treaty between Great Britain and the United States inviting other nations to adhere to it. This would save much time and effort and obviate the necessity for each of the forty-six nations to negotiate a special treaty with every other. Thus only one treaty would have to be negotiated instead of 1,034. But whether Great Britain and the United States ask other nations to adhere to their model treaty or not, the principle of unlimited arbitration will grow—first by a few nations adopting it, then by more, until finally the whole world will agree to enthrone reason rather than might as the arbiter of their destinies, and war shall reign no more.

First, an unlimited arbitration treaty between Great Britain and the United States. Second, a League of Peace. Third, the Federation of the World.

Is all this a dream? I have already quoted the weighty words of Secretary Knox prophesying the eventual coming of a world state. Let me close with the equally prophetic utterance of an equally responsible and distinguished statesman. On March 17 last, at the dinner of the International Arbitration League, the Right Honorable Sir Edward Grey, the British Secretary of State for Foreign Affairs, said:

"If an arbitration treaty is made between the two great countries on the lines sketched out by the President of the United States, . . . don't let them set narrow bounds to their hopes of the beneficent results which may develop from it in the course of time—results which I think must extend far beyond the two countries originally concerned. The effect on the world at large of the example would be bound to have beneficent consequences. To set a good example is to hope that others of the great powers will follow it, and if they did follow there would eventually be something like a League of Peace."

Efficiency in the Intellectual Life

BY HERBERT N. CASSON

[Mr. Casson is the author of "Organized Self Help," "The Romance of Steel and the Romance of the Reaper," etc. He has lectured and written much on social, economic and business topics, and is now a member of the Emerson Company, Efficiency Engineers. He has often contributed to THE INDEPENDENT.—EDITOR.]

THE new principles of scientific management, which have produced notable improvements in the industrial world, have not as yet been applied to the work of the lawyer, editor, doctor, clergyman, professor or other professional man. Such efficiency experts as Taylor, Emerson and Gantt have shown us how bricks may be laid in one-fifth of the usual time, how a locomotive plant may be geared up to build five engines a week instead of three, or how a gang of shovelers may be so organized as to do easily in three days as much as they had done laboriously in a week. But no body of experts has up to the present time pointed out a more efficient way of reading a book, writing a sermon, preparing a brief, teaching a class or delivering a lecture.

Sooner or later, beyond a doubt, these methods that are being found to be so advantageous in the mill and the machine-shop, will be adapted for use in the study and the office. There is no essential reason why they should apply to belting and not to fountain pens—to machinery and not to a desk. Every man who produces anything is to that extent a manufacturer. He has an output which can be increased and a quality of output which can be improved.

The experiments of efficiency experts show that there is practically no sort of work that cannot be standardized. Any number of processes that were supposed to be unique and hopelessly irregular, have been brought into subjection. Snarls that were believed to be Gordian knots have been raveled out. And in general it is now taken for granted that there is no co-operative work that has not an underlying plan or system of its own.

The starting-point in scientific management is the study and analysis of what is being done. All the various acts and processes are watched and set down and classified, precisely as tho they were bricks or lumber. The expenditure of energy is recorded in the same way as the consumption of coal is recorded. Exactly what each workman does is noted, in the same patient and methodical way that Darwin noted the habits of earthworms or that Herschel noted the movements of the stars. Here is the very essence of scientific management—

to first observe what is taking place and then to eliminate the wastes of energy and the wastes of raw material.

Such observations are called "time-studies." They are made with a stop-watch by a sharp-eyed young man who has been trained to such work. Ten such studies, made of different workmen engaged in the same kind of labor, will give a fairly accurate picture of what is being done. With this picture as a basis, the expert can then proceed to lop and rearrange and co-ordinate, until he has found the very best way in which the work can be performed.

A study such as this can best be made by an outside expert. If it be made by one of the men whose work is being studied, it will invariably omit a great deal of valuable data. The very things that are usual and wholly unnecessary are the things that will be left out. This, in fact, is one of the main reasons for the existence of the professional expert. He, as a skilled outsider, can discover wastes in a factory from his outside point of view, much more successfully than the superintendent of the factory can do.

There is no basic reason, however, to prevent a professional man from making such a time-study of his own work, in the course of an average day. If he can contemplate his actions with a sufficient degree of aloofness, he can put on paper a chart of his day's work. He can find out what his actual schedule is—a discovery that will in most cases prove to be surprising and instructive.

How to use the working hours of the day to best advantage—that is the insistent problem of efficiency. If a lawyer finds, after making a time-study of his average day, that his best thoughts come in the mornings, he can deliberately postpone until afternoon all his correspondence and unimportant interviews. There is no immutable reason why answering letters should be the first task of the day. The most valuable hour should be given to the most important work.

Invariably, in factories, an efficiency expert will find a skilled mechanic doing work which could just as well be done by a laborer; and no doubt a professional man who scrutinizes his own doings will learn that he is spending time where he could more profitably spend money. It is one of the marks of the efficient man that he spends his time doing what he can do best, for the highest possible payment, and employs others to do for him all those smaller tasks that are less difficult and less rewarded.

Just as an efficiency expert, in his study of a factory, takes nothing for granted and challenges every step of the way, so a professional man may do, in a self-imposed examination of his own methods. It may be taken for an axiom that whatever a man does from habit is likely to be done inefficiently. In every habit there is apt to be a survival of traditional clumsiness, perpetuated from generation to generation by thoughtless repetitions. What we see every day we do not notice, and what we do every day we do not think about. We drift. We are pushed hither and thither by the chance happenings of the hour. We have no working-plan of each day, and in so far as we are passive and planless, we are unquestionably inefficient.

According to the new doctrines of scientific management, there is no such thing as unskilled labor. There is a best way to do every kind of work, no matter how simple it may seem to be. There is a right way to sweep a floor, to make a bed, to mow a lawn or to tie a four-in-hand necktie. No act is too small to be done thoughtfully. And no act can possibly be done in the most efficient way until it is put to the test and rigidly examined.

If a train may have a running schedule, why not a factory? This is the question asked by the efficiency expert, and it may not be amiss to carry this question several degrees further and to ask—if a factory can have a schedule, why not an individual? In spite of storms, accidents, sick engineers, careless brakemen and any number of small mishaps, some railroads are now running 98 per cent. of their trains on time. Also, in spite of all the quirks and oddities of factory work, there are now more than 50,000 workmen in the United States who are demonstrating the advantages of scientific management. Therefore, in spite of the variety of a professional man's work and the irregular happenings of

his office, there is no reason why he should not have a schedule which will assist him as a sort of framework and stimulate him as a constant ideal.

Before the efficiency expert came to view most mills and factories were accustomed to measure their own efficiency by certain special efforts—bursts of speed. But the expert pinned them down to the inexorable average. He made superintendents divide the total work of the year by the total number of working days. He pointed out to railroad officials that the average mileage of a freight car is only 25 miles a day and that the average mileage of a locomotive is no more than 82 miles a day. Now, this unpleasant but profitable truth can be applied by an individual just as well as by a railroad. Every man or woman is prone to do this very thing—to estimate personal efficiency by an occasional special feat rather than by a daily average.

To waste half an hour out of every business day is to waste twenty days a year. To work at 50 per cent. efficiency, when 100 per cent. is possible, is to lose half of one's full value to the community. Merely to lose ten minutes out of an eight-hour day is to reduce the day from par to 98 per cent. Such general reflections as these, which are continually applied to mill and factory work, are fully as applicable to individuals.

In the matter of the conservation of energy, too, as well as in the expenditure of it, the principles of scientific management can be applied to individual cases. It is not the purpose of the efficiency expert to make the factory more cruel and military in its methods. On the contrary, it individualizes the workman and gives him a chance to do his best, both for himself and the company. Scientific management does not mean frenzied production. It means the better ordering of the work for the best interests of both labor and capital. Consequently, it provides for recreation as well as for work. It insists that the laborer shall not sag so far down in the course of his day's work that he will not recuperate. No work is profitable in the long run if it destroys the worker, and no energy should be expended that cannot be restored.

In most cases it is not lack of energy that the efficiency expert has to overcome, but *misdirected* energy. Men need not work harder, but to better purpose. If they are drudges, it is not the work that is to blame, but rather their haphazard and traditional methods. In a word, the whole movement toward scientific management, which promises such vast improvements to us as an industrial people, is only another phase of man's determination ultimately to place his civilization upon a thought basis.

Appraisal

BY ANNIE L. CROWELL

THE Potter wrought a certain vase;
No rich design
Of curve or line
Did he upon the surface trace,
That Artisan Divine.

The swift rotation of the wheel,
The thumb's imprint,
The chosen tint—
Yet finished, it may not reveal
Of consequence a hint.

A chalice for the Sacrament?
The very least
At that pure feast,
A flawless beauty should present,
By sacred use increased.

A flask for Oriental balm
Of cost untold?
Or shall it hold
The ruby poppy's drowsy charm?
Or prison liquid gold?

A lovely service shall it find;
Cool waters bring
From mountain spring?
For humble task was it designed,
With meek interpreting?

We futile judge. The Potter knows.
For Him the vase
Has worth and grace;
And with the years a luster grows
That nothing can efface.

AMHERST, MASS.

The Grip of the Gerrymander

BY ROBERT E. ANDREWS

[Mr. Andrews has just spent two years in Washington as secretary to a member of Congress, and has seen in practice how the Gerrymander operates.—EDITOR.]

WHAT are they — these grotesque and fantastic maps that grace this article?—They are nothing more than the silhouets of a few Congressional districts, outlined by State Legislatures of various political complexions to comply with the provision of Federal law that Congressmen "shall be elected by districts composed of contiguous and compact territory and containing as nearly as practicable an equal number of inhabitants." (31 Stat. L. 733-4.) Any single piece of territory is "contiguous," the heading shows how "compact" are some of our Congressional districts, and the following table indicates how nearly equal is the population of those same districts, as numbered:

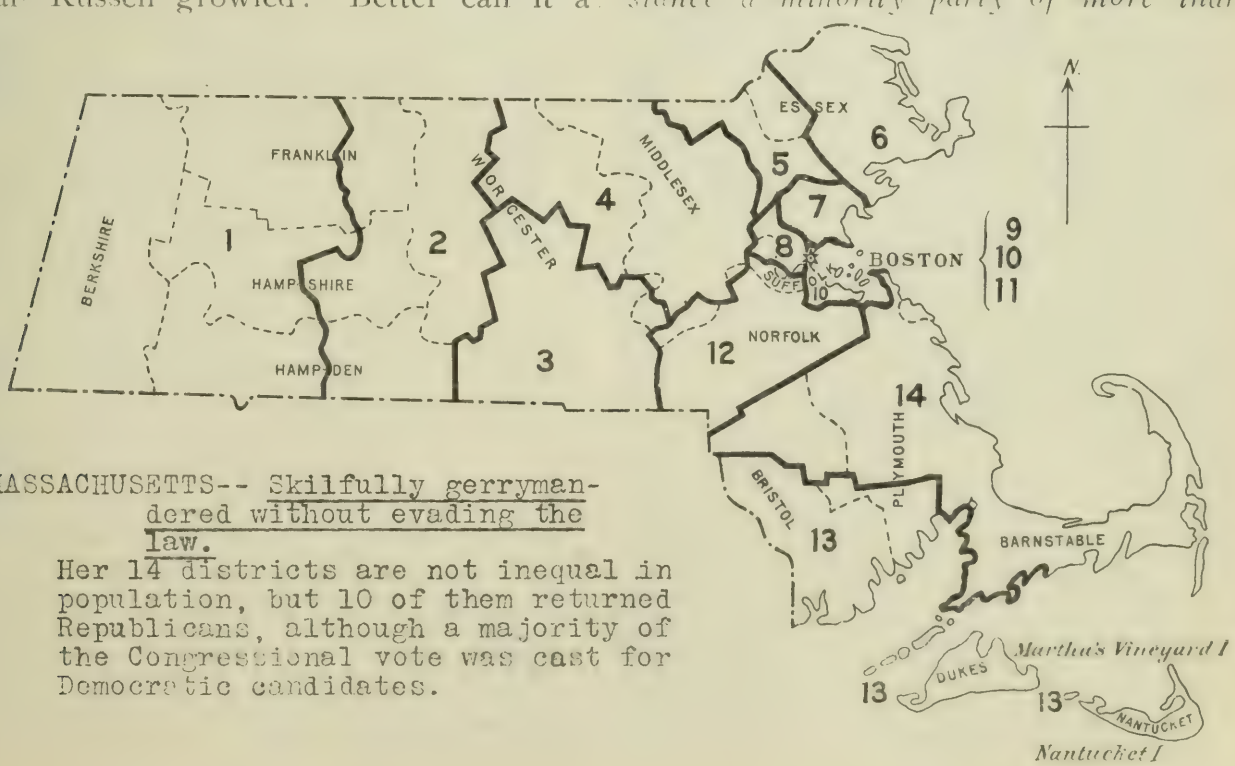
MICHIGAN: A STATE BRAZENLY GERRYMANDERED.

The districts vary in population from 166,124 to 275,525. Are they, in your opinion, "contiguous and compact territory and containing as nearly as practicable an equal number of inhabitants?"

1. Second North Carolina district, population 172,496.
2. Twentieth Ohio district, population 227,000.
3. Twenty-first Pennsylvania district, population 181,899.
4. Sixth Virginia district, population 196,959.
5. Ninth Alabama district, population 213,820.
6. Seventh North Carolina district, population 197,868.
7. Second Tennessee district, population 217,324.
8. Third New York district, population 247,051.
9. Seventh Missouri district, population 218,666.

These curiously shaped constituencies were drafted by the State Legislatures of 1901 and 1902, and the phrase quoted is from the Federal Apportionment Act of 1901, which applied to their creation. The apportionment acts, which since the founding of the Government have followed every decennial census and determined the new allotment of representatives to each State, did not until 1842 provide anything more than a bare statement of the allotment. In the early days the States elected their representatives "at large" — that is, they voted as a whole electorate for the allotted number of Members of Congress. Candidates so elected were naturally all members of the political party which could muster a majority, however small, of the total State vote. The State minority received no representation at Washington.

When, in some of the Eastern States with ten or fifteen Congressmen, this method began to cause well-justified protest, the plan of Congressional districting was introduced, which divided the State into districts, each to elect its own representative. The minority, it was supposed, would thus secure proportionate representation in the State delegation. The State Legislatures took charge of the districting.



The Apportionment Act of 1842 was the first to recognize the justice in the theory of election by districts, and it contained a paragraph prescribing that representatives should be elected from districts composed of "contiguous territory." However, the apportionment

acts based upon the census of 1850 and of 1860 did not continue this provision, altho the practice of districting had become almost universal in the populous States. In 1872 the provision reappeared and added to it was the phrase: "containing as nearly as possible an equal number of inhabitants." Since 1872 each apportionment act has been similar or identical in its districting provision. The Apportionment Act of 1911, passed by the House and now under consideration in the special session, has such a provision reading the same, word for word, as that quoted from the act of 1901. Yet in the next two years State Legislatures will produce another set of hobgoblin districts, neither compact nor as nearly as possible equal in population. The "gerrymander" will flourish.

The gerrymander was christened in 1813, altho it must have been in operation long before that. A staunch old Federalist, Gov. Eldridge Gerry, controlled thru his Legislature the redistricting of Massachusetts under the census of 1810. In the office of Benjamin Russell, an ardent Republican editor, hung a map of the State, as newly subdivided by Gerry and his men. Gilbert Stuart's ready pencil whimsically added to the outlines of a grotesque district the wings and tail of a dragon. "Ha!" he said when he had finished, "How's that for a salamander?" The Republican Russell growled: "Better call it a Gerry-mander." And American politicians have taken his advice.

It is due to the gerrymander that the division of a State into Congressional districts does not result, as it theoretically should, in giving the minority party in each State its due proportion of the delegation. It may be said of gerrymanders, as of their designers—"by their fruit ye shall know them." Virginia, averaging the Presidential election of 1908 and the gubernatorial vote of 1909, is about 62 per cent. Democratic. Yet 90 per cent.; nine out of ten, of her representatives are Democrats. The Republican voters of Virginia, comprising 38 per cent. of her voting population, are represented in Washington by one lone member. The fruit of the Virginia gerrymander was citrous and bitter for the Republicans! Still more striking is Massachusetts' experience in the last election. The vote for Congress showed a Democratic majority of 9,580, yet the delegation for the Sixty-second Congress is ten Republicans and four Democrats. Such examples could be multiplied.

Even more extreme were the results of the Michigan gerrymander following the last apportionment. By her Presidential vote of 1908 Michigan was 62 per cent. Republican; 37 per cent. of her vote was Democratic. Yet in 1908 every one of the twelve Congressmen elected was a Republican. *In this instance a minority party of more than*

MASSACHUSETTS-- Skilfully gerrymandered without evading the law.

Her 14 districts are not inequal in population, but 10 of them returned Republicans, although a majority of the Congressional vote was cast for Democratic candidates.

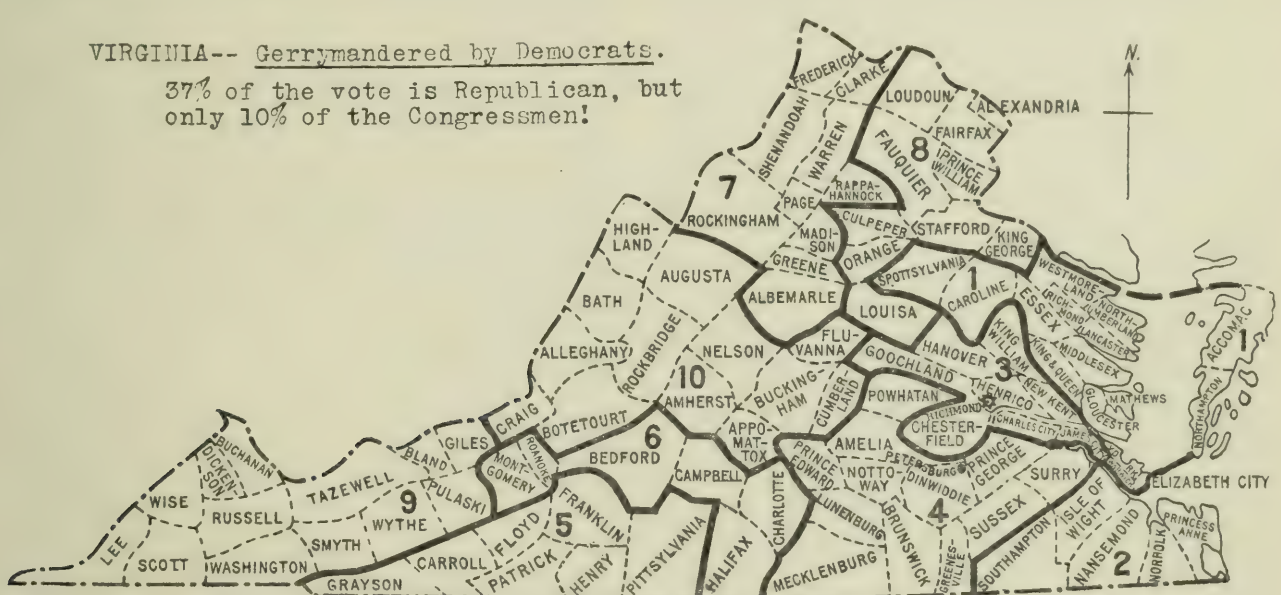
one-third was unable to send a single representative to Washington. As far as the representation of the State minority was concerned the twelve Michigan members of the Sixty-first Congress might as well have been elected at large.

The following table shows just how much the dominant party gains in percentage of total representation simply by virtue of being in the majority and by gerrymandering:

State and votes considered in determining proportion.	Political proportion of vote.		Allotment of Reps.	Members of the 61st Congress.		Representation exceeds vote by
	Rep.	Dem.		Rep.	Dem.	
Virginia— Pres.,'08, and Gov., '09, ave..	37%	62%	10	1 (10%)	9 (90%)	28%
Penn.— Pres.,'08	59%	35%	32	27 (84%)	5 (16%)	25%
Michigan— Pres.,'08, and Gov., '10, ave..	58%	37%	12	12 (100%)	0 (0%)	42%
Mass.— Pres.,'08, Gov., '10, & Cong., '10, ave..	50%	47%	14	10 (71%)	4 (29%)	21%

Percentage of representation of majority party in excess of their percentage of State vote, average, 29%.

This excess of percentage is not entirely due to the manipulation of district lines or gerrymandering. In calculating the proportion of the parties all votes cast are of course considered, but as a matter of fact all votes polled by losing candidates are fruitless and wasted, altho counted in determining the political proportion of the total State vote. Now the majority party, electing a majority of the delegation, naturally claims fewer such votes than the minority, whose excess of wasted votes prevents it, even in a non-gerrymandered State, from securing one-third of the delegation when it polls one-third of the vote. The function of the gerrymander is simply to force the minority to waste a larger part of its vote than would be wasted under natural and impartial conditions of districting.



But who can say that it is more natural and impartial to draw a district boundary in one place than in another? Suppose the State legislature, which is a partisan body with a full knowledge of the political complexion of the various sections of the State, finds a certain section strongly hostile and surrounded by territory in which there is almost no opposition vote. If it lumps all the hostile territory in a single district, that district will return an opposition Congressman. If, on the other hand, it splits up the opposition stronghold, allotting a slice to each of the adjoining districts which can safely carry the burden, it will have prevented that stronghold sending down an unfriendly Congressman. *It will have thrown all that hostile strength into the column of "wasted votes," cast for defeated candidates.* Yet who can claim that there is any obligation to do otherwise, provided the resulting districts are "of compact and contiguous territory"? It was by this method that Michigan Republicans prevented the Democrats from sending down a single Democratic Congressman in 1908.

It may be that the opposition must be granted a district or two. In that sad event the legislature circumscribes the area to be sacrificed so that it will include as few friendly votes as possible, in order that the hostile Congressman may be returned by a triumphant majority and only a few friendly votes be wasted upon a candidate already doomed to defeat. The trail of the gerrymander is marked by many districts carried by small majorities and by a few with glorious majorities. The maxim of the gerrymandering legislature reads as follows: "A Congressman with 150 majority is just as valuable in Washington as one with 6,000—nay, *more* valuable, because he belongs to our party!"

Massachusetts Republicans repeat this with a chuckle when they look over the return of the recent Congressional election. There were 9,580 more people who voted for Democratic candidates for Congress than for Republican in that State. The Democratic party elected four Congressmen; the Republicans, ten. Peters, Democrat, had the largest majority of the State, 5,900; Gardner, Republican, followed with 5,234; Curley, Democrat, was third with 4,562; then came four Republicans. The next man, Murray, Democrat, defeated his chief opponent, also a Democrat, by 1,615, but the combined Democratic vote of these two men over their negligible Republican opponent gave the district the overwhelming Democratic majority of 17,487. The six remaining Congressmen received majorities of less than 1,000, and all but

one of them were Republicans. Note how the big majorities went to the Democrats, meaning a small waste vote cast by Republicans, while the Republicans were mostly elected by small margins, in districts where large blocks of Democratic votes were fruitlessly cast. Needless to say a Republican legislature districted Massachusetts in 1901.

Massachusetts's districts are, however, "of compact and contiguous territory" and approximately equal in population. Hers is the moderate, inevitable gerrymander, unlike, for instance, Michigan's. Michigan legislators had as little regard for the approximately equal population provision of Federal law as they had for

the compactness of their Congressional districts. In 1904, less than three years after the apportionment, the population of Michigan's districts varied from 166,124 in the Ninth to 275,525 in the Twelfth. Discrepancies of size between the constituencies in other States are as glaring.

Thus the provisions of the apportionment act receive scant respect at the hands of State legislatures. The apportionment acts are based upon Article I, Section 4, of the Constitution, which reads:

"The times, places and manner of holding election for Senators and Representatives shall be prescribed in each State by the legislature thereof; but the Congress may at any time by law make or alter such regulations, except as to the place of choosing Senators."

Altho Congress by recurring enactment of apportionment acts prescribing "compact and contiguous territory" and approximately population has exprest an opinion that such supervision is authorized by the Constitution, the apportionment acts are constantly disregarded.

Daniel Webster stated in a report to the Twenty-second Congress:

"Whether the subdivision of the representative power within any State be equal or unequal, or fairly or unfairly made, Congress cannot know and has no authority to inquire. It is enough that the State presents her own representation on the floor of Congress in the mode she chooses to present it. If a State were to give one portion of her territory a Representative for every 25,000 persons, and the rest a Representative only for every 50,000, it would be an act of unjust legislation, doubtless, but it would be wholly beyond redress by any power in Congress because the Constitution has left all this to the State itself."

Subsequent opinions and reports by the House upon this constitutional question do not go as far as Webster, but the agreement is general that Congress cannot interfere in redistricting an individual State. If such was the case the majority in control at Washington could gerrymander all the States, of the same and of the opposing party—something that would not be tolerated for an instant.

It has been shown that the system of gerrymandering, while a unique and interesting development of our representative Government, does not immediately threaten the wreck of the Republic. Its total elimination would change very little the aspect of the House of Representatives, for both parties gerrymander

in whatever States the need and opportunity exists. There would be more Democrats from the North and more Republicans from the South, which would certainly assist in removing sectional feeling between the two sides of the House. A more even justice would be meted out by our representative system could the gerrymander be prevented, but perhaps the greatest evil of its existence is that it flourishes in the face of an existing Federal statute—not an obsolete law, either, but one that will be renewed by Congress in special session. Many people believe that a mistake is made in increasing the House membership from 391 to 433, but more regrettable than this was the fact that every member who voted for that bill knew that a vital part of it would not be enforced. An unenforceable law is as demoralizing an influence in our city, State or National Government as a grain of sand in a delicate machine.

The gerrymander is here to stay until a State Legislature convenes made up of high-minded statesmen who will ignore partisan considerations in redistricting their State. Thomas B. Reed gave an idea of when this consummation may be expected. Said our most epigrammatic of American public men: "A statesman is a politician who is dead."

Thou Rememberest

BY GRACE DUFFIELD GOODWIN

"Thou rememberest that we are dust."
"He remembered that they were wind."

GOD of the Universe, what dost Thou ask
  Of a handful of dust?
Is there no gauging of strength to the task
  When the master is just?
'Neath the terrible wheels we have cried, we have striven
When o'er the King's highway His chariots are driven.
Who, hearing, shall pity? Who, seeing, shall care?
We are dust on the air.

God of the Worlds, dost Thou heed from afar
  When the wind on the sea
Forgot of the wave, and unheard of the star
  Cries, wailing, to Thee?
The black of the midnight enfoldeth alone
The voice of our grieving, the plaint of our moan;
What fiat of destiny framed us to be
Winds lost on the sea?

Great Worker, Great Dreamer, love smote Thee to lean
Down the spaces of splendor that lightened between,
To touch this dull earth till each clod was athrill
And write in its dust the plain word of Thy will.
To breathe in the winds on the dark of the sea
The breath of Thy spirit—a challenge from Thee.
O great the remembrance, and mighty the trust!
Thou knowest, O God, we are wind, we are dust!

Be Sweet, Clever Maid

BY MRS. L. H. HARRIS

[Last week we published an article by "The Bachelor Maid," entitled "Be Clever, Sweet Maid." This week we print a reply by Mrs. Harris, the author of "The Circuit Rider's Wife" and "Eve's Second Husband." Our feminine readers will now have the opportunity of taking the advice of both these experts and applying the net result of it to their own lives.—EDITOR.]

IT is always interesting to note the antagonism of classes. We do not approve, but we are often informed by observing the quality of such antagonism. For example, the intolerance of the cultivated, so-called ethically trained woman toward the duo-decimal goodness of the narrow, conventionally good woman is very suggestive, because it so clearly defines the worst limitation of the trained and educated woman, who has chosen her virtues as she does her college course, who is an eclectic in goodness.

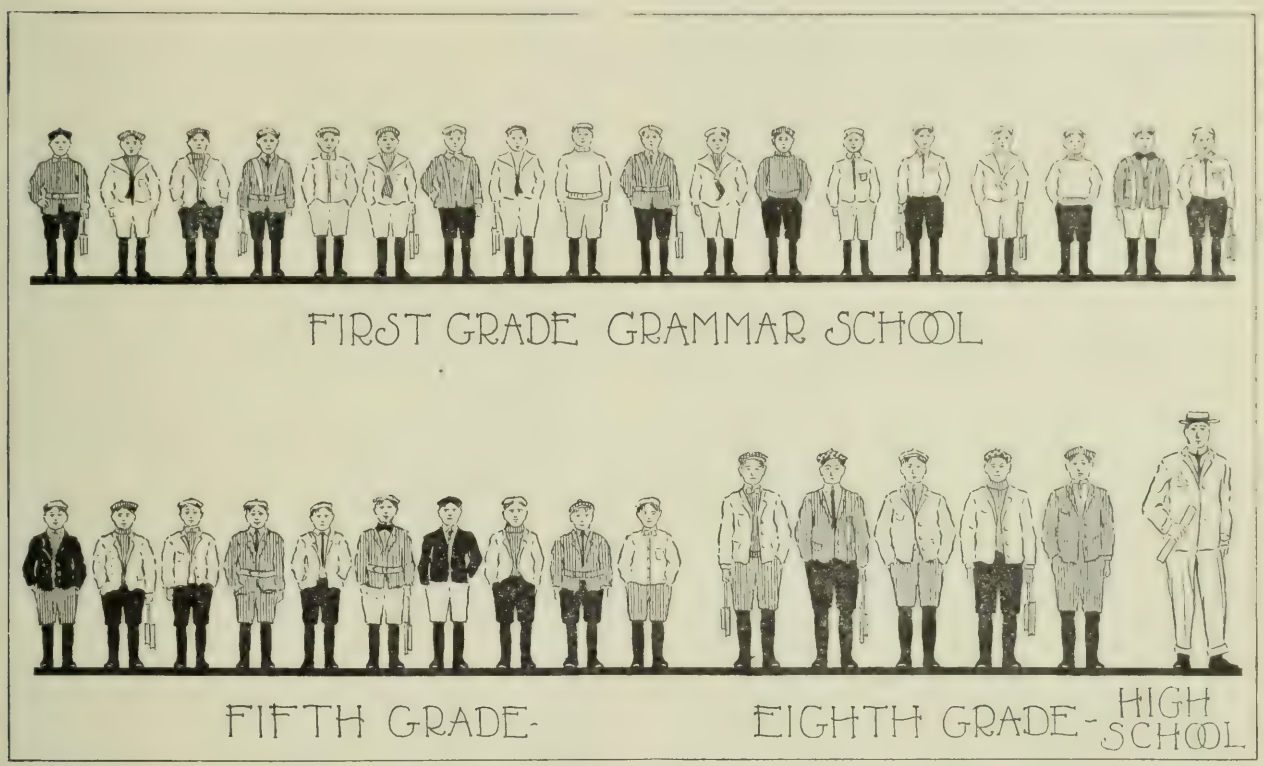
To begin with, she is so apt to put on the whole armor, not of God, but of the vixenish wit of feminine intelligence highly trained for the fray. She is only constructive in theory, not in bearing and bringing things, particularly humans, into the world. She is by the very nature of her training the higher and very versatile critic of men and women not the mother of them. She is the flat feminine shadow of mind that falls across an empty cradle. She is the standard bearer of all the disillusionments, not the sweetly divinely illusioned mother of children. She belongs to that class of women who in spite, or rather because of their intelligence, are really the waste material of the race. They are too cowardly, too intelligently self-protective, to fructify.

There is no doubt, as the Bachelor Maid intimates, that the trained college-bred woman is more ethical, more intelligent in her faith and faithfulness, and that she would really make a better wife and an infinitely better mother. The trouble is, she just won't risk the adventure. She is too meanly, selfishly clever. If she could choose just exactly the man she wants and order of God exactly the kind of children she wants, she would probably condescend to marry oftener. But, not being able to do this, she remains single, sterile, and leaves the great duty of wife and motherhood to narrow, stupid, ill-trained women of the conventionally good type! while she becomes the contemptuous stepmother of their offspring in the public schools. And of course she gets her reward—that of being disillusioned. She does not think this out with all her thinking, that she has to destroy some very dear illusions in order to excuse her own almost vicious relations to society. For this is the truth, a woman who proclaims herself better fitted than any other kind of woman for the duties of family life, who writes so well and so brilliantly to prove her fitness, who, moreover, boasts of her numerous opportunities of marriage, and yet who refuses to enter the state which so much needs her, may be called dangerous to society no matter how much Latin she knows, and no matter how pestiferously chaste she may be. There is such a thing as being pestiferously chaste. It is the kind of quarantined virginity that cannot accept the honor and duties of motherhood, and that deliberately dies in a cloister or some other female profession. The one thing worse than this in a woman is to cast her purity into the street.

It is not enough that there should be no question that they (the great woman-professor type) represented the very best type of womanhood that can possibly be. The question is, did they have the honor and courage and fidelity to propagate after the manner of their particularly fine kind? It seems that they did not. The Bachelor Maid goes on with a naïve gravity that is characteristic of the simpler women whom she appears so heartily to despise, "Had" Fräulein So-and-So and Frau So-and-So "elected to be mothers they would have been as much better mothers than those who boast of being *only* mothers, as their intellectual output was broader, their

wise sympathy deeper." "Elected," mind you. That is the milk in the cocoanut. One never married, and one being married appears, according to the Maid, to have "elected" not to have children. This is why too large a per cent. of the children born are borne by inferior women who do not know much about this kind of election. The children we *ought* to have for the next generation are not born at all because the women who are broad-minded, wisely sympathetic, splendidly capable of rearing them properly, "elect" either not to marry at all, or, being married, not to have children. There is not a corporation in this country that cheats the nation so ruthlessly, or out of so much important material. There is not a set of men in it so conscienceless where they should be conscientious as these same highly cultured, splendidly equipped women who "elect" not to do the only best thing they are fitted to do. For, this is the truth, Nature makes no nuns or eunuchs or just female professors. She designs that every man should beget children that will be an improvement upon what he is, and that every woman shall bear children who will also be an improvement upon what she is. Art, architecture, wealth, learning, all are incidental, and should be so practised as to be merely incidental to this end. One of the prayers of our times should be, "Good Lord deliver us from the feeble and sterile chastity of highly educated females. Good Lord increase their courage, and give them more *moral* sense." For, as the immorality of the present mother-woman consists in narrowness and neglected children, as pointed out by the Bachelor Maid, so the immorality of the class of women which she so foolishly praises consist in refusing even to perform the duties of wifehood and motherhood at all. The latter is the more reprehensible because it results from selfishness and cowardice, while the former results from ignorance in women capable of the greatest courage and self-sacrifice.

The hour approaches when women more than any other part of the race must measure up to new and better standards of honor and responsibility. And when that hour strikes it will be found that the most condemned woman in this world will be the educated woman trained in the sense of responsibility who refused to bear the children that belong to the nation by rights—poor little children stillborn in eternity who can never have the breath of life because of the new cultivated savagery in educated women.



The Bachelor Maid paraphrases the old saying, "Be good, sweet maid, and let who will be clever," into "Be clever, sweet maid, and let who will be good." A still better rendering is, "Be sweet, good maid, and let who can be clever." For it takes more wisdom to be sweet than it does to be clever. And to be sweet is to be engagingly, adorably adjustable. So it is best for women to be sweet at all hazards. We have seen that the merely conventionally good fail. The Bachelor Maid is to be congratulated upon the clearness with which she proves this. And we shall see that the clever woman is also a failure. The Maid is an illustration of this—the crime of being too clever to share her part of the great burden and the great responsibility of being a woman. But no one ever knew or heard of a sweet woman being a failure. She cannot do so much, but she can *be* all that is necessary in a woman. It is not simply that "strength and honor are her clothing," but she is about the only woman that has been evolved so far who is sure to have the right to "rejoice in time to come."

School Attendance in the United States

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

A STUDY has recently been made by the Sage Foundation to determine the rate at which children drop out of the elementary public schools of this country. The study covered the 386 principal cities in the United States. The results of the investigation, in a nutshell, are as follows:

For every eighteen children to enter the first year in the grammar school only ten remained in the fifth grade, five in the eighth, and but one remained to graduate from the high school. In other words, 94 per cent. of the children who entered the city school systems in the United States failed to complete the full twelve years which lead to a high school diploma.

There are no accurate statistics with regard to the children who enter the public schools in the rural districts, but observation leads to the conclusion that an even smaller proportion complete the high school course. The complaint is heard on all sides that the public schools do not prepare men and women for their life work, and in many quarters there is a demand for vocational and trade schools to fill this want. In Germany the attempt is being made to meet this demand by continuation schools. Regular attendance is required in the common schools until the age of fourteen is reached, and from fourteen until eighteen the boy is required to spend from twelve to sixteen hours a week in a continuation school. He enters a trade at fourteen, learning the practical side at a bench, and in the continuation school gets a theoretical training in the branch to which he intends to devote his life, which gives him a broad foundation and the chance to become a skilled workman. It is possible that practical training of this kind might serve to create a deeper interest in education and teach both parent and scholar the advantages of further training in the public school.
